tongue of the eldest to be cut off—had the skin torn from his head, and the extremities of his hands and feet cut off, before his mother and his brethren. After being mutilated, he was brought close to the fire, and fried in the pan. The second brother was then taken, and, after the hair of his head, with the skin, was torn away, he was tortured in the same manner as his elder brother; and in like manner, were the other five brethren put to death,—the last of whom, who was the youngest, he caused to be tortured more grievously than the rest. Last of all the mother also suffered death.†

Hearing, some time afterwards, that the Jews had revolted, he assembled all his troops, which formed a mighty army, and determined to destroy the whole Jewish nation, and to settle other people in their country. He commanded Lysias, one of his generals, to extirpate them root and branch, so as not to leave one Hebrew in the country. When in Persia advice was brought him of the defeat of Lysias, and that the Jews had retaken the temple, thrown down the altars and idols which he had set up, and re-established their ancient worship. At this news his fury rose to madness. In the violence of his rage, he set out with all possible expedition, like an infernal fiend, venting nothing but menaces on his march, and breathing only final ruin and destruction to every inhabitant of Judea, and to all that appertained to them. He commanded his coachman to drive with the utmost speed, that no time might be lost for fully satiating his vengeance, threatening at the same time, with horrid imprecations, to make Jerusalem the burying place of the whole Jewish nation, and not to leave one single inhabitant within its confines. But the Almighty, against whose providence he was raging, interposed, and stopped him in his wild career. "He was seized," says Rollin, "with incredible pains in his bowels, and the most excessive pangs of the colic." Still, his pride and fury were not abated: he suffered himself to be hurried away by the wild transport of his rage, and breathing nothing but vengeance against the land of Judea and its inhabitants, he gave orders to proceed with still greater celerity in his journey. But as his horses were running forward impetuously, he fell from his chariot, and bruised every part of his body in so dreadful a manner, that he suffered inexpressible torments; and soon after finished an impious life by a miserable death.

The Turks, in their wars with neighbouring states, both in former and present times, have been proverbial for the malevolence they have displayed, and the cruelties they have exercised towards their enemies. The following is only one instance out of a thousand which might be produced, of the desperate length to which human beings will proceed in treachery and in the in-

\* Rollin states the number at 80,000.

† The details of these shocking cruelties may be seen in Rollin's *Ancient History*, vol. 7.

fiction of torment, when under the influence of a principle of malignity.

In the war with Turkey and the states of Venice, about the year 1571, the Venetians were besieged by the Turks in the city of Famagosta in the island of Cyprus. Through famine and want of ammunition, the Venetian garrison was compelled to enter upon terms of capitulation. A treaty was accordingly set on foot, and hostages exchanged. The following terms were agreed to by both parties :—That the officers and soldiers should march out with all the honours of war, drums beating, colours flying, five pieces of cannon, all their baggage, and be conveyed in safety to Candia, under an escort of three Turkish galleys; and that the inhabitants should remain in the free use of their religion, untouched in their property, and in full possession of their freedom. Next day *Bragadino*, the Venetian commander, went to pay his compliments to *Mustapha*, the Turkish general, attended by some of his chief officers. At first they met with a civil reception, *Mustapha* ordering a seat to be placed for *Bragadino* on his own right hand.

They soon entered into discourse about the prisoners, and *Mustapha* taxing *Bragadino* with some violences committed by the garrison during the suspension granted for settling a capitulation, *Bragadino*, with a generous disdain, denied the charge. Upon which *Mustapha*, rising up in a fury, ordered him to be bound hand and foot, and the others to be massacred before his face, without regard to hospitality, their bravery, the treaty subsisting, or their being unarmed.

*Bragadino* was reserved for a more cruel treatment: after being insulted with the most vilifying and opprobrious language; after undergoing the most excruciating tortures; after having his ears, nose, and lips slit, his neck was stretched upon a block, and trampled upon by the dastardly *Mustapha*, who asked him where was now that *Christ* whom he worshipped, and why he did not deliver him out of his hands? At the same time the soldiers on board the fleet were despoiled of every thing, and lashed to the oars. This day's work being finished, *Mustapha* entered the city, where he gave immediate orders, that *Tiepolo*, a person of high rank and authority, should be hanged upon a gibbet. A few days after, before *Bragadino* had recovered from the wounds he had received, he was carried in derision to all the breaches made in the walls, loaded with buckets filled with earth and mortar, and ordered to kiss the ground as often as he passed by *Mustapha*, a spectacle that raised pangs of pity in the callous hearts of the meanest Turkish soldiers, but could not move compassion in the obdurate breast of *Mustapha*. Afterwards, the brave *Bragadino* was cooped up in a cage, and ignominiously hung to a sail-yard in one of the galleys, where his intrepid soldiers were chained to the oars. This sight rendered them almost

furious: they exclaimed against the baseness, the treachery of *Mustapha*; they called aloud for revenge, and desired to be set at liberty, that they might, even without arms, rescue their brave general, and inflict the deserved punishment upon their mean, dastardly, and cowardly foes. Their request was answered with cruel lashes. *Bragadino* was taken down, conducted to the market-place, amidst the din of trumpets, drums, and other warlike instruments, where he was *slayed alive*, and a period put to his glorious life. His skin was hung, by way of trophy, to the sail-yard of a galley sent round all the coasts to insult the Venetians. His head, with those of *Andrea Bragadino*, his brother, *Lodovico Martinenga*, and the brave *Quirino*, were sent as presents to *Selim* the Turkish Emperor.\*

Could an infernal fiend have devised more excruciating tortures, or have acted with greater baseness and malignity than this treacherous and cruel monster? What a horrible thing would it be to be subjected to the caprice and under the control of such a proud and vindictive spirit every day, only for a year, much more for hundreds and thousands of years! A group of such spirits giving vent to their malevolent passions without control, are sufficient to produce a degree of misery among surrounding intelligences, surpassing every thing that the human mind, in the present state, can possibly conceive.

When the Norman barons and chevaliers, under William the Conqueror, had obtained possession of England, they displayed the most cruel and malignant dispositions towards the native inhabitants. They afflicted and harassed them in every state, forcing them to work at the building of their castles; and when the castles were finished, they placed on them a garrison of wicked and diabolical men. They seized all whom they thought to possess any thing—men and women—by day and night; they carried them off; imprisoned them; and, to obtain from them gold or silver, inflicted on them tortures such as no martyrs ever underwent. Some they suspended by their feet, with their heads hanging in smoke; others were hung by the thumb, with fire under their feet. They pressed the heads of some by a leathern thong, so as to break the bones, and crush the brain: others were thrown into ditches full of snakes, toads, and other reptiles; others were put in the *chambre à crucif*. This was the name given in the Norman tongue to a sort of chest, short, strait, and shallow, lined with sharp stones, into which the sufferer was crammed to the dislocation of his limbs.—In most of the castles was a horrible and frightful engine used for putting to the torture. This was a bundle of chains so heavy that two or three men could hardly lift them. The unfortunate person upon whom

\* See "Modern Universal History," vol. 25, pp. 405, 406.

they were laid, was kept on his feet by an iron collar fixed in a post, and could neither sit, nor lie, nor sleep. They made many thousands die of hunger. They laid tribute upon tribute on the towns and villages. When the townspeople had no longer any thing to give, they plundered and burned the town. You might have travelled a whole day without finding one soul in the towns, or in the country one cultivated field. The poor died of hunger, and they who had formerly possessed something, now begged their bread from door to door. Never were more griefs and woes poured upon any land;—nay the Pagans in their invasions caused fewer than the men of whom I now speak. They spared neither the church-yards, nor the churches; they took all that could be taken, and then set fire to the church. To till the ground had been as vain as to till the sand on the seashore.\*

What scenes of wretchedness do such proud and malignant demons produce even in the present world! Can such spirits be supposed qualified for joining the general assembly and church of the first-born, and for taking a part in the beneficent operations of heaven? If they exist at all in a future world, they must exist in misery; and so long as such diabolical passions continue to rage, they must produce "lamentation and wo" among all the associates with which they are surrounded.—Even within the confines of mortality, the man who is under the despotic sway of pride, ambition, and similar malevolent passions, imbitters every enjoyment he might otherwise possess, produces pain in the minds of others, and experiences in his own soul pangs similar in kind to those which are felt in the place of punishment. I shall illustrate this position by the spirit and temper displayed by two illustrious individuals who have lately departed to the invisible state;—the one renowned in the political, the other in the literary world.

The first character to which I allude is that of *Napoleon Buonaparte*. This extraordinary man, who for nearly twenty years dazzled the whole Eastern hemisphere, like a blazing meteor, appears to have been actuated by the most extravagant and restless ambition. Though he exercised many cruelties in the midst of his career, as at Jaffa and other places, yet delight in deeds of atrocity formed no part of his ruling passion, and were only occasionally resorted to, in order to accomplish his ambitious projects. The agitated state of mind into which he was thrown by his love of conquest, and the daring enterprises in which he embarked, is strikingly depicted by M. Segur, in his "*History of Napoleon's Expedition to Russia*." When at Vitepsk, on his way to Moscow, M. Segur says—"He at first hardly appeared bold enough

to confess to himself a project of such great temerity—[the marching against Moscow.] But by degrees he assumed courage to look it in the face. He then began to deliberate, and the state of great irresolution which tormented his mind, affected his whole frame. He was observed to wander about his apartments, as if pursued by some dangerous temptation: nothing could rivet his attention; he every moment began, quitted, and resumed his labour; he walked about without any object; inquired the hour, and looked at his watch;—completely absorbed, he stopped, hummed a tune with an absent air, and again began walking about. In the midst of his perplexity, he occasionally addressed the persons whom he met with such half sentences as 'Well—What shall we do!—Shall we stay where we are, or advance?—How is it possible to stop short in the midst of so glorious a career?' He did not wait for their reply, but still kept wandering about, as if he was looking for something, or somebody, to terminate his indecision.—At length, quite overwhelmed with the weight of such an important consideration, and oppressed with so great an uncertainty, he would throw himself on one of the beds which he had caused to be laid on the floor of his apartments. His frame, exhausted by the heat and the struggles of his mind, could only bear a covering of the slightest texture. It was in that state that he passed a portion of his day at Vitepsk."

The same restless agitations seemed to have accompanied him at every step in this daring expedition. "At Borodino," says the same writer, "his anxiety was so great as to prevent him from sleeping. He kept calling incessantly to know the hour, inquiring if any noise was heard, and sending persons to ascertain if the enemy was still before him,—Tranquillized for a few moments, anxiety of an opposite description again seized him. He became frightened at the destitute state of the soldiers, &c. He sent for Bessieres, that one of his marshals in whom he had the greatest confidence:—he called him back several times, and repeated his pressing questions, &c. Dreading that his orders had not been obeyed, he got up once more, and questioned the grenadiers on guard at the entrance of his tent, if they had received their provisions. Satisfied with the answer, he went in, and soon fell into a doze. Shortly after he called once more. His aid-de-camp found him now supporting his head with both his hands; he seemed, by what was overheard, to be meditating on the *vanities of glory*.—'*What is war? A trade of barbarians, the whole art of which consists in being the strongest on a given point.*' He then complained of the fickleness of fortune, which he now began to experience. He again tried to take some rest. But the marches he had just made with the army, the fatigues of the preceding days and nights, so many cares, and his

\* Thierry's "*History of the Norman Conquest*," 3 vols. 1835.

intense and anxious expectations, had worn him out. An irritating fever, a dry cough, and excessive thirst consumed him. During the remainder of the night he made vain attempts to quench the burning thirst that consumed him."

What man that ever enjoyed the pleasures of tranquillity, would envy such a state of mind as that which has now been described, although the individual were surrounded with every earthly glory? Such mad ambition as that which raged in the breast of this singular personage, must be a perpetual torment to its possessor, in whatever region of the universe he exists, and must produce baleful effects on every one within the sphere of its influence.—The coolness with which such characters calculate on the destruction of human life, and the miseries which their lawless passions produce on their fellow-creatures, appears in the following extract.

"He asked Rapp, if he thought we should gain the victory? 'No doubt,' was the reply, 'but it will be sanguinary.' 'I know it,' resumed Napoleon, 'but I have 80,000 men; I shall lose 20,000; I shall enter Moscow with 60,000; the stragglers will then rejoin us, and afterwards the battalions on the march; and we shall be stronger than we were before the battle.'"

The other personage to whom I alluded is Lord Byron.

The following sketches of his character are taken from "Recollections of the life of Lord Byron, from the year 1808 to the year 1818. Taken from authentic documents, &c. by R. C. Dallas, Esq."

"He reduced his palate," says Mr. Dallas, "to a diet the most simple and abstemious—but the passions of his heart were too mighty; nor did it ever enter his mind to overcome them. Resentment, anger, and hatred, held full sway over him; and his greatest gratification at that time, was in overcharging his pen with gall, which flowed in every direction, against individuals, his country, the world, the universe, creation, and the Creator.—Misanthropy, disgust of life, leading to skepticism and impiety, prevailed in his heart, and embittered his existence. Unaccustomed to female society, he at once dreaded and abhorred it. As for domestic happiness he had no idea of it. 'A large family,' he said, 'appeared like opposite ingredients, mixed per force in the same salad, and I never relished the composition.' He was so completely disgusted with his relations, especially the female part of them, that he completely avoided them. 'I consider,' said he, 'collateral ties as the work of prejudice, and not the bond of the heart, which must choose for itself unshackled.'—In correspondence with such dispositions and sentiments, "he talked of his relation to the Earl of Carlisle with indignation." Having received from him a frigid letter, "he determined to lash his rela-

tion with all the gall he could throw into satire."—He declaimed against the ties of consanguinity, and abjured even the society of his sister, from which he entirely withdrew himself, until after the publication of "Childe Harold," when at length he yielded to my persuasions, and made advances to a friendly correspondence."

Here we have a picture of an individual, in whom "resentment, anger, and hatred," reigned without control: who could vent his rage even against the Creator, and the universe he had formed, who hated his fellow-creatures, and even his own existence; who spurned at the ties of relationship, and "abjured even the society of his sister." What horrible mischiefs and miseries would a character of this description produce, were such malevolent passions to rage with unbounded violence, without being checked by those restraints, which human laws impose in the present state!

I shall state only another example of this description, taken from Captain Cochrane's "Travels in Russia."—On arriving at the Prussian frontiers, says the captain, "My passport demanded, myself interrogated by a set of whiskered ruffians, obliged to move from one guard to another, the object of sarcasm and official tyranny, I wanted no inducement, fatigued as I was, to proceed on my journey, but even this was not permitted me. A large public room, full of military rubbish, and two long benches serving as chairs, to an equally long table, were the place and furniture allotted me. I asked the landlord for supper; he laughed at me; and to my demand of a bed, grinningly pointed to the floor, and refused me even a portion of the straw which had been brought in for the soldiers. Of all the demons that ever existed, or have been imagined in human shape, I thought the landlord of the inn the blackest. The figure of Gil Peres occurred to me, but it sunk in the comparison with the wretch then before me for ill nature, malignity, and personal hideousness. His face half covered with a black beard, and large bristly whiskers, his stature below the common, his head sunk between his shoulders to make room for the protuberance of his back; his eyes buried in the ragged locks of his lank grisly hair;—added to this a club foot, and a voice which, on every attempt to speak, was like the shrieking of a screech-owl,—and you have some faint idea of this mockery of a man."—Here, we have presented to view a human being, who, in the malignity of his mind, and in the conformation of his body, bears a certain resemblance to those wretched beings in whose hearts benevolence never glows, and in whose dwellings nothing is seen but the most haggard and deformed objects, and nothing heard but horrid imprecations, and the sounds of woe.

Let us now suppose, for a moment, a vast

assemblage of beings of the description to which I have adverted, collected in a dark and dreary region. Let us suppose many thousands of millions of such characters as *Nero*, who set fire to Rome, that he might amuse himself with the wailings and lamentations which this calamity inspired, and insulted Heaven by offering thanksgivings to the gods, after murdering his wife and his mother,—*Tiberius* who delighted in torturing his subjects, and massacring them in the most tormenting and cruel manner,—*Caligula*, celebrated in the annals of folly, cruelty, and impiety, who murdered many of his subjects with his own hand, and caused thousands who were guilty of no crimes to be cruelly butchered,—*Antiochus Epiphanes*, who butchered forty thousand of the inhabitants of Jerusalem in cold blood, and rushed forward, like an infernal demon, with the intention of destroying every inhabitant of Judea,—*Hamileer*, who threw all the prisoners that came into his hand, to be devoured by wild beasts,—*Asdrubal*, who put out the eyes of all the Roman captives he had taken during two years, cut off their noses, fingers, legs, and arms, tore their skin to pieces with iron rakes and harrows, and threw them headlong from the top of his battlements,—*Jenghiz Khan*, who caused seventy chiefs to be thrown into as many caldrons of boiling water, and took pleasure in beholding his army beheading a hundred thousand prisoners at once,—*Tamerlane*, who displayed his sportive cruelty in pounding three or four thousand people in large mortars, or building them among bricks and mortar into a wall,—*Mustapha*, who treacherously murdered the Venetian officers, after having entered into a treaty with them, and who beheld with delight the noble-minded Bragadino, whom he had cruelly tortured, flayed alive,—*Buonaparte*, whose mad ambition sacrificed so many millions of human beings, and Lord Byron,\* in whose breast “resentment, anger, and hatred,” raged with violence, and who made his gall flow out “against individuals, his country, the world, the universe, creation, and the Creator;”—let us suppose such characters associated together in a world where no pleasing objects meet the eye, or cheer the heart and imagination; and let us likewise suppose, that the malignant principles and boisterous passions which reigned in their minds during the present state, still continue to rage with uncontrolled and perpetual

\* The Author trusts, that none of his readers will for a moment suppose, that, in bringing forward the above-mentioned characters as examples of malignity, he presumes to decide on their eternal destiny. His object merely is to show, that such malignant principles and passions as they displayed in the general tenor of their conduct, if resolutely persisted in, necessarily led to misery. With regard to Buonaparte and Lord Byron, he is disposed to indulge a hope, that their malevolent dispositions were in some measure counteracted, before they passed into the eternal world. The grounds of his hope, on this point, are stated in the Appendix.

violence against all surrounding associates; it is evident, that, in such a case, a scene of misery would be produced, beyond the power of the human mind either to conceive or to describe. If so dreadful effects have been produced, by such diabolical passions, even in the present world, where Providence “sets restraining bounds to the wrath of man,” and where benignant dispositions are blended with the evil principles which so generally prevail, what must be the effects where *pure malignity*, without any mixture of benevolent feelings, reigns universally, is perpetually tormenting its objects, is ever increasing in its fury, and is never controlled by physical obstructions or by moral considerations! This is the society of hell: this is the essence of future misery: this is “the worm that never dies, and the fire that is never quenched;” and the natural effects produced by it is universal anguish and despair,—“weeping, and wailing, and gnashing of teeth.”—If such be the end of the ungodly, and the malignant despiser of God’s law, and the riches of his mercy as manifested in Christ Jesus,—how careful should we be to counteract every evil propensity and passion, and how fervently ought we to join in the prayer of the Psalmist, and in the resolution of Jacob: “Gather not my soul with sinners, nor my life with bloody men.” “O my soul, come not thou into their secret; unto their assembly, mine honour, be not thou united!”

Let none imagine, because I have selected some of the more atrocious characters recorded in history, as illustrations of the effects of depravity—that only such are “vessels of wrath, fitted for destruction.” The principle of malevolence is substantially the same in every heart where it is predominant, however much it may be varnished over by hypocrisy, dissimulation, and the various forms of politeness which prevail in the world; and it requires only a certain stimulus to excite it to action, and full scope to exert its energies, in order to produce the most horrible and extensive effects. Several of the atrocious characters to which I have alluded, appeared, in the commencement of their career, to be possessed of a certain portion of benevolence, and of other amiable qualities. Nero, in the beginning of his reign, showed several marks of the greatest kindness and condescension, affability, complaisance, and popularity. When he was desired to sign his name to a list of malefactors that were to be executed, he exclaimed, “*Would to Heaven I could not write!*”—Caligula began his reign with every promising appearance of becoming the real father of his people. Tiberius at first concealed his thoughts under the mask of an impenetrable dissimulation. He governed with moderation, and even appeared to excel in modesty. But afterwards, when these individuals became intoxicated with power,

and had thrown aside all considerations of morality and decorum, the latent principles of malignity burst forth in all their violence, till they became a scourge and an execration to mankind. So will it happen with those who now harbour malicious and vindictive passions, under a cloak of dissimulation and fashionable politeness, when they enter the invisible world under the dominion of such affections. When the restraints of society, of common decorum, and of human laws, are completely removed; when they have lost all hopes of the divine mercy; when they find themselves surrounded by none but malignant associates, and when they feel the effects of their infernal malice and revenge—those passions, which sometimes lay dormant in this life, will be roused into action, and rage with ungovernable fury against every one around, against themselves, “against the universe, and against the Creator.”

Nor let it be imagined, that God will interpose at the hour of death, and, by an exertion of his power and benevolence, destroy the principles of sin, and prepare such characters for the joys of heaven. Such an interference, in every individual case, would imply a continued miracle, and would be inconsistent with the established order of the divine government; as it would supersede the use of all those instructions, admonitions, and moral preparations which God hath appointed for rendering his people “meet for the inheritance of the saints in light;” and would prevent the moral renovation of the world, which is now gradually effecting by the exertions of those who are “renewed in the spirit of their minds.” It is true, indeed, that the mercy of God is infinite, and that so long as there is life, there is hope;—so that the most abandoned sinner has no reason to despair, while he remains within the confines

of the present state. But as for those who pass from time into eternity, evidently under the power of revengeful and depraved passions, we have but slender grounds on which to hope that they shall ever afterwards be prepared for the felicity of heaven.

From the whole of what I have stated in this department of my subject, it is evident, that there are *two different states* in the future world; or, in other words, a *heaven* and a *hell*; a state of happiness, and a state of misery. If human beings are to exist at all in another region of creation, and throughout an unlimited duration, it is necessary that there be a separation effected, on the ground of their leading dispositions and characters. The nature of things, the moral constitution of the universe, and the happiness of the intelligent creation, as well as the decree of the Creator, require, that such an arrangement should take place. For it is altogether incompatible with the laws of moral order, that pride, hatred, malignity, and revenge, should dwell in the same abode with humility, benevolence, friendship, and love; or, that beings, actuated by principles and affections diametrically opposite to each other, could engage with harmony in the same employments, and relish the same pleasures. Were such an incongruous association permitted, the moral universe would soon become a scene of universal anarchy, and happiness be banished from all worlds. So that the two states of immortality revealed in Scripture, are equally accordant with the dictates of reason, and with the declaration of our Saviour, who has solemnly assured us, that “the wicked shall depart into everlasting punishment, and the righteous into life eternal.”

## APPENDIX.

THE following facts and documents, in relation to Lord Byron, lead us to indulge the hope, that, prior to his dissolution, he was actuated by sentiments and dispositions, different from those which are stated at page 122.

The lady of Mr. John Shepherd of Frome, having died some time ago, leaving amongst her papers, a prayer which her husband believed to have been composed on behalf of the noble poet, Mr. Shepherd addressed it to his Lordship, which called forth the reply which is here subjoined.

*Frome, Somerset, Nov. 21st, 1821.*

*To the Right Honourable Lord Byron, Pisa.*

MY LORD,—More than two years since, a lovely and beloved wife was taken from me, by lingering disease, after a very short union. She possessed unvarying gentleness and fortitude, and a piety so retiring, as rarely to disclose itself in words, but so influential, as to produce uniform benevolence of conduct. In the last hour of life, after a farewell look on a lately born and only infant, for whom she had evinced inexpressible affection, her last whispers were, "God's happiness! God's happiness!" Since the second anniversary of her decease, I have read some papers which no one had seen during her life, and which contained her most secret thoughts. I am induced to communicate to your Lordship a passage from these papers, which, there is no doubt, refers to yourself; as I have more than once heard the writer mention your agility on the rocks at Hastings:—

"O my God, I take encouragement from the assurance of thy word, to pray to Thee in behalf of one for whom I have lately been much interested. May the person to whom I allude, (and who is now, we fear, as much distinguished for his neglect of Thee, as for the transcendent talents Thou hast bestowed on him) be awakened to a sense of his own danger, and led to seek that peace of mind in a proper sense of religion, which he has found this world's enjoyments unable to procure. Do thou grant that his future example may be productive of far more extensive benefit, than his past conduct and writings have been of evil; and may the Sun of Righteousness, which, we trust, will, at some future period, arise upon him, be bright in proportion to the darkness of those clouds which guilt has raised, and soothing in proportion to the keenness of that agony which the punishment of his vices has inflicted on him! May the hope, that

the sincerity of my own efforts for the attainment of holiness, and the approval of my own love to the great Author of religion, will render this prayer, and every other for the welfare of mankind, more efficacious—cheer me in the path of duty; but let me not forget, that, while we are permitted to animate ourselves to exertion, by every innocent motive, these are but the lesser streams which may serve to increase the current, but which, deprived of the grand fountain of good, (a deep conviction of inborn sin, and firm belief in the efficacy of Christ's death, for the salvation of those who trust in him, and really seek to serve him) would soon dry up, and leave us as barren of every virtue as before.—*Hastings, July 31st, 1814.*"

There is nothing, my Lord, in this extract, which, in a literary sense, can at all interest you; but it may, perhaps, appear to you worthy of reflection, how deep and expansive a concern for the happiness of others, a Christian faith can awaken in the midst of youth and prosperity.—Here is nothing poetical and splendid, as in the exostulatory homage of M. Delamartine; but here is the sublime, my Lord; for this intercession was offered on your account, to the supreme Source of happiness. It sprang from a faith more confirmed than that of the French poet, and from a charity, which, in combination with faith, showed its power unimpaired amidst the languors and pains of approaching dissolution. I will hope, that a prayer, which, I am sure, was deeply sincere, may not be always unavailing.

It would add nothing, my Lord, to the fame with which your genius has surrounded you, for an unknown and obscure individual to express his admiration of it. I had rather be numbered with those who wish and pray, that "wisdom from above," and "peace," and "joy," may enter such a mind.

### THE ANSWER.

*Pisa, Dec. 8th, 1821.*

SIR,—I have received your letter. I need not say that the extract which it contains has affected me, because it would imply a want of all feeling to have read it with indifference. Though I am not quite sure that it was intended by the writer for me, yet the date, the place where it was written, with some other circumstances, which you mention, render the allusion probable. But, for whomsoever it was meant, I have read it with all the pleasure which can arise

from so melancholy a topic. I say, *pleasure*, because your brief and simple picture of the life and demeanor of the excellent person whom I trust that you will again meet, cannot be contemplated without the admiration due to her virtues, and her pure and unpretending piety. Her last moments were particularly striking; and I do not know, that in the course of reading the story of mankind, and still less in my observations upon the existing portion, I ever met with any thing so unostentatiously beautiful. Indisputably, the firm believers in the gospel have a great advantage over all others—for this simple reason, that if true, they will have their reward hereafter; and if there be no hereafter, they can be but with the infidel in his eternal sleep, having had the assistance of an exalted hope through life, without subsequent disappointment, since (at the worst of them) "out of nothing, nothing can arise," not even sorrow. But a man's creed does not depend upon himself; who can say, I will believe this, that, or the other? and least of all that which he least can comprehend? I have, however, observed, that those who have begun with extreme faith, have in the end greatly narrowed it, as Chillingworth, Clark, (who ended as an Arian,) and some others; while on the other hand, nothing is more common, than for the early skeptic to end in a firm belief, like Maupertius and Henry Kirke White. But my business is to acknowledge your letter, and not to make a dissertation. I am obliged to you for your good wishes, and more obliged by the extract from the papers of the beloved object whose qualities you have so well described in a few words. I can assure you, that all the fame which ever cheated humanity into higher notions of its own importance, would never weigh on my mind against the pure and pious interest which a virtuous being may be pleased to take in my welfare. In this point of view, I would not exchange the prayer of the deceased in my behalf, for the united glory of Homer, Cæsar, and Napoleon, could such be accumulated upon a living head. Do me the justice to suppose, that "*video meliora proboque*," however the "*deteriora sequor*" may have been applied to my conduct. I have the honour to be your obliged and obedient servant,

BYRON.

P. S. I do not know that I am addressing a clergyman; but I presume that you will not be affronted by the mistake (if it is one) on the address of this letter. One who has so well explained, and deeply felt, the doctrines of religion, will excuse the error which led me to believe him its minister.

This letter, every one will admit, exhibits Lord Byron in a much more amiable point of view than the traits of his character sketched by Mr. Dallas, prior to the year 1818. The fol-

lowing account of his death, and sentiments: extracted from "Last days of Lord Byron."

A very few days before his Lordship's death, Mr. Parry relates:—"It was seven o'clock in the evening when I saw him, and then I took a chair at his request, and sat down by his bedside, and remained till ten o'clock. He sat up in his bed, and was then calm and collected. He talked with me on a variety of subjects, connected with himself and his family. He spoke of death also with great composure, and thought he did not believe his end was so very near, there was something about him so serious and so firm, so resigned and composed, so different from any thing I had ever before seen in him, that my mind misgave, and at times foreboded his speedy dissolution. 'Parry,' he said, when I first went to him, 'I have much wished to see you to-day. I have had most strange feelings, but my head is now better. I have no gloomy thoughts, and no idea but I shall recover. I am perfectly collected—I am sure I am in my senses—but a melancholy will creep over me at times.' The mention of the subject brought the melancholy topics back, and a few exclamations showed what occupied Lord Byron's mind when he was left in silence and solitude. 'My wife! my Ada! my country! the situation of this place—my removal impossible, and perhaps death—all combine to make me sad. I am convinced of the happiness of domestic life. No man on earth respects a virtuous woman more than I do; and the prospect of retirement in England, with my wife and Ada, gives me an idea of happiness I have never experienced before. Retirement will be every thing to me, for heretofore to me life has been like the ocean in a storm. You have no conception of the unaccountable thoughts which come into my mind when the fever attacks me.—Eternity and space are before me, but on this subject, thank God, I am happy and at ease. The thought of living eternally, of again reviving, is a great pleasure. Christianity is the purest and most liberal religion in the world, but the numerous teachers who are continually worrying mankind with their denunciations and their doctrines, are the greatest enemies of religion. I have read with more attention than half of them the Book of Christianity, and I admire the liberal and truly charitable principles which Christ has laid down. There are questions connected with this subject which none but Almighty God can solve. Time and space who can conceive? None but God—on him I rely.'"

Who knows but the prayer of the amiable young lady, inserted above, was the mean of leading his Lordship to indulge such sentiments, and of ultimately securing his eternal happiness! "The effectual fervent prayer of a righteous man availeth much." This consideration should not only excite us to offer up intercessions in behalf of particular individuals, but also to use

every prudent and delicate mean—by conversation, epistolary correspondence, or otherwise, to rouse the attention of those, especially in the higher circles of life, who appear unconcerned about “the things which relate to their everlasting peace.”

The following lines, written by Lord Byron, are said to have been found in his Bible :—

“ Within this awful volume lies  
The mystery of mysteries.  
Oh ! happiest they of human race,  
To whom our God has given grace,  
To hear, to read, to fear, to pray,  
To lift the latch, and force the way ;  
But better had they ne’er been born,  
Who read to doubt, or read to scorn.”

With regard to *Buenaparte*, we have nothing so satisfactory as in the case of Byron, that might lead us to conclude that his moral and religious sentiments were changed for the better. In his solitude at St. Helena, however, it appears that the subject of religion occasionally occupied his attention. The following anecdote,

extracted from La Casas’ Journal, will show the opinion which he entertained of the morality of the New Testament :—

In a conversation on the subject of religion, which he had with his friends at St. Helena, he said, among many other things, “ ‘ How is it possible that conviction can find its way to our hearts, when we hear the absurd language, and witness the acts of iniquity of the greatest number of those whose business it is to preach to us ? I am surrounded with priests who preach incessantly that their reign is not of this world, and yet they lay hands upon every thing they can get. The Pope is the head of that religion from heaven, and he thinks only of this world,’ &c. The Emperor ended the conversation by desiring my son to bring him the New Testament, and taking it from the beginning, he read as far as the conclusion of the speech of Jesus on the mountain. *He expressed himself struck with the highest admiration at the purity, the sublimity, the beauty of the morality it contained, and we all experienced the same feeling.*”

## PREFACE.

---

To delineate the moral bearings of the Christian Revelation, — to display the reasonableness and the excellence of its precepts, and the physical and rational grounds on which they rest, — and to exhibit a few prominent features in the moral aspect of the world, — were some of the principal objects which the author had in view in the composition of the following work. He is not aware that a similar train of thought has been prosecuted, to the same extent, by any preceding writer; and is therefore disposed to indulge the hope that it may prove both entertaining and instructive to the general reader, and to the intelligent Christian.

It may not be improper to remind the reader that the author's object simply is, to *illustrate* the topics he has selected as the subject of this volume. As he has taken his fundamental principles from the system of revelation, he was under no necessity, as most ethical writers are, to enter into any laboured metaphysical discussions on the *foundation* of morality, and the motives from which moral actions should proceed. — The truth of revelation is, of course, taken for granted; and all who acknowledge its divine authority, will readily admit the principles which form the basis of the system here illustrated. But, although it formed no particular part of the author's plan to illustrate the *evidences* of the Christian revelation, he trusts that the view which is here given of the benignant tendency of its moral requisitions, will form a powerful presumptive argument in support of its celestial origin.

The Christian reader may also be reminded, that it is only the *philosophy* of religion which the author has attempted to illustrate. It formed no part of his plan to enter into any particular discussion on the *doctrines* of revelation, or on those topics which have so frequently been the subject of controversy in the Christian church. It is not to support the tenets of Calvinism, Arminianism, Baxterianism, Arianism, or any other *ism* which distinguishes the various denominations of the religious world, that these illustrations are presented to public view; but to elucidate an object which it appears to be the grand design of revelation to accomplish, and in the promotion of which every section of the Christian church is equally interested, and to which they would do well to "take heed." — In his illustration of this subject, the author has kept his eye solely on the two revelations which the Almighty has given to mankind, — THE SYSTEM OF NATURE, and the SACRED RECORDS *just as they stand*, — without any regard to the theories of philosophers, the opinions of commentators, or the systems of theologians. He is disposed to view the revelations of the Bible rather as a series of important *facts*, from which moral instructions are to be deduced, than as a system of metaphysical opinions for the exercise of the intellect.

## PREFACE.

On the leading topics which have divided the Christian world, the author has formed his own opinion, and has adopted those which he has judged, on the whole, to be most correct; but it is of no importance to the reader what these opinions are, or of what system of speculative theology he is inclined, on the whole, to support. He sets very little value upon purely speculative opinions, except in so far as they tend to promote the grand moral objects of Christianity; and while he assumes the unalienable right of thinking for himself on the subject of religion, he is disposed to allow the same privilege to others. He believes, on the authority of Scripture, that "God is the Creator of heaven and earth;"—that "he is righteous in all his ways, and holy in all his works;"—that "he is good to all, and that his tender mercies are over all his works;"—that "he so loved the world, that he gave his only begotten Son, that whosoever believeth on him might not perish, but have everlasting life;"—that "Christ died for our sins, that he was buried, and that he rose again from the dead according to the Scriptures;"—that "he is the propitiation for our sins, and that he ever lives to make intercession;"—together with all the other facts and doctrines with which these are essentially connected. But he views the recognition of such doctrines and facts not as the *end* of religion, but only as the *means* by which the great moral objects of Christianity are to be promoted and accomplished.

In illustrating the moral state of the world, the author is sorry that he was obliged to compress his details within so narrow limits. Few readers, however, will appreciate the labour and research he was under the necessity of bestowing, in order to select and arrange the facts which he has detailed. He has occasionally had to condense a long history or narrative, and even a whole volume, into the compass of two or three pages; and to search through more than twenty volumes, in order to find materials to fill a couple of pages. With the same degree of research, (excepting the mechanical labour of transcription,) he might have filled several volumes with similar illustrations; and he is convinced that a work of this description, judiciously executed, would prove highly instructive, as well as entertaining, not only to the Christian world, but to readers of every description.

Various topics connected with the philosophy of religion still remain to be illustrated. These shall form the subject of discussion in a future volume, should the present work be received with general approbation.

PERTH, *January, 1826.*

## INTRODUCTION.

THE objects of human knowledge may be reduced to two classes—the relations of *matter* and the relations of *mind*; or, in other words, the *material* and the *intellectual* universe. Of these two departments of science, the intellectual universe is, in many respects, the most interesting and important. For, in so far as our knowledge and researches extend, it appears highly probable, if not absolutely certain, that the material universe exists solely for the sake of sentient and intelligent beings—in order to afford a sensible manifestation of the attributes of the great First Cause, and to serve as a vehicle of thought and a medium of enjoyment to subordinate intelligences. So intimately related, however, are these two objects of human investigation, that a knowledge of the one cannot be obtained but through the medium of the other. The operations of mind cannot be carried on without the intervention of external objects; for if the material universe had never existed, we could never have prosecuted a train of thought;\* and the beauties and sublimities of external nature can be perceived only by thinking beings, without the existence of which, the material universe would remain like a mighty blank, and might be said to have been created in vain. Hence it appears, that, previous to our inquiries

\* The whole train of ideas which passes through our minds on any subject may be considered as the images of external objects variously modified and combined. These images we receive through the medium of our senses, by which we hold a communication with the material world. All our ideas of God, and of the objects of religion, are derived from the same source. The illustrations of the attributes of the Deity, and of his moral administration, contained in Scripture, are derived from the external scenes of creation, and from the relations of human society; consequently, had the material world never existed, we could have formed no conceptions of the divine perfections similar to those which we now entertain, nor have prosecuted a train of thought on any other subject; for the material universe is the basis of all the knowledge we have hitherto acquired, or can acquire, respecting ourselves, our Creator or other intelligences. Any person who is disposed to call in question this position must be prepared to point out, distinctly and specifically, those ideas or trains of thought which are not derived through the medium of the external senses, and from the objects on which they are exercised.

into the nature and relations of mind, it is necessary, in the first place, to study the phenomena of the material world, and the external actions of all those percipient beings with which it is peopled; for the knowledge of the facts we acquire in relation to these objects must form the ground-work of all our investigations.

We are surrounded, on every hand, with minds of various descriptions, which evince the faculties of which they are possessed, by the various senses and active powers with which they are furnished. These minds are of various gradations, in point of intellectual capacity and acumen, from man downwards through all the animated tribes which traverse the regions of earth, air, and sea. We have the strongest reason to believe, that the distant regions of the material world are also replenished with intellectual beings, of various orders, in which there may be a *gradation* upwards, in the scale of intellect above that of a man, as diversified as that which we perceive in the descending scale, from man downwards to the immaterial principle which animates a muscle, a snail, or a microscopic animalcula. When we consider the variety of original forms and of intellectual capacities which abounds in our terrestrial system, and that there is an infinite gap in the scale of being between the human mind and the Supreme Intelligence, it appears quite conformable to the magnificent harmony of the universe, and to the wisdom and benevolence of its Almighty Author, to suppose, that there are beings within the range of his dominions as far superior to man in the comprehension and extent of mental and corporeal powers, as man is, in these respects, superior to the most despicable insect: and that these beings, in point of number, may exceed all human calculation and comprehension. This idea is corroborated by several intimations contained in the records of revelation, where we have presented to our view a class of intelligences endowed with physical energies, powers of rapid motion, and a grasp of intellect, incomparably superior to those which are possessed by any of the beings which belong to our sublunary system.

THE  
PHILOSOPHY OF RELIGION.

---

INTRODUCTION.

THE objects of human knowledge may be reduced to two classes—the relations of *matter* and the relations of *mind*; or, in other words, the *material* and the *intellectual* universe. Of these two departments of science, the intellectual universe is, in many respects, the most interesting and important. For, in so far as our knowledge and researches extend, it appears highly probable, if not absolutely certain, that the material universe exists solely for the sake of sentient and intelligent beings—in order to afford a sensible manifestation of the attributes of the great First Cause, and to serve as a vehicle of thought and a medium of enjoyment to subordinate intelligences. So intimately related, however, are these two objects of human investigation, that a knowledge of the one cannot be obtained but through the medium of the other. The operations of mind cannot be carried on without the intervention of external objects; for if the material universe had never existed, we could never have prosecuted a train of thought;\* and the beauties and sublimities of external nature can be perceived only by thinking beings, without the existence of which, the material universe would remain like a mighty blank, and might be said to have been created in vain. Hence it appears, that, previous to our inquiries

\* The whole train of ideas which passes through our minds on any subject may be considered as the images of external objects variously modified and combined. These images we receive through the medium of our senses, by which we hold a communication with the material world. All our ideas of God, and of the objects of religion, are derived from the same source. The illustrations of the attributes of the Deity, and of his moral administration, contained in Scripture, are derived from the external scenes of creation, and from the relations of human society; consequently, had the material world never existed, we could have formed no conceptions of the divine perfections similar to those which we now entertain, nor have prosecuted a train of thought on any other subject; for the material universe is the basis of all the knowledge we have hitherto acquired, or can acquire, respecting ourselves, our Creator or other intelligences. Any person who is disposed to call in question this position must be prepared to point out, distinctly and specifically, those ideas or trains of thought which are not derived through the medium of the external senses, and from the objects on which they are exercised.

into the nature and relations of mind, it is necessary, in the first place, to study the phenomena of the material world, and the external actions of all those percipient beings with which it is peopled; for the knowledge of the facts we acquire in relation to these objects must form the ground-work of all our investigations.

We are surrounded, on every hand, with minds of various descriptions, which evince the faculties of which they are possessed, by the various senses and active powers with which they are furnished. These minds are of various gradations, in point of intellectual capacity and acumen, from man downwards through all the animated tribes which traverse the regions of earth, air, and sea. We have the strongest reason to believe, that the distant regions of the material world are also replenished with intellectual beings, of various orders, in which there may be a *gradation* upwards, in the scale of intellect above that of a man, as diversified as that which we perceive in the descending scale, from man downwards to the immaterial principle which animates a muscle, a snail, or a microscopic animalcula. When we consider the variety of original forms and of intellectual capacities which abounds in our terrestrial system, and that there is an infinite gap in the scale of being between the human mind and the Supreme Intelligence, it appears quite conformable to the magnificent harmony of the universe, and to the wisdom and benevolence of its Almighty Author, to suppose, that there are beings within the range of his dominions as far superior to man in the comprehension and extent of mental and corporeal powers, as man is, in these respects, superior to the most despicable insect; and that these beings, in point of number, may exceed all human calculation and comprehension. This idea is corroborated by several intimations contained in the records of revelation, where we have presented to our view a class of intelligences endowed with physical energies, powers of rapid motion, and a grasp of intellect, incomparably superior to those which are possessed by any of the beings which belong to our sublunary system.

To contemplate the various orders of intelligences which people the material universe, and the relations which subsist among them—the arrangements of the different worlds to which they respectively belong—the corporeal vehicles by which they hold a correspondence with the material system—the relation in which they stand to other worlds and beings, from which they are separated by the voids of space—and the excursions they occasionally make to different regions of that vast empire of which they form a part—to trace the superior intellectual faculties and the sensitive organs with which they are endowed—the profound investigations they have made into the economy of the universe—the trains of thought which they pursue, and the magnificent objects on which their faculties are employed—the emotions with which they view the scenes and transactions of such a world as ours—the means by which they have been carried forward in the career of moral and intellectual improvement—the history of their transactions since the period at which they were brought into existence—the peculiar dispensations of the Creator, and the revolutions that may have taken place among them—the progressions they have made from one stage of improvement to another—the views they have acquired of the perfections and the plans of their Almighty Sovereign—the transporting emotions of delight which pervade all their faculties—and the sublime adorations they offer up to the Fountain of all their felicity—would constitute a source of the most exquisite gratification to every holy, intelligent, and inquiring mind. But, since we are at present confined to a small corner of the universe of God, and surrounded by immeasurable voids of space, which intervene between our habitation and the celestial worlds, through which no human power can enable us to penetrate, we must remain ignorant of the nature and economy of those intellectual beings, till our souls take their flight from these “tabernacles of clay,” to join their kindred spirits in the invisible world. While we remain in our sublunary mansion, our investigations into the world of mind must, therefore, of necessity, be confined to the nature and attributes of the Uncreated Spirit, and to the faculties of our own minds and those of the sensitive beings with which we are surrounded. These faculties, as they constitute the instruments by which all our knowledge, both human and divine, is acquired, have employed the attention of philosophers in every age, and have been the theme of many subtle and ingenuous speculations; and they, doubtless, form an interesting subject of investigation to the student of intellectual science.

But, of all the views we can take of the world of mind, the *moral relations* of intelligent beings, and the laws founded on these relations, are topics by far the most interesting and important. This subject may be treated in a more definite and

tangible manner than the theories which have been formed respecting the nature and operations of the intellectual powers. Illustrations level to every capacity, and which come home to every one's bosom, may be derived both from reason and experience, from the annals of history, and the records of revelation. It is not involved in the same difficulties and obscurity which have perplexed the philosophy of the intellect; and there are certain principles which may be traced in relation to this subject, which apply to all the rational intelligences that God has formed, however diversified in respect of the regions of the universe which they occupy, and in the extent of their intellectual powers. Above all, this subject is more intimately connected with the present and future happiness of man than any other which comes within the range of human investigation; and therefore, forms a prominent and legitimate branch of what may be termed “The Philosophy of Religion.”

That the moral relations of intelligent minds, and the temper and conduct corresponding with these relations, are essentially connected with the happiness of every rational agent, might be made to appear from a variety of cases, in which the reversing of certain moral laws or principles would inevitably lead to disorder and misery. I shall content myself with stating the following illustration:—We dwell in an obscure corner of God's empire; but the light of modern science has shown us, that worlds, a thousand times larger than ours, and adorned with more refulgent splendours, exist within the range of that system of which we form a part. It has also unfolded to our view other systems dispersed throughout the voids of space, at immeasurable distances, and in such vast profusion, that our minds are unable to grasp their number and their magnitude. Reason and revelation lead us to conclude, that all these worlds and systems are adorned with displays of divine wisdom, and peopled with myriads of rational inhabitants. The human mind, after it has received notices of such stupendous scenes, naturally longs for a nearer and more intimate inspection of the grandeur and economy of those distant provinces of the Creator's empire; and is apt to imagine, that it would never weary, but would feel unmingled enjoyment, while it winged its flight from one magnificent scene of creation to another. But although an inhabitant of our world were divested of the quality of gravitation endowed with powers of rapid motion adequate to carry him along “to the suburbs of creation,” and permitted by his Creator to survey all the wonders of the universe, if a principle of love and kindly affection towards fellow-intelligences did not animate his mind, if rage and revenge pride and ambition, hatred and envy, were incessantly rankling in his breast, he could feel no transporting emotions, nor taste the sweets of true enjoyment. The vast universe, through

which he roamed, would be transformed into a *specious hell*; its beauties and sublimities could not prevent misery from taking possession of his soul; and, at every stage of his excursion, he could not fail to meet with the indications of his Creator's frown. For there appears, from reason and experience, as well as from the dictates of revelation, an absolute impossibility of enjoying happiness so long as malevolent affections retain their ascendancy in the heart of a moral intelligence, in whatever region of universal nature his residence may be found.

Hence we may learn, that the highest attainments in science to which any one can arrive, though they may expand the range of his intellectual views, will not ensure to their possessor substantial and unmingled enjoyment, while his heart is devoid of benevolent affections, and while he is subjected to the influence of degrading and immoral passions. If it be possible that any one now exists in the literary world, who has devoted his life to the sublimest investigations of science, and has taken the most extensive views of the arrangements of the material world, and yet who remains doubtful as to the existence of a Supreme Intelligence, and of an eternal state of destination; who is elated with pride at the splendour of his scientific acquirements; who treats his equals with a spirit of arrogance; who looks down with a haughty and sullen scowl on the inferior ranks of his fellow-men; who is haughty, overbearing, and revengeful in his general deportment, and who is altogether indifferent as to the moral principles he displays,—I would envy neither his happiness nor his intellectual attainments. He can enjoy none of those delightful emotions which flow from the exercise of Christian benevolence, nor any of those consolations which the good man feels amidst the various ills of life; and, beyond the short span of mortal existence, he can look forward to no brighter displays of the grandeur of the material and intellectual universe, but to an eternal deprivation of his powers of intelligence in the shades of annihilation.

It must, therefore, be a matter deeply interesting to every intelligent agent, to acquire correct notions of the fundamental principles of moral action, and to form those habits which will fit him for the enjoyment of true felicity, to whatever region of the universe he may afterwards be transported.—In the illustration of this subject, I shall pursue a train of thought which I am not aware has been prosecuted by any previous writers on the subject of morality, and shall endeavour to confirm and illustrate the views which may be exhibited, by an appeal to the discoveries of revelation.

We have an abundance of ponderous volumes on the subject of moral philosophy; but the different theories which have been proposed and discussed, and the metaphysical mode in which

the subject has been generally treated, have seldom led to any beneficial practical results. To attempt to treat the subject of morals without a reference to divine revelation, as most of our celebrated moral writers have done, seems to be little short of egregious trifling. It cannot serve the purpose of an *experiment*, to ascertain how far the unassisted faculties of man can go in acquiring a knowledge of the foundation and the rules of moral action; for the prominent principles of Christian morality are so interwoven into the opinions, intercourses, and practices of modern civilized society, and so familiar to the mind of every man who has been educated in a Christian land, that it is impossible to eradicate the idea of them from the mind, when it attempts to trace the duty of man solely on the principles of reason. When the true principles of morality are once communicated through the medium of revelation, reason can demonstrate their utility, and their conformity to the character of God, to the order of the universe, and to the relations which subsist among intelligent agents. But we are by no means in a situation to determine whether they could ever have been discovered by the investigations and efforts of the unassisted powers of the human mind. The only persons who could fairly try such an experiment were the Greeks and Romans, and other civilized nations, in ancient times, to whom the light of revelation was not imparted. And what was the result of all their researches on this most important of all subjects? What were the *vertical* effects of all the fine-spun theories and subtle speculations which originated in the schools of ancient philosophy, under the tuition of Plato and Socrates, of Aristotle and Zeno? The result is recorded in the annals of history, and in the writings of the apostles. "They became vain in their imaginations, and their foolish hearts were darkened. They were filled with all unrighteousness, fornication, wickedness, covetousness, maliciousness, envy, murder, deceit, malignity; they were backbiters, haters of God, despitful, proud, inventors of evil things, disobedient to parents, without natural affection, implacable, and unmerciful." Their general conduct was characterized by pride, lasciviousness, and revenge; they indulged in the commission of unnatural crimes; they were actuated by restless ambition, and they gloried in covering the earth with devastation and carnage.

It is true, indeed, that some of the sects of philosophers propounded several maxims and moral precepts, the propriety of which cannot be questioned; but none of them could agree respecting either the foundation of virtue, or the ultimate object toward which it should be directed, or that in which the chief happiness of man consists; and hence it happened, that the precepts delivered by the teachers of philosophy had little influence on their own conduct, and

far less on that of the unthinking multitude. Where do we find, in any of the philosophical schools of Greece and Rome, a recommendation of such precepts as these, "Love your enemies; do good to them who hate you; and pray for them who despitefully use you and persecute you?" In opposition to such divine injunctions, we can trace, in the maxims and conduct of the ancient sages, a principle of pride insinuating itself into the train of their most virtuous actions. It has been reckoned by some a wise and a witty answer which one of the philosophers returned to his friend, who had advised him to revenge an injury he had suffered; "What, (says he) if an ass kicks me, must I needs kick him again?" Some may be disposed to consider such a reply as indicating a manly spirit, and true greatness of soul; but it carries in it a proud and supercilious contempt of human nature, and a haughtiness of mind, which are altogether inconsistent with the mild and benevolent precepts of Him, who, in the midst of his severest sufferings from men, exclaimed, "Father, forgive them, for they know not what they do."

It appears somewhat preposterous to waste our time, and the energies of our minds, in labouring metaphysical disquisitions, to ascertain the foundations of virtue, and the motives from which it is to be pursued; whether it consists in utility, in the *fitness of things*, or in the regulations of states and political associations, and whether it is to be prosecuted from a principle of self-love or of benevolence, when every useful question that can be started on this subject may be immediately solved by a direct application to the revelations of heaven, and an infallible rule derived for the direction of our conduct in all the circumstances and relations in which we may be placed. Even although the moral philosopher were to reject the Bible, as a revelation from God, it would form no reason why its announcements should be altogether overlooked or rejected. As an impartial investigator of the history of man, of the moral constitution of the human mind, and of the circumstances of our present condition, he is bound to take into view

every fact and every circumstance which may have a bearing on the important question which he undertakes to decide. Now, it is a *fact*, that such a book as the Bible actually exists—that, amidst the wreck of thousands of volumes which the stream of time has carried into oblivion, it has survived for several thousands of years—that its announcements have directed the opinions and the conduct of myriads of mankind—that many of the most illustrious characters that have adorned our race have submitted to its dictates, and governed their tempers and their actions by its moral precepts—that those who have been governed by its maxims have been distinguished by uprightness of conduct, and been most earnest and successful in promoting the happiness of mankind—that this book declares, that a moral revulsion has taken place in the constitution of man since he was placed upon this globe—and that the whole train of its moral precepts proceeds on the ground of his being considered as a depraved intelligence. These are facts which even the infidel philosopher must admit; and, instead of throwing them into the shade, or keeping them entirely out of view, he is bound, as an unbiassed inquirer, to take them all into account in his researches into the moral economy of the human race. In particular, he is bound to inquire into the probability of the alleged fact of the depravity of man, and to consider, whether the general train of human actions, the leading facts of history in reference to all ages and nations, and the destructive effects of several operations in the system of nature, have not a tendency to corroborate this important point. For the fact, that man is a fallen intelligence, must materially modify every system of ethics that takes it into account. Should this fact be entirely overlooked, and yet ultimately be found to rest on a solid foundation, then, all the speculations and theories of those moralists who profess to be guided solely by the dictates of unassisted reason, may prove to be nothing more than the reveries of a vain imagination, and to be built on "the tenuous fabric of a vision."

## CHAPTER I.

### ON THE MORAL RELATIONS OF INTELLIGENT BEINGS TO THEIR CREATOR.

#### SECTION I.

##### ON THE PRIMARY OR MOST GENERAL IDEA OF MORALITY.

I CONCEIVE, that the first or most general idea of morality is, ORDER,—or, that harmonious disposition and arrangement of intelligent beings, which is founded on the nature of things, and which tends to produce the greatest sum of happiness.

*Physical Order*, or the order of the material universe, is that by which every part is made to harmonize to the other part, and all individually to the whole collectively. Thus, the adaptation of light to the eye, and of the eye to light; the adaptation of the structure of the ear and of the lungs to the constitution of the atmosphere, and its various undulations; the adaptation of the waters, the vegetable productions of the field, the minerals in the bowels of the earth, the colours produced by the solar rays, and all the other parts and agencies of external nature, to the wants and the happiness of sentient beings; the adaptation of day and night to the labour and rest appointed for man; and the regularity of the motions of the planetary bodies in their circuits round the sun—constitute the *physical* order, or harmony of the visible world; and it is this which constitutes its principal beauty, and which evinces the wisdom of its Almighty Author.

*Moral Order* is the harmony of intelligent beings in respect to one another, and to their Creator, and is founded upon those relations in which they respectively stand to each other.—Thus, reverence, adoration, and gratitude, from creatures, correspond or harmonize with the idea of a self-existent, omnipotent, and benevolent Being, on whom they depend, and from whom they derive every enjoyment,—and love, and good will, and a desire to promote each other's happiness, harmonize with the idea of intelligences of the same species mingling together in social intercourse. For, it will at once be admitted, that affections directly opposite to these, and universally prevalent, would tend to destroy the moral harmony of the intelligent universe, and to introduce anarchy and confusion, and consequently misery, among all the rational inhabitants of the material world.

The following brief illustration, by way of contrast, may, perhaps, have a tendency more particularly to impress the mind with the idea

of order intended to be conveyed in the above stated definitions.

Suppose the principle which unites the planetary globes in one harmonious system, to be dissolved, and the planets to run lawlessly through the sky—suppose the planet Jupiter to forsake his orbit, and in his course to the distant regions of space, to impinge against the planet Saturn, and to convulse the solid crust of that globe from its surface to its centre, to disarrange the order of its satellites, to shatter its rings into pieces, and to carry the fragments of them along with him in his lawless career,—suppose the sun to attract his nearest planets to his surface with a force that would shake them to their centres, and dissolve their present constitution,—suppose the moon to fly from her orbit, and rush towards the planet Venus,—the earth to be divested of its atmosphere, the foundations of its mountains to be overturned, and to be hurled into the plains, and into the ocean; its seas and rivers to forsake their ancient channels, and to overflow the land, and its human inhabitants swept promiscuously along with the inferior animals into dens and caves, and crevices of the earth, and into the bottom of the ocean:—in such a scene, we should have presented to our view a specimen of physical confusion and disorder; and it would form an impressive emblem of the state of rational beings, whose moral order is completely subverted.

Again, suppose the rational inhabitants of our globe to be universally set against each other, in order to accomplish their misery and destruction—suppose the child rising in opposition to his parents, the wife plotting the destruction of her husband, the brother insnaring his sister, and decoying her to ruin,—teachers of all descriptions inculcating the arts of deception, of revenge, and of destruction, and representing every principle and fact as contrary to what it really is—falsehoods of every description industriously forged and circulated as facts through every rank of society—rulers setting themselves in opposition to the populace, and plotting their destruction, while they are at the same time actuated by a principle of pride, of envy, and malice against each other—the populace setting themselves in opposition to their rulers, exterminating them from the earth, subverting every principle of law and order, gratifying, without control, every principle of revenge, avarice, lasciviousness and sensual indulgence, and enjoying

diabolical satisfaction in contemplating the scenes of misery they have created:—in short, every one beholding in his neighbour the malevolence of a fiend armed with instruments of destruction, and devising schemes to secure his misery and ruin. Suppose the lower animals, impelled by revenge, to rise up in indignation against man, and to swell the horrors of this general anarchy—suppose the superior orders of intelligences to mingle in this scene of confusion, to exert their high physical and intellectual powers in adding fuel to these malevolent principles and operations, and in attempting to drag other intelligences of a still higher order from their seats of bliss—suppose all these intelligences actuated by an implacable hatred of their Creator, combined to deface the beauties of the material creation, and then to engage in a war of universal extermination throughout the whole intelligent system in every region of the universe: such a state of things, if it could exist in the universe, would form a perfect contrast to *moral order*; it would present a scene in which existence could not be desirable to any intelligent mind, and in which happiness could not possibly be enjoyed by any rational being, but by Him who is eternally happy independently of his creatures. Moral order, then, is completely opposed to such a state of things as has now been represented; it consists in every being holding its proper station in the universe, acting according to the nature of that station, and using its powers and faculties for the purposes for which they were originally intended; and the grand object intended to be accomplished by this order, is, the happiness of the whole,—without which misery would reign uncontrolled throughout all the ranks of intelligent existence.

This state of the moral world is most frequently designated in scripture by the term *holiness*. Of the ideas included under this term, and several of its kindred epithets, very vague and imperfect conceptions are frequently entertained. Its leading or generic idea, from what has been now stated, will evidently appear to be, *a conformity to order*, founded on the relations of intelligent beings to each other; or, in other words, it consists in a complete conformity to the law of God, (which is founded on those relations) including both the *action* and the *principle* from which it flows. In reference to created beings, holiness may, therefore, be defined to be *a conformity to the moral order of the universe*,—and, in relation to the Creator, it is *that perfection of his nature, which leads him to promote the moral order and happiness of intelligent beings, and to counteract every thing which stands in opposition to this object*.

That the leading ideas and definitions now stated are correct, will, perhaps, more distinctly appear in the course of the following discussions and illustrations; but should any one be disposed

to call in question the statements now given in reference to the primary idea of morality, his difference of opinion on this point will not materially affect the leading train of sentiment prosecuted in the further elucidation of this subject.

## SECTION II.

### OF THE FUNDAMENTAL PRINCIPLES OF MORALITY.

The leading idea of morality or holiness, as now stated, resolves itself into the two following principles—*love to God the Creator, and love to fellow intelligences*. These are the two grand springs on which the whole moral machine of the universe depends. All the diversified actions by which happiness is diffused among intelligent agents, are only so many ramifications of these two simple and sublime principles, which connect all holy beings throughout the wide empire of God, in one harmonious union. This we are not left to infer merely from the nature of things, but have the authority of the supreme Legislator, as our warrant for placing these principles as the foundation of all moral virtue among every class of moral agents. For thus saith our Saviour, "THOU SHALT LOVE THE LORD THY GOD WITH ALL THY HEART, AND WITH ALL THY MIND, AND WITH ALL THY STRENGTH. *This is the first and great commandment. The second is like unto it: THOU SHALT LOVE THY NEIGHBOUR AS THYSELF. On these two principles hang all the law and the prophets.*"

These principles, now that they are communicated, and sanctioned by divine authority, appear quite accordant to the dictates of enlightened reason, and calculated to promote the happiness of the intelligent creation; yet we never find that the moral systems of pagan philosophers, in any country, were built on this foundation, or that they assumed them as indispensable axioms to guide them in their speculations on the subject of ethics.

In elucidating this topic, I shall endeavour to show the reasonableness and the utility of these principles of moral action, from a consideration of the nature of God, and the relations in which intelligent beings stand to him as the source of their existence and felicity—from the nature of subordinate intelligences, and the relations in which they stand to one another—from the misery which must inevitably follow, where such principles are violated or reversed—from the happiness that would necessarily flow from their full operation—and, lastly, that they apply to the circumstances of all created intelligences wherever existing, throughout the boundless universe—I have used the plural term *principles*, to ex-

press the foundation of moral action, because our Saviour has arranged them under two distinct heads, in the passage just now quoted; but strictly speaking, there is but *one* principle, namely, *Love*, which divides itself, as it were, into two great streams, one directing its course towards the supreme Source of all felicity, and the other towards all the subordinate intelligences He has created.

*First Principle—Love to God.*

Love, considered in reference to the Supreme Being, may be viewed as dividing itself into a variety of streams or kindred emotions, all flowing from one source. The most prominent of these emotions are the following—*Admiration*, which consists in a delightful emotion, arising from a contemplation of the wonderful works of God, and of the wisdom and goodness which they unfold—*Reverence*, which is nearly allied to admiration, is a solemn emotion, mingled with awe and delight, excited in the mind, when it contemplates the perfections, and the grand operations of the Eternal Mind—*Gratitude*, which consists in affection to the Supreme Being, on account of the various benefits he has conferred upon us—*Humility*, which consists in a just sense of our own character and condition, especially when we compare ourselves with the purity and perfection of the divine character. To these emotions may be added *Complacency* and delight in the character and operations of God—*Adoration* of his excellencies, and an unlimited *Dependence* upon him in reference to our present concerns, and to our future destination. I have stated these different modifications of the first principle of morality, because, in the following illustrations, they may all occasionally be taken into account, when an allusion is made to the affections, which the character and operations of the divine Being have a tendency to excite.

Love is that noble affection which is excited by amiable objects; and therefore, in order to its being rational, permanent, and delightful, it must be founded on the perception of certain amiable qualities or attributes connected with its object. In order to demonstrate the reasonableness of this affection in reference to God, it is only requisite to consider his character and perfections, and the relation in which he stands to us as the Author of our existence and enjoyments. But, as a comprehensive view of this subject would require volumes for its illustration, I shall confine myself to the illustration of only two or three lineaments of the divine character.

SECTION III.

ON THE OMNIPOTENCE OF GOD.

We naturally venerate and admire a character in which physical energy is combined with high

intellectual powers, when these powers are uniformly exerted in the counteraction of vice and misery, and in the promotion of happiness. On this ground, the Omnipotence of God is calculated to affect the mind with that particular modification of love, which is designated by the term *Reverence*. Were it possible that any human being could construct a machine, by means of which, in combination with his own physical powers, he could transport himself and his treasures from one region of the globe to another, at the rate of 200 miles in an hour, and were he, at the same time, to devote his treasures, and his moral and intellectual energies to the improvement and melioration of the various tribes of mankind in every clime through which he passed, such an object could not fail of exciting in our minds a sentiment of admiration and reverence. Were one of the highest orders of created intelligences to descend from his celestial mansion, and to display himself to our view in all the bright radiance of his native heaven—were he to take his station over the regions of Thibet or Hindostan, and, after having excited the attention of a wondering populace, were he to detach the huge masses of the Himalaya mountains from their foundations, and toss them into the depths of the Indian Ocean, and, in the course of a few hours, transform the barren wastes of that dreary region into a scene of beauty and luxuriant vegetation, and cause splendid cities to arise, where formerly nothing was presented to the view but a bleak and frightful wilderness—at such a display of physical power, combined with benevolent design, we could not withhold a feeling of awe, and a sentiment of reverence, almost approaching to religious adoration.

If, then, the contemplation of physical and mental energies, with which even created beings may possibly be invested, would excite our admiration and reverence, what powerful emotions of this description must the energies of the Uncreated Mind be calculated to produce, when they are contemplated by the eye of enlightened reason, and in the light of divine revelation? When this huge globe on which we dwell existed in the state of a shapeless and unformed mass; when land, and water, and air, were blended in wild confusion, and chaos and darkness extended their dominion over all its gloomy regions, at His command “light sprung out of darkness, and order out of confusion;” the mountains reared their projecting summits, the valleys were depressed, the caverns of the ocean were hollowed out, and the waters retired to the places which He had appointed for them. The fields were clothed with luxuriant verdure; Eden appeared in all its beauty; the inferior tribes of animated existence took possession of the air, the waters, and the earth, and man was formed in the image of his Maker, to complete this

wondrous scene. At this period, too, the earth received such a powerful impulse from the hand of its Creator, as has carried it along through the voids of space, with all its furniture and inhabitants, in the most rapid career, for six thousand years; having already moved through a space of 3,480,000,000,000 miles, and will still continue its unremitting course for thousands of years to come, till the "mystery of Providence be finished."

Would we be struck with admiration and astonishment, at beholding a superior created intelligence tossing a mountain into the sea? What strong emotions of reverence and awe, then, ought to pervade our minds, when we behold the Almighty every moment producing effects infinitely more powerful and astonishing! What would be our astonishment, were we to behold, from a distance, a globe as large as the earth tossed from the hand of Omnipotence, and flying at the rate of a thousand miles every minute! Yet this is nothing more than what is every day produced by the unceasing energies of that Power which first called us into existence. That impulse which was first given to the earth at its creation is still continued, by which it is carried round every day from west to east, along with its vast population, and at the same time impelled forward through the regions of space at the rate of sixty-eight thousand miles in an hour. Nor is this among the most wonderful effects of divine power: it is only one comparatively small specimen of that omnipotent energy which resides in the Eternal Mind. When we lift our eyes towards the sky, we behold bodies a thousand times larger than this world of ours, impelled with similar velocities through the mighty expanse of the universe. We behold the planetary globes wheeling their rapid courses around the sun, with unremitting velocity—the comets returning from their long excursions in the distant regions of space, and flying towards the centre of our system with a velocity of hundreds of thousands of miles an hour—the sun himself impelled toward some distant region of space, and carrying along with him all his attendant planets—and, in a word, we have the strongest reason to conclude, that all the vast systems of the universe, which are more numerous than language can express, are in rapid and incessant motion around the throne of the Eternal, carrying forward the grand designs of infinite wisdom which they are destined to accomplish.\*

It must, however, be admitted, that the manifestation of power, or great physical energy, abstractly considered, is not of itself calculated to produce that emotion of reverence which flows from love, unless the being in whom it resides exerts it for the purposes of benevolence. A superior being, endowed with great physical

and intellectual energies, which were exerted solely for the purpose of destruction, could inspire no feelings but those of dread and alarm; and were it possible to conceive an omnipotent being divested of the attribute of benevolence, or possessed of a capricious character, he would form the most terrible object which the human mind could contemplate. But the attribute of infinite power, when conjoined with infinite wisdom and goodness, conveys an idea the most glorious and transporting. Every display of divine power to which I have now alluded, has the communication of happiness for its object. The motion of the earth around its axis every twenty-four hours, is intended to distribute light and darkness, in regular proportions, to all the inhabitants of the earth, and to correspond to the labour and rest appointed for man. It produces a variety which is highly gratifying to the rational mind; for, while our fellow-men on the opposite side of the globe are enjoying the splendours of the noonday sun, the shades of night, which at that time envelope our hemisphere, are the means of disclosing to our view the magnificent glories of the starry frame. Were this motion to cease, this world and all its inhabitants would be thrown into a state of confusion and misery. While the inhabitants of one hemisphere enjoyed the splendours of perpetual day, the glories of the nocturnal heavens would be for ever veiled from their view, and the inhabitants of the other hemisphere would be enveloped in the shades of eternal night. While the one class was suffering under the scorching effects of excessive heat, the other would be frozen to death amidst the rigours of insufferable cold—vegetable nature, in both cases, would languish, and the animal tribes would be gradually extinguished.

The same benevolent intention may be perceived in that exertion of power by which the earth is carried forward in its annual course around the sun. From this motion we derive all the pleasures we enjoy from the vicissitude of the seasons; without which the variety of nature that appears in the beauties of spring, the luxuriance of summer, the fruits of autumn, and the repose of winter, would be completely destroyed. And, it is worthy of notice, that all this variety is enjoyed every moment by some one tribe or other of the human family; for while it is summer in one region, it is winter in another; and while one class of our fellow-men is contemplating the opening beauties of spring, another is gathering in the fruits of harvest. The same benevolent designs, we have every reason to believe, are displayed in those more magnificent exertions of divine power which appear among all the rolling worlds on high; for, in so far as our observations extend, all the arrangements of the planetary globes appear calculated to promote the happiness of sentient and intellectual beings.

\* See a more comprehensive illustration of this subject in "The Christian Philosopher," pp. 8—29.

While, therefore, we contemplate the operations of divine power, either in the earth or in the heavens, we perceive every thing which is calculated to inspire us with love, admiration, and reverence. When we lie down on our pillows in the evening, how pleasing it is to reflect, that the power of our Almighty Father will be exerted in carrying us round in safety several thousands of miles, during our repose in sleep, in order that our eyes may be again cheered with the morning light? When, amid the gloom and storms of winter, we look forward to the reviving scenes of spring, we know that we must be carried forward more than a hundred millions of miles, before we can enjoy the pleasures of that delightful season; and when spring arrives, we must be carried through the voids of space a hundred millions of miles farther, before we can reap the fruits of summer and harvest. How delightful, then, is the thought, that the omnipotent energy of our heavenly Father is incessantly exerted in producing such a wonderful effect, accompanied by such a variety of beneficent changes, all contributing to our enjoyment!\*

What is the reason, then, why we feel so little admiration and reverence at the beneficent operations of divine power? If we should be struck with veneration and wonder at beholding a superior created intelligence tossing a range of mountains into the sea, why do we behold, with so much apathy, effects ten thousand times more energetic and astonishing? One general reason, among others, undoubtedly is, that the moral constitution of man has suffered a melancholy derangement; in consequence of which, the train of his thoughts and affections has been turned out of its original channel. The Scriptures are clear and explicit on this point; they declare, in the most positive terms, that "the carnal mind is *enmity against God*," and that, in consequence of this depraved principle, the wicked "walk in the vanity of their minds, being alienated from the life of God. They say to the Almighty, Depart from us, for we desire not the knowledge of thy ways. God is not in all their thoughts, and through pride of their countenances they will not call upon God."—Another reason is, that the almighty Agent who produces so stupendous effects remains invisible to mortal eyes. Were a celestial intelligence to appear in a splendid and definite form, and to produce such effects as I

have supposed, the connexion between the agent and the effects produced, would forcibly strike the senses and the imagination. But he who sits on the throne of the universe, and conducts all its movements, is a being "who dwells in light unapproachable, whom no man hath seen, or can see." He can be contemplated only through the sensible manifestations he gives of his perfections; and, were the train of our thoughts properly directed, we would perceive him operating in every object and in every movement. We would hear his voice in the wind and the thunder, in the earthquake, the storm, and the tempest; we would see him in the beauties and sublimities of sublunary nature, in the splendours of the sun, and the glories of the nocturnal sky; and, in whatever situation we might be placed, we would feel ourselves surrounded with the omnipotent energies of an ever-present Deity.

The contemplation of God as an omnipotent being, is calculated to inspire the mind with love and confidence in the prospect of futurity. The promises addressed to us by a wise and benevolent being can excite in us trust and dependence, only in so far as we are convinced of his ability to secure their fulfilment. If almighty power were not an attribute of the Eternal Mind, or were we unable to trace its operations in visible existing facts, then all the promises and delineations of revelation, in reference to unseen and eternal objects, might prove to be nothing more than imaginary scenes, that could never be realized. But the good man, who perceives omnipotent energy in incessant operation throughout all the scenes of the universe which surround him, feels the most perfect security in looking forward to the scene of his future destination, and to those changes and revolutions which shall succeed the period of his present existence. He knows that, in a few years at most, that immortal principle which now animates his frame, will take its flight from its earthly mansion to a world unknown. To what regions it will direct its course; what scenes and prospects will be unfolded to its view; what intercourse it may have with the spirits of departed men, or with other intelligences; in what state it shall pass its existence till the consummation of the present plan of Providence—whether it shall remain as a naked spirit entirely disconnected with the visible universe, or be clothed with some ethereal vehicle, to enable it to hold a correspondence with other regions of the material creation—he is at present unable to determine. He knows that his body, too, shall disappear from the living world, and be reduced to corruption and ashes. In what manner the essential particles of this body shall be preserved distinct from those of all other human bodies, after they have been tossed about by the winds, and blended with the other elements of nature; by what means they shall be reunited into a more glorious form; and how

\* In this, and other places of this work, the truth of the annual and diurnal motions of the earth is taken for granted, because I conceive it is susceptible of the clearest demonstration—(See "Christian Philosopher," pp. 23, 83, 147, 149.) But, should the truth of this position be called in question or denied, it will not materially affect the propriety of such moral reflections as are here stated; for, in this case, a similar, or even a much greater display of omnipotence must be admitted in reference to the motions of the heavenly bodies, in bringing about the succession of day and night, and the changes of the seasons.

the separate spirit shall be enabled to recognize its renovated and long-lost partner at the resurrection of the just—he can form no conception.

He knows, that the globe on which he now resides is doomed to be dissolved amidst devouring flames, when “the elements shall melt with fervent heat, and the earth, and the works that are therein, shall be burnt up”—that the ashes of all the myriads of the race of Adam shall issue from the caverns of the ocean, and from the charnel houses, in every region of the land—that they shall be moulded into new organical structures, united with their kindred spirits, and be convened in one grand assembly before God, the Judge of all. He knows, that “new heavens and a new earth” will be arranged for the residence of the “redeemed from among men;” but in what region of the universe this abode may be prepared, what scenes it will unfold, and by what means the innumerable company of the righteous shall be transported from amidst the ruins of this globe to that celestial habitation—he is at present at a loss to form even a conjecture. He knows, that after these solemn changes have been effected, ages numerous as the drops of the ocean will roll over him—that worlds numerous as the stars of heaven will still run their destined rounds—that other systems may undergo important changes and revolutions—that new systems of creation may be gradually emerging into existence, and that scenes of magnificence and glory, different from all that ever preceded them, may incessantly rise to view, throughout the lapse of unceasing duration. But, in the prospect of all these solemn and important events, he beholds—in that almighty energy which wheels our globe around from day to day, and impels it in its annual course, and which directs, at the same time, the movements of all the hosts of heaven—the exertion of a benevolent power, which is calculated to inspire him with love and confidence, and which is able to secure his happiness amidst the revolutions of worlds, and amidst all the scenes through which he may pass during an immortal existence. Under this impression, he can adopt the affectionate and triumphant language of the psalmist—“Whom have I in heaven but thee, and there is none upon earth that I desire beside thee! My heart and my flesh shall fail, but God is the strength of my heart, and my portion for ever.”

Thus it appears, that the omnipotence of God is one of those attributes of his nature which is particularly calculated to fill the mind with sentiments of love and confidence, admiration and reverence. And, if such emotions be at all excited in the mind, they must rise to the highest pitch of elevation to which we can carry them; for there is no other object or being that possesses the same perfection, or can claim the same degree of affection and love. If we love God at all, it must be “with all our heart, with all our

understanding, and with all our strength.” The considerations to which I have now adverted, have been too seldom taken into view in moral and religious discussions on this topic. The omnipotence of the Deity is seldom exhibited as a ground and an excitement of veneration and love, and yet it stands, as it were, on the forefront of the divine character, giving beauty and efficiency to all his other perfections: without which wisdom, benevolence, faithfulness, mercy, and patience, would degenerate into empty names, and form no solid foundation for the exercise of confidence and hope. And, therefore, it is the duty of every Christian to endeavour, by every proper means, to enlarge his conceptions of the operations of omnipotence, and to familiarize his mind to contemplations of the magnitude, motions, grandeur, and immensity of God’s works, in order that his love to God may be elevated and expanded, and his faith and hope strengthened and invigorated. To this attribute of Jehovah the inspired writers uniformly direct our views, as a source of joy and confidence. “Praise ye the Lord,—praise him, ye servants of the Lord; for I know that Jehovah is great, and that our Lord is above all gods. Whatever the Lord pleased, that did he, in heaven, and in earth, in the seas, and all deep places. Great is the Lord, and greatly to be praised; his greatness is unsearchable. I will speak of the glorious honour of thy majesty, and of thy wondrous works. I will speak of the might of thy terrible acts, and will declare thy greatness; to make known to the sons of men thy mighty operations, and the glorious majesty of thy kingdom. Happy is he who hath the God of Jacob for his help, whose hope is in the Lord his God, who made heaven and earth, the sea, and all that in them is, who keepeth truth for ever.”

#### SECTION IV.

##### OF THE WISDOM AND GOODNESS OF GOD.

Another feature in the divine character, which is calculated to excite our most ardent affection, is, the *Wisdom* and *Goodness* of God. These two attributes may be considered under one head, since they are always inseparable in their operation. *Goodness* proposes the end, namely, the happiness of the sensitive and intelligent creation; and *Wisdom* selects the most proper means for its accomplishment.

Wherever genius appears combined with benevolent intentions and beneficent operations, we cannot withhold a certain portion of affection and regard.

When we behold a man like *Howard*, devoting his wealth, his knowledge, his intellectua

and active powers, to alleviate the sorrows, and to promote the happiness of his fellow-men—when we behold him in retirement at his native mansion, a universal blessing to his neighbours around him, furnishing employment for the poor, erecting schools for the instruction of their children, watching over the morals of his neighbourhood, visiting the abodes of affliction, acting the part of a physician to their bodies, imparting spiritual instruction to their souls, promoting the knowledge and practice of religion, and extending his benevolent regards to persons of all religious persuasions—when we behold him leaving his native country and the friends of his youth, on a tour of benevolence over all Europe and the East; hazarding his health and his life in the service of humanity, diving into the depths of dungeons, plunging into the infected atmospheres of hospitals and jails, visiting the lonely and squalid prisoner, entering the wretched hovels of sorrow and affliction, administering consolation and relief, and surveying the dimensions of misery and distress among men of all nations, for the purpose of devising schemes for the relief of the distressed of suffering humanity, and for promoting the comforts of mankind—when such a character appears on the stage of life, there is no class of the human race, whose powers are not completely vitiated, but must feel towards it strong emotions of esteem and affectionate regard.

But what are all the wise and beneficent designs of a fellow-mortal, when compared with the numerous and diversified streams of benevolence which are incessantly flowing from the uncreated source of felicity! They are but as a drop to the ocean, or as an atom when compared with the immensity of the universe. On him all beings depend, from the archangel to the worm; from Him they derive their comforts; to Him they are indebted for all their powers and faculties; and on him their eternal felicity depends. Were we to prosecute this subject to any extent, it would lead us into a field on which volumes might be written, and yet the greater part of the displays of divine beneficence would remain unrecorded. I shall therefore confine myself to the selection of only a few instances of the wisdom and goodness of God.

Wherever we turn our eyes in the world around us, we behold innumerable instances of our Creator's beneficence. In order that the eye and the imagination may be gratified and charmed, he has spread over the surface of our terrestrial habitation an assemblage of the richest colours, which beautify and adorn the landscape of the earth, and present to our view a picturesque and diversified scenery, which is highly gratifying to the principle of novelty implanted in the human mind. On all sides we behold a rich variety of beauty and magnificence. Here, spread the wide plains and fertile fields, adorned

with fruits and verdure; there, the hills rise in gentle slopes, and the mountains rear their snowy tops to the clouds, distilling from their sides the brooks and rivers, which enliven and fertilise the plains through which they flow. Here, the lake stretches into a smooth expanse in the bosom of the mountains; there, the rivers meander through the forests and the flowery fields, diversifying the rural scene, and distributing health and fertility in their train. Here, we behold the rugged cliffs and the stately port of the forest; there, we are charmed with the verdure of the meadow, the enamel of flowers, the azure of the sky, and the gay colouring of the morning and evening clouds. In order that this scene of beauty and magnificence might be rendered visible, He formed the element of light, without which the expanse of the universe would be a boundless desert, and its beauties for ever veiled from our sight. It opens to our view the mountains, the hills, the vales, the woods, the lawns, the flocks and herds, the wonders of the mighty deep, and the radiant orbs of heaven. It paints a thousand different hues on the objects around us, and promotes a cheerful and extensive intercourse among all the inhabitants of the globe.

Again, in order to gratify the sense of *hearing*, He formed the atmosphere, and endowed it with an undulating quality, that it might waft to our ears the pleasures of sound, and all the charms of music. The murmuring of the brooks, the whispers of the gentle breeze, the soothing sound of the rivulet, the noise of the waterfall, the hum of bees, the buzz of insects, the chirping of birds, the soft notes of the nightingale, and the melody of thousands of the feathered songsters, which fill the groves with their warblings, produce a pleasant variety of delightful emotions;—the numerous modulations of the human voice, the articulate sounds peculiar to the human species, by which the interchanges of thought and affection are promoted, the soft notes of the piano forte, the solemn sounds of the organ—and even the roaring of the stormy ocean, the dashings of the mighty cataract, and the rolling thunders which elevate the soul to sentiments of sublimity and awe—are all productive of a mingled variety of pleasures; and demonstrate that the distribution of happiness is one grand end of the operations of our bountiful Creator.

To gratify the sense of *smelling*, he has perfumed the air with a variety of delicious odours, which are incessantly exhaled from a thousand plants and flowers. Countless millions of these odoriferous particles, which elude the penetrating power of the finest microscope to discover, are continually wafted about by the air, and floating around us, impervious to the sight, the hearing, and the touch, but calculated to convey pleasure to the soul, through the medium of the olfactory nerves, and to enable us to “banquet on the invisible dainties of nature.”

To gratify the sense of *feeling*, he has connected pleasure with the contact of almost every thing we have occasion to touch, and has rendered it subservient for warning us of whatever may be disagreeable or dangerous. Had a malevolent being constructed the body of man, and formed the arrangements of external nature, he might have rendered the contact of every object of touch as acutely painful as when we clasp a prickly shrub, or thrust our fingers against the point of a needle.

To gratify the sense of *taste*, and to nourish our bodies, he has furnished us with a rich variety of aliments, distributed not with a niggardly and a sparing hand, but with a luxuriant profusion, suited to the tastes of every sentient being, and to the circumstances of the inhabitants of every clime. He has not confined his bounty merely to the relief of our necessities, by confining us to the use of a few tasteless herbs and roots, but has covered the surface of the earth with an admirable profusion of plants, herbs, grains, and delicious fruits of a thousand different qualities and tastes, which contribute to the sensitive enjoyment and comfort of man. In almost every region of the earth, corn is to be found in the valleys surrounded by the snowy mountains of the North, as well as in the verdant plains of the Torrid Zone. In warm regions, cool and delicious fruits are provided for the refreshment of the inhabitants, and the trees are covered with luxuriant foliage to screen them from the intensity of the solar heat!\* Every season presents us with a variety of fruits peculiar to itself, distributed by the munificent hand of the "Giver of all good." The month of June presents us with cabbages, cauliflowers, and cherries; July, with gooseberries, raspberries, peaches, and apricots; August and September scatter before us, in luxuriant abundance, plums, figs, apples, pears, turnips, carrots, cresses, potatoes, and, above all, wheat, oats, rye, and barley, which constitute the "staff of bread" for the support of man and beast; and although we are indebted chiefly to the summer and autumn for these rich presents, yet, by the assistance of

\* The manner in which the Creator has contrived a supply for the thirst of man, in sultry places, is worthy of admiration.—He has placed amidst the burning sands of Africa, a plant, whose leaf, twisted round like a cruet, is always filled with a large glass full of fresh water; the gullet of this cruet is shut by the extremity of the leaf itself so as to prevent the water from evaporating. He has planted in some other districts of the same country, a great tree, called by the negroes *boa*, the trunk of which, of a prodigious bulk, is naturally hollowed like a cistern. In the rainy season, it receives its fill of water, which continues fresh and cool in the greatest heats, by means of the tufted foliage which crowns its summit. In some of the parched, rocky islands in the West Indies, there is found a tree called the *water Nanna*, so full of sap, that if you cut a single branch of it, as much water is immediately discharged as a man can drink at a draught, and it is perfectly pure and limpid. See Pierre's "*Studies of Nature*."

human art, we can preserve and enjoy the greater part during winter and spring. The soil which produces these dainties has never yet lost its fertility, though it has brought forth the harvests of six thousand years, but still repays our labour with its annual treasures;—and, were selfish man animated with the same liberal and generous views as his munificent Creator, every individual of the human family would be plentifully supplied with a share of these rich and delicious bounties of nature.

In fine, the happiness of man appears to be the object of the divine care, every returning season, every moment, by day and by night. By day, He cheers us with the enlivening beams of the sun, which unfolds to us the beauty and the verdure of the fields; and lest the constant efflux of his light and heat should enfeeble our bodies, and wither the tender herbs, he commands the clouds to interpose as so many magnificent screens, to ward off the intensity of the solar rays. When the earth is drained of its moisture, and parched with heat, he bids the clouds condense their watery treasures, and fly from other regions on the wings of the wind, to pour their waters upon the fields, not in overwhelming and destructive torrents, but in small drops and gentle showers, to refresh the thirsty soil, and revive the vegetable tribes. He has spread under our feet a carpet of lovely green richer than all the productions of the Persian loom, and has thrown around our habitation an azure canopy, which directs our view to the distant regions of infinite space.—By night, he draws a veil of darkness over the mountains and the plains, that we may be enabled to penetrate to the regions of distant worlds, and behold the moon walking in brightness, the aspects of the planetary globes, the long trains of comets, and the innumerable host of stars. At this season, too, all nature is still, that we may enjoy in quiet the refreshments of sleep, to invigorate our mental and corporeal powers. "As a mother stills every little noise, that her infant be not disturbed; as she draws the curtain around its bed, and shuts out the light from its tender eyes: so God draws the curtains of darkness around us, so he makes all things to be hushed and still, that his large family may sleep in peace."—In a word, if we look around us to the forests which cover the mountains, or if we look downwards to the quarries and mines in the bowels of the earth, we behold abundance of materials for constructing our habitations, for embellishing the abodes of civilized life, and for carrying forward improvements in the arts and sciences. And, if we consider the surrounding atmosphere, we shall find it to contain the principle of life, and the element of *fire*, by means of which our winter evenings are cheered and illuminated in the absence of the sun.—Contemplating all these benign agencies as flowing from the care and

benevolence of our Almighty Parent, the pious mind may adopt the beautiful language of the poet, though in a sense somewhat different from what he intended:

"For me kind Nature wakes her genial power,  
Buckles each herb, and spreads out every flower;  
Annual for me, the grape, the rose renew  
The juice nectareous, and the balmy dew;  
For me the mine a thousand treasures brings;  
For me health gushes from a thousand springs;  
Seas roll to waft me, suns to light me, rise;  
My footstool earth, my canopy the skies." *Pope.*

Viewing the various scenes and harmonies of nature, in relation to man, and to the gratification of his different senses, we may also say, in the language of Akenside, in his poem "On the Pleasures of Imagination," that

Not a breeze  
Flies o'er the meadow, not a cloud imbibes  
The setting sun's effulgence; not a strain  
From all the tenants of the warbling shade  
Ascends, but whence his bosom can partake  
Fresh pleasure and delight.—  
The rolling waves, the sun's unwearied course,  
The elements and seasons, all declare  
For what the Eternal Maker has ordain'd  
The powers of man: we feel within ourselves  
His energy divine: He tells the heart  
He meant, He made us to behold and love  
What He beholds and loves, the general orb  
Of life and being: to be great like Him,  
Beneficent and active."

Let us now consider, for a few moments, the wisdom which is displayed in the harmonious adjustment of the organs of sense to the scenes of external nature. All the scenes of beauty, grandeur, and benignity, which surround us, in the earth and heavens, would remain as one mighty blank, unproductive of enjoyment, unless our bodies were "fearfully and wonderfully" framed, and endowed with organs fitted for enabling us to hold a correspondence with the material world. Ten thousands of vessels, tubes, bones, muscles, ligaments, membranes, motions, contrivances, and adaptations, beyond the reach of the human understanding fully to investigate or to comprehend, must be arranged, and act in harmonious concert, before any one sense belonging to man can perceive and enjoy its objects.

Before the eye can behold a landscape, and be charmed with its beauties, it was requisite that three humours should be formed, of different sizes, different densities, and different refractive powers—three coats, or delicate membranes, with some parts opaque, and some transparent, some black, and some white, some of them formed of radial, and some with circular fibres, composed of threads finer than those of the spider's web. The *crystalline* humour required to be composed of two thousand very thin spherical lamina, or scales, lying one upon another, every one of these scales made up of one single fibre, or finest thread, wound in a most stupendous manner, this way, and that way, so as to run several courses, and to meet in as many centres. This curious and delicate piece of organization

required to be compressed into the size of a ball of only half an inch in diameter, and a socket composed of a number of small bones, to be hollowed out and exactly fitted for its reception. A bed of loose fat for this ball to rest upon, a lid or curtain to secure it from danger, a variety of muscles to enable it to move upwards and downwards, to the right and to the left, and a numerous assemblage of minute veins, arteries, nerves, lymphatics, glands, and other delicate pieces of animal machinery, of which we have no distinct conception, were still requisite to complete this admirable organ. Even in this state it would be of no use for the purpose of vision, unless it were connected with the brain by the optic nerve, through the medium of which the impressions of visible objects are conveyed to the soul. Still, in addition to all these contrivances, a wonderful machinery requires to be in action, and an admirable effect produced, before a landscape can be contemplated. Ten thousand millions of rays, compounded of a thousand different shades of colour, must fly off in every direction from the objects which compose the surrounding scene, and be compressed into the space of one-eighth of an inch, in order to enter the eye, and must paint every object in its true colour, form, and proportion, on a space not exceeding half an inch in diameter. Were any one of the parts which compose this complicated machine either wanting or deranged; were it changed into a different form, or placed in a different position; were even a single muscle to lose its capacity of acting, we might be for ever deprived of all the enchanting prospects of the earth and heavens, and enveloped in the darkness of eternal night. Such is the skill and intelligence requisite for accomplishing, even in a single organ, the purposes of divine benevolence.

Again, before we could enjoy the harmony of sounds, the charms of music, and the pleasures of conversation, an instrument no less wonderful than the eye required to be constructed. In the ear, which is the organ of hearing, it was requisite, that there should be an outward porch for collecting the vibrations of the air, constructed, not of fleshy substances, which might fall down upon the orifice, or absorb the sounds, nor of solid bones, which would occasion pain and inconvenience when we repose ourselves—but composed of a cartilaginous substance, covered with a smooth membrane, endowed with elasticity, and bent into a variety of circular folds, or hollows, for the reflection of sound. It was farther requisite, that there should be a tube, or passage, composed partly of cartilage, and partly of bone, lined with a skin or membrane, and moistened with a glutinous matter, to form a communication with the internal machinery of this organ, where the principal wonders of hearing are performed. This machinery consists, first, of the *tympanum*,

or drum of the ear, which consists of a dry, thin, and round membrane, stretched upon a bony ring, so as actually to resemble the instrument we call a drum. Under this membrane is a small nerve, or string, stretched tight, for the purpose of stretching or relaxing the drum, and increasing or diminishing its vibrations, so as to render it capable of reflecting every possible tone. Behind it is a cavity, hewn out of the temporal bone, the hardest one in the body, in which there seems to be an echo, by which the sound is reflected with the utmost precision. This cavity contains four very small, but remarkable bones, denominated the *hammer*, the *anvil*, the *orbicular bone*, and the *stirrup*, all connected together, and necessary for contributing to the extension and vibration of the tympanum. In this cavity are also formed various windings or cavities filled with air; and, in order that the air may be renewed, there is an opening which communicates with the back part of the mouth, called the Eustachian tube.

The next apparatus belonging to this curious machine, is the *labyrinth*, which is composed of three parts, the *vestibule* or porch, *three semi-circular canals*, and the *cochlea*. This last is a canal, which takes a spiral course, like the shell of a snail, and is divided by a very thin lamina, or septum of cords, which keeps decreasing from the base to the top. The air acting on either side of these diminutive cords, produces a motion, nearly in the same manner as the sound of one musical instrument excites a tremulous motion in the cords of another. All these tubes, and winding canals, may be considered as so many sounding galleries, for augmenting the smallest tremours, and conveying their impressions to the auditory nerves, which conduct them to the brain. Besides the several parts now mentioned, a number of arteries, veins, lymphatics, glands, and a variety of other contrivances, which the human mind can neither trace nor comprehend, are connected with the mechanism of this admirable organ.

All this curious and complicated apparatus, however, would have been of no avail for the purpose of hearing, had not the atmosphere been formed, and its particles endowed with a tremulous motion. But, this medium being prepared, a sounding body communicates an undulatory motion to the air, as a stone thrown into a pond produces circular waves in the water; the air, thus put in motion, shakes the drum of the ear; the tremours, thus excited, produce vibrations in the air within the drum; this air shakes the handle of the hammer; the hammer strikes the anvil, with which it is articulated; the anvil transmits the motion to the stirrup, to which its longer leg is fastened; the stirrup transmits the motion it has received to the nerves; and the nerves, vibrating like the strings of a violin,

or lyre, and the motion being still further augmented in the *labyrinth*,—the soul, in a manner altogether incomprehensible to us, receives an impression proportioned to the weakness or intensity of the vibration produced by the sounding body. Such is the exquisite and complicated machinery which required to be constructed, and preserved in action every moment, before we could enjoy the benefits of sound, and the pleasures of articulate conversation.

Again, before we could enjoy the pleasures of feeling, an extensive system of organization required to be arranged. A system of nerves, originating in the brain and spinal marrow, and distributed, in numberless minute ramifications, through the heart, lungs, bowels, blood-vessels, hands, feet, and every other part of the body, was requisite to be interwoven through the whole constitution of the animal frame, before this sense, which is the foundation of all the other sensations, and the source of so many pleasures, could be produced. Wherever there are nerves, there are also sensations; and wherever any particular part of the body requires to exert a peculiar feeling, there the nerves are arranged and distributed in a peculiar manner, to produce the intended effect. And how nicely is every thing arranged and attempered, in this respect, to contribute to our comfort! If the points of the fingers require to be endowed with a more delicate sensation than several other parts, they are furnished with a corresponding number of nervous ramifications; if the heel require to be more callous, the nerves are more sparingly distributed. If feelings were equally distributed over the whole body, and as acutely sensible as in the membranes of the eye, our very clothes would become galling and insupportable, and we should be exposed to continual pain; and if every part were as insensible as the callus of the heel, the body would be benumbed, the pleasures we derive from this sense would be destroyed, and the other organs of sensation could not perform their functions in the manner in which they now operate. So that in this, as well as in all the other sensitive organs, infinite wisdom is admirably displayed in executing the designs of benevolence.

In order that we might derive enjoyment from the various aliments and delicious fruits which the earth produces, a peculiar organization, different from all the other senses, was requisite to be devised. Before we could relish the peculiar flavour of the pear, the apple, the peach, the plumb, or the grape, the *tongue*, the principal organ of *taste*, required to be formed, and its surface covered with an infinite number of nervous *papillæ*, curiously divaricated over its surface, to receive and convey to the soul the impressions of every flavour. These nerves required to be guarded with a firm and proper

tegument or covering, to defend them from danger, and enable them to perform their functions so long as life continues; and at the same time, to be perforated in such a manner, with a multitude of pores, in the papillary eminences, as to give a free admission to every variety of taste. It was likewise necessary, that these papillary nerves should be distributed in the greatest number, in those parts of the organ to which the objects of taste are most frequently applied; and hence we find, that they are more numerous on the upper than on the lower parts of the tongue; and, therefore, when we apply highly-flavoured substances to the under part, we are not so sensible of the taste, till we remove them to the upper surface. A variety of veins, arteries, glands, tendons, and other parts with which we are unacquainted, are also connected with this useful organ. When we consider how frequently these delicate organs are used, during a length of years, it is matter of admiration how well they wear. While our clothes wear out in the course of a year or two, while the hairs of our heads turn gray, and are nipped asunder at the roots, and while age shrivels the most beautiful skin, these delicate nervous papillæ last longer than instruments of iron or steel; for the sense of taste is generally the last that decays. For the bestowment of this sense, therefore, and the pleasures it conveys, we have abundant reason to admire and adore the wisdom and goodness of our Almighty Creator.

Finally, that we might be regaled with the scent of flowers, and the aromatic perfumes of spring and summer, and that none of the pleasures of nature might be lost, the organ of *smelling* was constructed to catch the invisible odoriferous effluvia which are continually wafted through the air. For this purpose it was requisite that bones, nerves, muscles, arteries, veins, cartilages, and membranes, peculiarly adapted to produce this effect, should be arranged, and placed in a certain part of the body. As the bones of the head are too hard for this purpose, the nerves of smelling required to have a bone of a peculiar texture, of a spongy nature, full of little holes, like a sieve, through which they might transmit their slender threads or branches to the papillous membrane which lines the cavities of the bone and the top of the nostrils. The nostrils required to be cartilaginous and not fleshy, in order to be kept open, and to be furnished with appropriate muscles to dilate or contract them as the occasion might require. It was likewise requisite, that they should be wide at the bottom, to collect a large quantity of effluvia, and narrow at the top, where the olfactory nerves are condensed, that the effluvia might act with the greatest vigour, and convey the sensation to the brain. By means of these and numerous other contrivances, connected with this organ, we are enabled to distinguish the qualities of our

food, and to regale ourselves on those invisible effluvia which are incessantly flying off from the vegetable tribes, and wafted in every direction through the atmosphere.

Of all the senses with which we are furnished, the sense of smelling is that which we are apt to consider as of the least importance; and some have even been ready to imagine, that our enjoyments would scarcely have been diminished although its organs had never existed. But, it is presumptuous in man to hazard such an opinion in reference to any of the beneficent designs of the Creator. We know not what relation the minutest operations, within us or around us, may bear to the whole economy of nature, or what disastrous effects might be produced, were a single pin of the machinery of our bodies broken or destroyed. The exhalations which are, at this moment, rising from a putrid marsh in the centre of New Holland, and hovering in an invisible form, over that desolate region, may be forming those identical clouds which, the next month, shall water our fields and gardens, and draw forth from the flowers their aromatic perfumes. The sense of smelling may be essentially requisite to the perfection of several of the other senses; as we know that the sense of feeling is inseparably connected with the senses of seeing, hearing, and tasting. Let us consider, for a moment, some of the agencies which require to be exerted when this sense is exercised and gratified. Before we could derive pleasure from the fragrance of a flower, it was requisite that a system of the finest tubes, filaments, and membranes should be organized, endowed with powers of absorption and perspiration, furnished with hundreds of vessels for conveying the sap through all its parts, and perforated with thousands of pores to give passage to myriads of odoriferous particles, secreted from the internal juices. It was also requisite that the atmosphere should be formed, for the purpose of affording nourishment to the plant, and for conveying its odoriferous effluvia to the olfactory nerves. The rains, the dews, the principle of heat, the revolution of the seasons, the succession of day and night, the principle of evaporation, the agitation of the air by winds, and the solar light,—all combine their influence and their agencies in producing the grateful sensation we feel from the smell of a rose. So that the sense of smelling is not only connected with the agency of all the terrestrial elements around us, but bears a relation to the vast globe of the sun himself; for an energy exerted at the distance of ninety-five millions of miles, and a motion of 200,000 miles every second, in the particles of light, are necessary to its existence; and consequently, it forms one of the subordinate ends for which that luminary was created:—and, being related to the sun, it may bear a certain relation

to similar agencies which that central globe is producing among the inhabitants of surrounding worlds.

Thus it appears, that the various senses of man, as well as the external objects which contribute to their gratification, are the results of infinite wisdom and goodness, and calculated to promote the happiness of sensitive and intelligent beings.

But, before any one of these senses could perform its functions, it required to be united with a most wonderful system of organization. The heart required to be endowed with an immense degree of muscular power, and to be set in action in the centre of this complicated system—hundreds of arteries required to be bored, and ramified, and arranged, to convey the blood to its remotest extremities, and hundreds of veins to bring it back again to its reservoir—thousands of lacteal and lymphatic tubes to absorb nutriment from the food, and convey it to the circulating fluid—thousands of glands to secrete humours that are noxious or redundant from the mass of blood, and emunctories to throw them off from the system—hundreds of muscles for moving the different members of the body, and for conveying the whole corporeal frame from place to place—hundreds of fine cords infinitely ramified over the whole body, to convey sensation to all its parts; and thousands of millions of perforations to be made in the skin, through which the insensible perspiration might continually flow. To support this fine and delicate system of vessels, hundreds of bones of diversified forms, and different sizes, and connected together by various modes of articulation, required to be constructed and arranged, and nicely adapted to their peculiar functions; and hundreds of tendons and ligaments, to connect these bones with the muscles, and with every other part of the animal frame. This machine required to be preserved in constant action, whether we be sleeping or waking, sitting or standing, in motion or at rest. The heart required to give ninety-six thousand strokes every twenty-four hours, to send off streams of the vital fluid through hundreds of tubes, and to impel the whole mass of blood through every part of the body every four minutes. The lungs required to be in constant play, expanding and contracting their thousand vesicles, at least twenty times every minute, to imbibe the oxygen of the atmosphere, and to transmit its enlivening influence to the circulating fluids—the stomach to be dissolving the food, and preparing it for the nourishment of the body—the liver and kidneys to be drawing off their secretions—the lacteals to be extracting nutritious particles, to be conveyed, by the absorbent vessels, into the mass of blood—and the perspiration, which might otherwise clog the wheels of the whole machine, to be thrown off incessantly through millions of pores. All this

curious and delicate machinery, constructed of the most flabby substances, required to be put in motion, and to be preserved in action every moment, before we could contemplate the beauties of a landscape, be delighted with the sounds of music, or inhale the fragrance of a rose.

It is worthy of notice, that, in the construction and arrangement of these numerous and complicated parts and functions, there is not a single instance, that any physiologist can produce, in which pain is the object of the contrivance. Of all the thousands of adaptations which infinite Wisdom has contrived, there is not one but what has for its object the communication of pleasure to the sentient being in which it is found. If a number of small muscles are connected with the eye, it is for the purpose of rendering that organ susceptible of a quick and easy motion in every direction, to meet every exigence. If the arteries are furnished with numerous valves, opening only in one direction, it is intended to prevent the blood from returning by a wrong course, and endangering the whole structure of the animal machine. If a joint is formed to move only in one direction, as the joints of the fingers, it is intended to prevent those inconveniences which would inevitably have been felt, had it been capable of moving in every direction. If another kind of joint is constructed so as to move in every direction, it is intended to enable us to perform, with facility, those movements and operations which would otherwise have been either impossible, or have been attended with the greatest inconvenience and pain. There are certain parts connected with the human frame, whose precise use cannot be accurately determined, but this is owing to our limited knowledge of the various functions which are requisite to be performed in this complicated machine. In no instance whatever can it be shown, that the infliction of pain is the object of any one part or function of whose use we are uncertain;—and it is conformable to the dictates of the soundest reason to conclude, that, since every part, whose use we can ascertain, is adapted to communicate pleasure, every other part, throughout every branch of the animal system, is calculated to produce a similar effect.

It is true, indeed, that pain is frequently felt in the different members which compose our corporeal system; but this is not owing to its original construction, but to the derangement which its parts receive, either from internal disease or from external violence: and such consequences are the effects either of the folly of man, in exposing his body to danger, or in using its members for improper purposes,—or of the physical changes which have happened in the system of nature since man was created,—or of those depraved and immoral passions which so frequently agitate and convulse his corporeal frame.

Let us now endeavour, if we can, to sum up a few of the blessings which we enjoy from these wise arrangements of our beneficent Creator. In our bodies there are reckoned 245 bones, each of them having forty distinct scopes or intentions, and 448 muscles for the purpose of motion, each having at least ten several intentions. All these are ready every moment to perform their functions; and every breath we draw, whether we be in motion or at rest, asleep or awake, a hundred muscles at least are in constant action. In the act of breathing, we respire at least twenty times every minute; the heart exerts its muscular force in propelling the blood into the arteries sixty times every minute; the stomach and abdominal muscles are every moment in action, and the curious little bones of the ear are ever ready to convey sensations of the softest whisper to the brain. So that, without an hyperbole, or the least extravagance of expression, it may truly and literally be said, that we enjoy a *thousand blessings every minute*, and, consequently, sixty thousand every hour, and one million four hundred and forty thousand every day. For, if any one of these numerous functions were to stop, or to be interrupted, pain, and even death itself might be induced. Let us ask the man who is gasping for breath, under an incurable asthma, or him who is smarting under the pain of a toothache, or him who has wounded a nerve, an artery, or a vein, or him who has dislocated his shoulder-blade, if he would not consider it as a peculiar blessing to have the functions of nature restored to their original action? And if one member out of joint, or one function out of order, produces so much pain and uneasiness, how grateful ought we to feel for the thousands of blessings we enjoy every moment, while the wheels of the animal machine are moving on with smoothness and harmony! If we consider the number of years during which these blessings have been continued,—if we consider the mercies received in childhood, which have been long overlooked or forgotten,—if we count the many nights which we have passed in sound repose, and the many days we have enjoyed without bodily pain,—if we reflect on the numerous objects of sublimity and beauty with which our eyes have been delighted, the numerous sounds which have charmed our ears and cheered our hearts, and the numerous gratifications which our other senses have received; if we consider how often food has been provided and administered for the nourishment of our bodies, and from how many visible and invisible dangers we have been delivered—and, if we view all these countless blessings as proceeding every moment from Him, “whose hands have made and fashioned us,” and who “breathed into our nostrils the breath of life,” can we forbear to recognise our Almighty Benefactor as worthy of our supreme affection and our most lively gratitude?

“For me, when I forget the darling theme,—  
Be my tongue mute, my fancy paint no more,  
And, dead to joy, forget my heart to beat.”

Under an impression of the diversified agencies of Divine Wisdom which are incessantly contributing to our enjoyment, and of the vast profusion of our Creator's beneficence which we behold around us, and experience every passing hour, can we forbear exclaiming with the enraptured poet:—

“When all thy mercies, O my God!  
My rising soul surveys,  
Transported with the view, I'm lost  
In wonder, love, and praise.  
Through every period of my life  
Thy goodness I'll proclaim;  
And, after death, in distant worlds,  
Renew the glorious theme.  
Through all eternity to Thee  
A joyful song I'll raise;  
For, oh! eternity's too short  
To utter all thy praise.”

If, then, the construction of our bodies, and the terrestrial scene in which we are placed, present so many striking displays of wisdom and benevolence, what an astonishing and transporting scene of divine benignity would burst upon the view, were we permitted to explore those more extensive provinces of the empire of Omnipotence, where physical and moral evil have never shed their baleful influence to interrupt the happiness of intellectual natures! Could we soar beyond the regions of the planetary system; could we penetrate into that immensity of worlds and beings which are scattered in magnificent profusion through the boundless fields of ether; could we draw aside the veil which now conceals the grandeur and beauty of their physical economy and arrangements; could we behold their inhabitants arrayed in robes of beauty, with ecstatic joy beaming from their countenances, basking perpetually in the regions of bliss, united to one another by indissoluble bands of love and affection, without the least apprehension of evil, or of an interruption to their enjoyments; and looking forward with confidence to an interminable succession of delighted existence; could we retrace the history of their Creator's dispensations towards them since the first moment of their existence, and the peculiar displays of divine glory and benignity, that may occasionally be exhibited to their view,—it is more than probable, that all the displays of wisdom and benevolence which we now behold, numerous as they are, would be thrown completely into the shade, and that this world would appear only as a Lazar-house, when compared with the bright and transporting scenes of the celestial works. This we are infallibly led to conclude, in regard to a certain class of intelligences in the future state, by the express declarations of Scripture. For thus it is written, “Eye hath not seen, nor ear heard, neither have entered into the heart of man, the things which God hath

prepared for them that love him." And if renovated men shall experience such superior enjoyments in the eternal world, there can be no doubt that all those intelligences, in every region, who have retained their primitive integrity, are at this moment in the possession of similar transporting enjoyments. It must, therefore, have an additional tendency to elevate our affections to the Supreme Intelligence, when we view Him not only communicating happiness to the various tribes of beings which people our globe, but also distributing streams of felicity in boundless profusion, among the inhabitants of unnumbered worlds.

I shall now conclude my illustrations of this topic, by exhibiting a few instances of the wisdom and goodness of God as delineated in the Sacred Scriptures.

"The Lord is good to all, and his tender mercies are over all his works. He stretched forth the heavens, and laid the foundation of the earth, and formeth the spirit of man within him. He planted the ear, and formed the eye; and he breathed into our nostrils the breath of life. In his hand is the soul of every living thing, and the breath of all mankind. With him is wisdom and strength, and his understanding is infinite. He is wonderful in counsel, and excellent in working. He hath established the world by his wisdom, and stretched out the heavens by his understanding. O the depth of the riches both of the wisdom and the knowledge of God! how unsearchable are his operations, and his ways past finding out! He causeth the vapours to ascend from the ends of the earth; he bindeth up the waters in his thick clouds, and the cloud is not rent under them. He hath compassed the waters with bounds, until the day and night come to an end. He visiteth the earth and watereth it; he greatly enricbeth it with rivers; he prepareth corn for its inhabitants; he watereth the ridges thereof abundantly; he setteth the furrows thereof; he maketh it soft with showers; he blesseth the springing thereof; he crowneth the year with his goodness, and his paths drop fatness. The pastures are clothed with flocks; the valleys are covered over with corn, and the little hills are encircled with joy.\*

"He sendeth the springs into the valleys which run among the hills; they give drink to every beast of the field. Beside these springs the fowls of heaven have their habitation, which sing among the branches. He causeth the grass to grow for the cattle, and herb for the service of man; and wine that maketh glad the heart of man, and oil that maketh his face to shine, and bread that strengtheneth his heart. He planted the tall trees and the cedars of Lebanon, where

the birds make their nests, and the storks their dwellings. The high hills are a refuge for the wild goats, and the rocks for the conies. He appointed the moon for seasons, and the sun to enlighten the world; he makes darkness a curtain for the night, till the sun arise, when man goeth forth to his work and to his labour till the evening. How manifold are thy works, O Lord! In wisdom hast thou made them all; the earth is full of thy riches; so is the great and wide sea, wherein are things creeping innumerable, both small and great beasts. These all wait upon thee, that thou mayest give them their meat in due season. Thou givest them—they gather; thou openest thine hand—they are filled with good. Thou hidest thy face—they are troubled; thou sendest forth thy spirit—they are created; and thou renewest the face of the earth. The glory of the Lord shall endure for ever; Jehovah shall rejoice in all his works. He is Lord of heaven and earth; he giveth to all, life, and breath, and all things; he hath made of one blood all nations of men, to dwell on all the face of the earth; and hath determined the times before appointed, and the bounds of their habitation. For in him we live, and move, and have our being. I will sing unto Jehovah as long as I live; I will sing praises to my God, while I have my being; I will utter abundantly the memory of his great goodness, and speak of all his wondrous works."

The inspired writers rise to still higher strains when they celebrate the Divine Goodness in reference to our eternal salvation.

"Praise ye Jehovah, for Jehovah is good; he remembered us in our low estate; for his mercy endureth for ever. I will praise thee, O Lord, my God, with all my heart, and I will glorify thy name for evermore; for great is thy mercy toward me, and thou hast delivered my soul from the lowest hell. God so loved the world, that he gave his only-begotten Son, that whosoever believeth on him should not perish, but have everlasting life. He sent an angel from the celestial glory to announce his birth; and a multitude of the heavenly host to proclaim, Glory to God in the highest, peace on earth, and good will to men. He spared not his own Son, but delivered him up for us all—and shall he not with him also freely give us all things? Blessed be the God and Father of our Lord Jesus Christ, who hath blessed us with all spiritual blessings in heavenly things in Christ; in whom we have redemption through his blood, the forgiveness of sins, according to the riches of his grace.—Bless the Lord, O my soul, and all that is within me bless his holy name; who forgiveth all thine iniquities, who healeth all thy diseases; who redeemeth thy life from destruction, and crowneth thee with loving kindness and tender mercies. As the heaven is high above the earth, so great is his mercy toward them that fear him. The mercy of Jehovah is from everlasting to everlasting, upon

\* In this, and several other quotations from the Scriptures, the literal rendering from the Hebrew is substituted in place of the common translation, and the supplements are frequently omitted.

them that fear him; and his righteousness unto children's children. Many, O Lord, my God, are thy wonderful works, which thou hast done, and thy thoughts to us ward; they cannot be reckoned up in order unto thee; if I would declare and speak of them, they are more than can be numbered.—I will praise thee, for I am fearfully and wonderfully made: marvellous are thy works. How precious are thy thoughts (or designs) towards me, O God! how great is the sum of them! If I should count them, they are more in number than the sand."

Thus it appears, that both the system of nature, and the system of revelation, concur in exhibiting the wisdom and benevolence of the Deity as calculated to excite the highest degree of ardent affection in the minds of the whole intelligent creation. If an atom of gratitude is due to an earthly benefactor, it is impossible to set bounds to that affection and gratitude which ought incessantly to rise in our hearts towards the Creator of the universe, who is the "Father of mercies, and the God of all consolation." And, therefore, we need not wonder, that "holy men of old," whose minds were overpowered with this sacred emotion, broke out into language which would be deemed extravagant, by the frigid moralists of the present age. Under a sense of the unbounded love and goodness of God, the psalmist felt his heart elated, and formed these pious resolutions: "Seven times a day will I praise thee, O Lord! At midnight will I rise to give thanks to thee, because of thy righteous precepts, I will rejoice in the way of thy precepts, as much as in all riches. The law of thy mouth is better unto me than thousands of gold and silver. Oh, how I love thy law! it is my meditation all the day. I will speak of thy testimonies before kings, and will not be ashamed of thy commandments. Whom have I in heaven but thee? and there is none upon earth that I desire beside thee. As the hart panteth after the brooks of water, so panteth my soul after thee, O God!" Under similar emotions, the Apostle Paul exclaims, "I am persuaded that neither death, nor life, nor angels, nor principalities, nor powers, nor things present, nor things to come, shall be able to separate us from the love of God, which is in Christ Jesus our Lord."

## SECTION V.

### ON THE MERCY AND PATIENCE OF GOD.

Another feature in the divine character, which is peculiarly calculated to excite admiration, affection, and gratitude, is the *mercy and patience of God*.

Mercy has its source in the divine goodness, and may be considered as a particular modifica-

tion of the benevolence of the Deity. Goodness is the *genus*, mercy the *species*. The goodness of God extends to all the creatures he has formed, of whatever description or character,—to the fowls of the air, the fishes of the sea, the microscopic animalcula, and the most wicked class of human beings, as well as to angels, archangels, and other superior intelligences. Mercy can have a reference only to those who have sinned against their Maker, and rendered themselves unworthy of his favours. It consists in the bestowment of blessings upon those who have forfeited every claim to them, and have rendered themselves obnoxious to punishment. It cannot be exercised toward "the angels who have kept their first estate," or towards any other class of holy intelligences, because they do not stand in need of its exercise.—The *patience or forbearance* of God, is that attribute of his nature which consists in his bearing long with sinners, and refraining from inflicting deserved punishment, notwithstanding their impenitence, and long-continued provocations.

These attributes are seldom displayed, in our world, by one man, or class of men, towards another. Instead of clemency, mercy, and forbearance, we find in the character of mankind, as delineated in the page of history, the principle of *revenge* operating more powerfully than almost any other disposition; and, therefore, when any striking instance of mercy and long-suffering is exhibited in human conduct, we are disposed to wonder at it, and to admire it as an extraordinary moral phenomenon. When we behold a personage who is possessed of every degree of moral and physical power for crushing his enemies—yet remaining calm and tranquil, and forbearing to execute deserved punishment, notwithstanding repeated insults and injuries, we are led to admire such qualities, as indicating a certain degree of greatness and benevolence of mind. On this principle, we admire the forbearance of David, the anointed king of Israel, towards Saul, his bitterest enemy, when he had an opportunity of slaying him at the cave of Engedi; and afterwards, when he was sleeping in a trench at Hachila;—and at the clemency which he exercised towards Shimei, who had cursed and insulted him, and treated him most reproachfully. On the same principle, we admire the conduct of Sir Walter Raleigh, a man of known courage and honour, towards a certain rash, hot-headed youth. Being very injuriously treated by this impertinent mortal, who next proceeded to *challenge* him, and, on his refusal, spit on him, and that too in public;—the knight taking out his handkerchief, with great calmness, made him only this reply: "Young man, if I could as easily wipe your blood from my conscience, as I can this injury from my face, I would this moment take away your life."

In order to exhibit the mercy and long-suf-

being of the Deity in their true light, let us consider, for a moment, some of the leading features in the conduct and the character of mankind.—Whether we go back to the remote ages of antiquity, or review the present moral state of the inhabitants of our globe, we shall find the following, among other similar traits, in the character of the great mass of this world's population;—*An utter forgetfulness of God, and the prevalence of abominable idolatries.* Though an invisible and omnipotent energy may be clearly perceived in that majestic machinery by which the vault of heaven appears to be whirled round our globe from day to day; and though every returning season proclaims the exuberant goodness of that Being who arranged our terrestrial habitation,—yet, of the great majority of human beings that have hitherto existed, or now exist, it may with truth be said, that “God is not in all their thoughts, and the fear of God is not before their eyes.” And how grovelling have been the conceptions of those who have professed to offer their adorations to a superior Intelligence! They have changed the glory of the incorruptible God into an image made like to corruptible man, and have invested with the attributes of divinity a block of marble, the stock of a tree, a stupid ox, and a crawling reptile: to which they have paid that worship and homage which were due to the Almighty Maker of heaven and earth.—*Blasphemy and impiety* is another characteristic of the majority of our species. How many have there been of our wretched race in all ages, and how many are there in the present age, who “set their mouths against the heavens in their blasphemous talk,” and “dare defy the Omnipotent to arms!” They say to God, “Depart from us, for we desire not the knowledge of thy ways: What is the Almighty, that we should serve him? and what profit should we have, if we pray unto him?” While his hand is making their pulse to beat, and their lungs to play, and while he is distributing to them corn, and wine, and fruits in rich abundance, they are blaspheming his venerable Majesty, and prostituting these very blessings for the purpose of pouring dishonour on his name.

The *diabolical passions* which men have displayed towards one another, is another striking trait in their character. War has been their employment and their delight in every age. Thousands of rational beings of the same species have set themselves in array against thousands, and have levelled at each other spears, and arrows, and darts, and musquetry, and cannon, and every other instrument of destruction, till legs and arms, and skulls, and brains, were mingled with the dust—till the earth was drenched with human gore—till cities, and towns, and villages, were tumbled into ruins, or given up as a prey to the devouring flames—and till the bounties of Providence, which God had provi-

ded for man and beast, were destroyed, and trampled down as the mire of the streets. And, what adds to the enormity of such dreadful passions, they have often had the effrontery to implore the assistance of the God of mercy in this work of horror and destruction. When, to all these abominable dispositions and practices, we add, the numerous other acts of atrocity, that are daily committed in every quarter of the world,—the oppression and injustice which the poor, the widow, and the fatherless have suffered from the overwhelming hand of power; the persecutions which tyranny has inflicted on the select few, who have raised their voices against such abominations; the falsehood, and treachery, and perjury, which are rampant in every land, the lewd and unnatural crimes that are daily committed; the thefts, and murders, and assassinations, that are incessantly perpetrating in some one region of the world or another; the haughty pride and arrogance which so many of the puny sons of men assume; the murmurings and complainings at the dispensations of Providence, and the base ingratitude with which the majority of mankind receive the bounties of heaven;—and when we consider, for how many thousands of years these abominable dispositions have been displayed, we have reason to wonder that condign punishment is not speedily executed, and that the Almighty does not interpose his omnipotence, to shatter this globe to atoms, and to bury its inhabitants in the gulf of everlasting oblivion.

Yet, notwithstanding these depraved and ungrateful dispositions; notwithstanding that this spacious world, which was erected for a temple to the Deity, has been turned into a temple of idols, its seas and rivers stained, and its fields drenched with the blood of millions of human beings, and its cities transformed into a sink of moral pollution; in spite of all these innumerable and aggravated provocations, the God of heaven still exercises his mercy, long-suffering, and forbearance. He impels the earth in its annual and diurnal course, to bring about the interchanges of day and night, and the vicissitudes of the seasons; he makes his sun to arise on the world, to cheer the nations with his light and heat; he sends his rains, to refresh the fields, both of “the just, and of the unjust;” he causes the trees, the herbs, and the flowers, to bud and blossom every returning spring; he ripens the fields in harvest; he crowns the year with his bounty, and encircles the little hills with rejoicing. Instead of “sending forth his mighty winds,” in incessant storms and hurricanes, to tear up whole forests by their roots, and to lay waste the productions of the soil, he fans the groves and the lawns with gentle breezes, and odoriferous gales. Instead of opening the cataracts of heaven, and dashing down overwhelming torrents, to deluge the plains, and frustrate the hopes of man, he

refreshes the parched ground with gentle showers, as if they proceeded from a watering-pot. Instead of confining our sensitive enjoyments to bread and water, as if we were the tenants of a jail, he has strewed our gardens and fields with every variety of luxuriant delicacies, to gratify every appetite. Instead of directing the lightnings to set on fire the mountains, and to level our cities to the ground, and the thunders to roll incessantly around us, he commands this terrific meteor to visit us only at distant intervals, and in its gentler operations, just to remind us what tremendous instruments of destruction he is capable of wielding, and that we ought to "be still and know that He is God," and that "he has punished us less than our iniquities deserve." O that man would praise the Lord for his mercy, and for his long-suffering towards the children of men!

This character of God is *peculiar to himself*, and cannot be supposed to belong, unless in a very inferior degree, to any created intelligence. Were the meekest man that ever appeared on the theatre of our world—or were even one of the highest intelligences in heaven to be invested with a portion of the attribute of omniscience; could he penetrate, at one glance, over all that hemisphere of our globe on which the sun shines, and, at the next glance, survey the other hemisphere which is enveloped in darkness; could his eye pierce into the secret chambers of every habitation of human beings, in every city, and town, and village, and especially into those haunts where crimes are veiled by the shades of night from every human eye; could he behold at one glance all the abominations that are hourly perpetrating in every region of the world—the pagan worshippers in Thibet and Hindostan, performing their cruel and execrable rites—the wheels of Juggernaut crushing to death its wretched devotees—the human victims which are tortured and sacrificed, to gratify the ferocity of some barbarous chief—the savage hordes of New Zealand, feasting on the flesh of their fellow-men, whom they have cruelly butchered, and drinking their blood out of human skulls—the Indians of America, tearing with pincers the flesh of their prisoners, and enjoying a diabolical pleasure in beholding their torments—the haughty inquisitors of Spain insulting their devoted victims, in the name of the merciful Saviour, and preparing tortures, and stakes, and flames for their destruction—the assassin plunging his dagger into his neighbour's bosom—the midnight robber entering into the abode of honest industry, strangling its inmates, and carrying off their treasures—the kidnapper tearing the poor African from his wife and children, and native land—the unfeeling planter and overseer lashing his degraded slaves—tyrants and persecutors dragging "the excellent ones of the earth" to prisons, to dungeons, and to gibbets—the malevolent and en-

vicious man devising schemes for the ruin and destruction of his neighbour—the mutinous crew, in the midst of the ocean, rising up against their superiors, slashing them with their sabres, and plunging their bodies into the deep—the gamester ruining a whole family by a throw of the dice—the skeptic sporting with the most sacred truths—the atheist attempting to defy the Omnipotent—the prostitute wallowing in the mire of uncleanness—the drunkard blaspheming the God of heaven in his midnight revels—numerous tribes of human beings, in every quarter of the globe, dashing out each other's brains in mutual combat—hypocritical professors of religion, harbouring malice and revenge against their brethren—and thousands of other iniquitous scenes which are daily presented before the pure eyes of Omniscience; could he behold all the abominable acts of this description which are perpetrated on the surface of our globe, in the course of a *single day*, and were the elements under his control, for executing condign punishment on transgressors,—it is more than probable, that, before another day dawned upon the world, the great globe we inhabit would be shattered to its centre, and enveloped in devouring flames. For no finite intelligence could refrain his indignation for a length of years, or could penetrate into all the reasons, why "sentence against an evil work should not be *speedily* executed;" why the murderer should not be arrested by death before his hand is lifted up to strike; why the tyrant should not be cut off before his victims are secured; and why the slave should be doomed to drag out so many long years under the rod of a relentless master. But God beholds all these actions in all their bearings and relations to the plan of his government, and in all their eternal consequences; and beholding them, he "keeps silence," and refrains from executing immediate and deserved punishment.

This part of the divine character, when seriously considered, is calculated to excite strong emotions of admiration and wonder; and these emotions must be raised to their highest pitch, when we consider the many instruments of vengeance which are every moment wielded by the hand of the Almighty. If forbearance were owing to *impotence*, or a want of means for the infliction of retributive justice, our admiration would cease. But all the elements of nature are under the immediate control of the Governor of the universe; and, in a thousand modes incomprehensible by us, He could make them the instruments of his vengeance to chastise a guilty world. "For in his hand is the soul of every living thing, and the breath of all mankind." Let us consider, for a little, some of those agents which lie within the sphere of our knowledge in the system of nature.

Of all the elements of nature, there is none more delightful and beautiful in its effects than

*light.* "Truly the light is sweet, and a pleasant thing it is for the eyes to behold the sun." It diffuses a thousand shades of colouring over the hills, the vales, the rivers, and the boundless deep, and opens to our view the glorious host of heaven. Yet this delightful visitant, by a slight modification, from the hand of Omnipotence, is capable of being transformed into the most destructive element in nature. Light flies from the sun at the rate of 200,000 miles in a second of time; and it is owing to its particles being almost infinitely small, that we feel no inconvenience from their rapid velocity. But, were the Creator to condense several millions of these particles into one, or impel them with a still greater velocity, the solid crust of our globe would be perforated and shattered in every point by this celestial artillery, and its inhabitants would soon be battered to atoms.

Again, the *atmosphere* which surrounds us, and in which we live and breathe; which contains the principles of life; which fans us with its gentle gales, and wafts to our ears the harmonies of music—is capable of being converted into an instrument of terror and destruction. It is composed chiefly of two different ingredients; one of these is the principle of flame,—and if the other ingredient were extracted from the atmosphere, and this principle left to exert its native energy without control, instantly the forests would be in a blaze; the hardest metals, and the most solid rocks, would melt like wax; the waters of the ocean would add fuel to the raging element; and, in a few minutes, the whole expanse of our globe would be enveloped in one devouring flame.

Again, the globe on which we reside is whirling round its axis every twenty-four hours, and is carried round the sun with a still greater velocity. Should that Almighty arm which first impelled it in its career, cause these motions suddenly to cease, mountains would be tumbled into the sea, forests torn up by their roots, cities overthrown and demolished, all nature would be thrown into confusion, and terror and destruction would overwhelm the inhabitants of the world. Not only the stopping of the earth's motions, but even a new direction given to its axis of rotation, would be productive of the most fatal effects. The earth's axis at present is directed to certain points of the heavens, from which it never deviates, but in a very small degree; but were the hand of Omnipotence to bend it so as to make it point in a different direction, the ocean would abandon its present bed, and overflow the land; and a second universal deluge would overwhelm all the monuments of human grandeur, and sweep the earth's inhabitants into a watery grave.

Again, not only the elements which immediately surround us, but even celestial bodies which are just now invisible to our sight, and removed

to the distance of a thousand millions of miles might be employed as ministers of vengeance. There are at least a hundred *comets* connected with the solar system, which are moving in all directions, and crossing the orbits of the earth, and the other planets. Were the orbit of one of these bodies, in its approach to the sun, to be bent in a direction to that of the earth, the most alarming phenomena would be exhibited in the heavens. A ruddy globe, larger in appearance than the moon, would first announce terror to the inhabitants of the earth—every day this terrific object would increase in size, till it appeared to fill the celestial hemisphere with its tremendous disk;—the light of the sun would be eclipsed—the stars would disappear—the ocean would be thrown into violent agitation, and toss its billows to the clouds—the earth would "reel to and fro, like a drunkard"—and universal alarm and confusion would seize upon all the tribes of the living world. At length, this tremendous orb would approach with accelerated velocity, and, striking the earth with a *crash*, as if heaven and earth had burst asunder, would shiver the globe into fragments, and for ever exterminate the race of man.

It will at once be admitted, by every one who acknowledges the incessant agency of a Supreme Being in the movements of the universe, that any one, or all of these effects combined, are within the compass of Omnipotence; and not only so, but they might all be accomplished with terrific energy in the course of a few moments. If puny man, by his mechanical dexterity, can suddenly stop a stupendous machine which he has put in motion—if he can impel red-hot balls at the rate of 500 miles an hour—if he can extract the oxygen from a small portion of the atmosphere, and cause it to set on fire the hardest metallic substances—we cannot doubt for a moment, that, with infinitely greater ease, the Almighty could stop the earth in its career, separate the component parts of the atmosphere, set on fire the foundations of the mountains, or impel the blazing comet towards the earth, to crush it to atoms. That God has been a constant spectator of the wickedness of man for four thousand years; that he has, during all that period, wielded in his hands so many terrific ministers of vengeance; and that he has hitherto refrained from executing deserved punishment on the workers of iniquity—is, therefore, a striking evidence that his mercy is infinite, and that he is "long-suffering and slow to anger, not willing that any should perish, but that all should come to repentance."

It would, however, be a most unwarrantable conclusion, from this circumstance, to imagine that God beholds with indifference the scenes of iniquity that are hourly presented before him. In order to show that he is not an unconcerned spectator of the ways of men, and that the instruments of punishment are always in his hand, he

sometimes "cometh out of his place, to punish the inhabitants of the earth for their iniquity," and displays the holiness of his nature, by "terrible things in righteousness." In such visitations, "his way is in the whirlwind and the storm; clouds and darkness are round about him; a fire goeth before him, and burneth up his enemies round about; the stormy winds are his messengers, and flames of fire his ministers; the clouds pour out their waters; the sky sends forth a sound; the voice of his thunder is in the heavens; his lightnings enlighten the world; the earth quakes and the people tremble." The hurricanes, which tears up whole forests by the roots, and tosses them about as stubble, which levels the loftiest spires with the ground, and dashes the stateliest ships against each other, till they are broken into shivers, and plunged into the deep; the lightnings, which fill the atmosphere with their blaze, which shatter the strongest buildings, and strike whole herds of cattle into a lifeless group; the pestilence, "which walketh in darkness," and cuts off thousands of its victims in a day; the volcano, belching forth rivers of fire, causing surrounding cities to tremble, and sending forth its bellowings over a circuit of a thousand miles;—these, and many other agents which are in operation in the system of nature, are experimental proofs of the dreadful energy of those ministers of destruction, which are constantly under the superintendence of the Almighty, and of his occasionally using them for the purpose of chastising the nations for their iniquities.

In particular, the earthquake is one of the most terrible and destructive instruments of vengeance. In the year 1755, the shock of an earthquake was felt at Lisbon, which levelled to the ground more than half of that populous city, and buried fifty thousand of its inhabitants in the ruins. The shock extended its influence over an extent of four millions of square miles; and therefore, it is easy to conceive, that, had a little greater impulse been given to the physical agents which produced this terrible effect, the solid globe on which we stand might have been convulsed to its centre, and all its inhabitants crushed to death, amidst the universal ruin.

We have also an experimental proof, that there are physical principles in the constitution of our globe, sufficient to give it a shock throughout every part of its solid mass, and that such a shock, at one period, it actually received. When the wickedness of man became great upon the earth, "when every imagination of the thoughts of his heart was only evil continually," the fountains of the great deep were broken up, the cataracts of heaven were opened, and the whole solid crust of our globe received such a shock as rent the mountains asunder, and hurled them into the plains; the effects of which are still visible, in every Alpine district, and in the subterraneous caverns of the earth. Of all the

millions of the race of Adam that then existed, only eight individuals, after having been tossed for seven months on the tremendous billows of a boundless ocean, survived, to tell to their posterity the tidings of this universal wreck. The dreadful scenes of horror and consternation which must have been presented at this awful crisis; the stupendous forces which must have been in operation in the atmosphere above, and in the foundations of the earth beneath, and the tremendous clash of elemental war which must have ensued, throughout every region of earth, air, and sea,—it is beyond the power of the human imagination to depict, in all their terrific grandeur. But we have every reason to conclude, that the bottom of the ocean was lifted up to the level of the loftiest mountains, that disruptions of the mountains and of the densest rocks ensued, that dreadful explosions resounded throughout the whole expanse of nature, and that the mighty waters hurled their billows with resistless fury in every direction, rolling immense rocks and forests from one continent to another, and whirling the wrecks of different regions to the opposite extremities of the globe.

Were it at any time the intention of the Almighty to inflict deserved punishment on a particular district, or class of men, without deranging the whole structure of our globe, we have also an experimental proof how easily this could be effected, even without infringing the established laws of nature. He has only to condense the powerful energies of the electrical fluid in a large cloud, and to despatch it on the wings of the wind, to discharge its thunderbolts on any particular city, or mountain, or plain,—and the work of destruction is instantly accomplished. A striking instance of this kind happened, in the year 1772, in the island of Java, in the East Indies. On the 11th of August, at the dead hour of night, a bright cloud was observed covering a mountain in the district of Cheribon, and at the same moment several reports were heard, like those of a cannon. The people who dwelt on the upper parts of the mountain not being able to fly with sufficient swiftness, a great part of the cloud, about nine miles in circumference, detached itself under them, and was seen at a distance, rising and falling like the waves of the sea, and emitting globes of fire so luminous, that the night became as clear as day. The effects of this dreadful explosion were astonishing. Every thing was destroyed for twenty miles around. The houses were demolished; the plantations were buried in the earth; vast numbers of goats, sheep, and horses, and 1500 head of cattle were destroyed; and above two thousand human beings were in a moment plunged into the gulf of eternity.\* "With God is terri-

\* In this, and the other illustrations of this subject stated above, I consider the Divine Being as the grand agent in directing the operations of the ele-

the majesty. Who can stand before his indignation? who can abide in the fierceness of his anger? The mountains quake before him; the hills melt, and the earth is burned at his presence."—"Let all the earth fear the Lord; let all the inhabitants of the world stand in awe of him."

Thus it appears, that God is not an unconcerned spectator of the ways of men—that he has every moment at his command the most destructive elements of nature—and that we have abundant proofs that these destructive elements have been occasionally used, for inflicting condign punishment on the workers of iniquity. Notwithstanding these resources of vengeance, we find, by experience, that his mercy is exercised, from year to year, and from century to century, towards a world, the majority of whose inhabitants are daily trampling under foot his sacred institutions, and his holy laws. The instances which occur, of the devastations of the hurricane, the thunder, the volcano, the earthquake, and the pestilence, are comparatively few, and seem intended chiefly to arouse the attention of thoughtless and ungrateful man; to prevent him from running to the extreme of wickedness; and to convince him that the Most High ruleth in the kingdoms of men," and that "verily there is a God who judgeth in the earth." Hence we may perceive the striking emphasis of the language of the inspired writers: "The Lord is *slow to anger*," and yet "*great in power*."

This display of the exercise of perfect self-command in the Divine Mind, is, therefore, calculated, as well as his wisdom and goodness, to inspire us with emotions of reverence, admiration, and love. "The Lord is merciful and

merciful, but without infringing those general laws which are found to operate with undeviating constancy in the system of the universe. To explore the manner in which those general laws are directed to produce certain specific effects, in reference to particular regions and tribes of mankind, must obviously be beyond the limits of our faculties; unless we could enter into all the designs of the Eternal Mind, when he gave birth to the universe, and arranged its elementary parts; and unless we could take a comprehensive view of the remotest tendencies of the elements of nature, and the times and circumstances in which they shall produce a specific and extraordinary effect. All these tendencies and circumstances were before the mind of the Eternal Jehovah, when he established the plan of his moral government; and, therefore, whatever events may occur in the physical system, must be considered as the accomplishment of his moral purposes, in reference to the moral agents he has created. It would be presumptuous in so limited a being as man, to determine, in every case, what is the precise moral reason of the extraordinary destructive effects of physical agents. We can only say, in general, that they are connected with the sin and depravity of man. But, at that solemn day, when the reasons of the divine dispensations shall be laid open, it will perhaps be found, that such uncommon and alarming effects were the punishment of aggravated transgressions, the peculiar malignity and tendency of which were removed, in a great measure, beyond the sphere of general observation,

gracious, slow to anger, and plenteous in mercy. As the heaven is high above the earth, so great is his mercy toward them that fear him. Bless the Lord, O my soul, and forget not all his benefits."

## SECTION VI.

### OF THE RECTITUDE OF THE DIVINE CHARACTER.

Another perfection in the character of God, which is calculated to inspire confidence and affection, is his *Justice*, or, the *Rectitude* of his nature.

The rectitude of the Divine Being, in its most extensive sense, consists in doing that which, in all cases, is *right*, upon the whole; or, in other words, that which will have the greatest tendency to promote the order and happiness of his universal empire. It includes under it, the idea of *distributive justice*, which consists in rewarding the good, and punishing the bad, according to equitable laws, calculated to produce harmony and happiness throughout the whole intelligent system. This perfection of the Deity may be considered as a branch of his general *benevolence*, which appears to be the source of all his moral attributes, and the spring of all his actions. The display of his natural and moral perfections, and the general happiness of the intelligences which exist throughout his immense and eternal empire, appear to be the great objects in view, in his moral government of the universe: and, in order to secure these objects, it is requisite that justice be impartially administered, according to the eternal rules of rectitude, and that "every one be rewarded according to his works."

That this attribute is possessed by the Divine Being, in the highest degree, appears from the following considerations. He exists, and has always existed, completely *independent* of all his creatures; he is in the actual possession of boundless felicity, which no other being can interrupt; and is consequently liable to no evil, nor diminution of enjoyment. He is *omnipotent*, and therefore can accomplish whatever he pleases, and can effectually prevent whatever might detract from his happiness, or disturb the order of his government. He has, therefore, nothing to fear from any other being, and can desire nothing from his creatures to increase his felicity. Consequently, *no possible motive or temptation can exist*, to induce him to inflict an act of injustice on any of the intellectual beings he has formed. Injustice, among men, proceeds either from want of intelligence to discriminate between what is right and wrong; from want of power to bring their purposes into effect; from

the fear of some evil or disadvantage which may arise from the impartial distribution of justice; from the idea of some imaginary good of which they might be deprived; from some mental defect incident to the present state of humanity; from some prejudice against the individuals towards whom justice ought to be administered; or from the indulgence of some cruel and depraved dispositions. But none of these causes or motives can exist in the mind of the All-perfect and infinite Creator. His comprehensive eye takes in, at one glance, all the circumstances, even the most minute, on which a righteous decision depends; he is no "respector of persons;" he can indulge no malevolent dispositions; he can expect no accession of enjoyment from an act of injustice; he has nothing to fear from the execution of his decisions; his power is all-sufficient to bring them into full effect, at the time, and in the manner, which is most conducive to the happiness of the universe; and his benevolence, which is displayed throughout all his works, effectually prevents him from withholding good, or inflicting evil, beyond the desert of the subjects of his government.

This character of the Deity is amply exhibited and confirmed in the declarations of Sacred Scripture, where it is asserted, that "He is a God of truth, and without iniquity; just and right is he." "Thou art just," says Nehemiah, "in all that is brought upon us; for thou hast done right, but we have done wickedly." "Shall mortal man be more just than God? Surely God will not do wickedly, neither will the Almighty pervert judgment. Wilt thou condemn Him that is most just? Is it fit to say to a king, Thou art wicked; or to princes, Ye are ungodly? How much less to him who accepteth not the persons of princes, nor regardeth the rich more than the poor?"—"The righteous Lord loveth righteousness; he shall judge the world in righteousness; he shall minister judgment to the people in uprightness. Justice and judgment are the foundation of his throne. The Lord our God is righteous in all his works which he doth." "I am the Lord who exercise judgment and righteousness in the earth." "God is not unrighteous to forget your work and labour of love which ye have showed towards his name.—Great and marvellous are thy works, Lord God Almighty; *just and true* are thy ways, thou King of saints." The equitable laws which he has promulgated to his creatures; the justice he requires to be exercised by one man to another; his promises of reward, and his threatenings of punishment; and the impressive judgments which he has executed on individuals, on nations, and on the world at large, all bear testimony to the existence of perfect rectitude in the divine character.

But, although Scripture and Reason combine in attesting the immutable justice of God, we are

unable, in many instances, to trace the display of this perfection in his dispensations towards the inhabitants of our world. This is owing, in part, to the false maxims by which we form a judgment of his procedure; to the limited views we are obliged to take of the objects of his government; to the want of a comprehensive knowledge of the whole plan of his dispensations, and the ends to be effected by them; to the limited views we have acquired of the whole range of his universal dominions; and to our ignorance of the relations which may subsist between our world and the inhabitants of other provinces of the divine Empire. We behold many of "the excellent of the earth," pining in the abodes of poverty, and almost unnoticed by their fellow-men; while we behold the wicked elevated to stations of power, and encircled with riches and splendour. From a false estimate of true enjoyment, we are apt to imagine, that misery surrounds the one, and that happiness encircles the other; and that there is an apparent act of injustice in these different allotments; whereas, God may have placed the one in the midst of worldly prosperity as a punishment for his sins, and the other in obscurity, as a stimulus to the exercise of virtue. We behold a man of piety and benevolence falling before the dagger of an assassin, who escaped with impunity: we are startled at the dispensation, and confounded at the mystery of providence, and are apt to exclaim, "Is there not a God that judgeth in the earth?" But, we are ignorant of the relation which such an event bears to the general plan of the divine government—of the links in the chain of events which preceded it, and of those which shall follow in its train. We are ignorant of the relation it bears to particular families and societies, or to the nation at large in which it happened, and even to all the nations of the earth. An event apparently trivial, or mysterious, or, according to our views, unjust, may, for aught we know, form an essential link in that chain of events which extends from the commencement of time to its consummation, which runs through a thousand worlds, and stretches into the depths of eternity. We all know, that some of the most appalling scenes of terror and destruction have often proceeded from an apparently trivial accident, and that events of the greatest importance have originated from causes so inconsiderable as to be almost overlooked. The British and Foreign Bible Society, which now engages the attention of the whole mass of the Christian world, and whose beneficent effects will soon extend to the remotest corners of the world, derived its origin from a casual conversation between a few obscure individuals, on the subject of distributing the Scriptures. And the apparently trivial circumstance, of observing that a certain mineral substance, when left free to move itself, uniformly points towards the north, has been the means, not only

of the knowledge we have acquired of the different regions of our globe, but of imparting to millions of mankind incalculable blessings, which will descend to their posterity to the latest generations.

Hence it appears, that, in our present circumstances, we are altogether incompetent to form a correct judgment of what is just or unjust in the present dispensations of the Almighty, unless we could survey, with the eye of a seraph, the ample plan of the divine government,—the whole chain of God's dispensations towards our race,—the numerous worlds and beings over which his moral government extends,—the relation which the events now passing among us bear to other moral intelligences, either as subjects of contemplation, as warnings of the danger of apostasy from God, or as motives to universal subjection and obedience,—and the connexions, bearings, and dependencies of the whole of that moral system which embraces unnumbered worlds, and constitutes one grand and boundless empire, under the government of the Creator.—Even then, with the eye and the mind of a finite intelligence, we should occasionally meet with events which would surpass our comprehension, and be altogether inexplicable, on the grounds of the knowledge we had previously acquired, and should still be constrained to exclaim, "O the depth of the riches both of the wisdom and the knowledge of God! How unsearchable are his judgments, and his ways past finding out!"

But although "clouds and darkness" at present hang over the ways of the Almighty, so that we cannot, in every instance, perceive the rectitude of his procedure, we may rest satisfied that "justice and judgment are for ever the foundation of his throne;" and we are assured, by the Sacred Oracles, that a period is approaching, when the mystery of Providence will be unfolded, and when all its dark and perplexing events, in reference to this world, will be explained to the full conviction of all its assembled inhabitants. For "God hath appointed a day in which he will judge the world in righteousness by that man whom he hath ordained; whereof he hath given assurance unto all men, in that he hath raised him from the dead." Then "the secrets of all hearts" shall be disclosed, and every man rewarded "according to his works;" for, "God shall bring every work into judgment, with every secret thing, whether it be good, or whether it be evil." Then it will be clearly perceived, that "verily there is a reward for the righteous, and that there is a God that judgeth in the earth." Then the rectitude of Jehovah, in every part of his moral administration, will shine forth in all its lustre; a visible and everlasting distinction will be made between the righteous and the wicked, and the whole intelligent creation will plainly discern between "him that served God, and him that served him not."

In the mean time, God has not left us without a witness to the impartiality of his justice in his allotments towards men, in that he has invariably connected misery with the violation of his laws, and happiness with the observance of them. However different the allotments of mankind may be, in regard to wealth, honour, or station, it holds invariably true, that "there is no peace," or substantial happiness, "to the wicked;" and that "the man is blessed who fears the Lord, and delights in his commandments."\* Place a man on the highest pinnacle of earthly grandeur, and let him indulge in schemes of ambition, avarice, pride, revenge, cruelty, and other violations of the divine law, and he may as soon attempt to stop the sun in his course, as to expect substantial enjoyment while he continues in the indulgence of such malevolent passions. Place another in the most obscure abode of human life, and let him exercise piety, benevolence, humility, and every other Christian temper; and he will enjoy a peace, an equanimity, and a portion of happiness, which the wicked can never possess, and which the wealth of the world can neither give nor take away. Hence it is, that we behold so many instances of disgust at life, and of self-destruction, among those who are elevated to stations of power, and surrounded with every kind of sensitive enjoyment.—This consideration, of itself, should silence every murmur that is apt to arise at the dispensations of God's providence, and convince us that "he is righteous in all his ways, and holy in all his works."

On the whole, then, it appears, that the justice of God has a tendency to inspire us with confidence, and love, and joy, no less than his mercy and benevolence. Were it not for this perfection of the divine character, omnipotence might become a most terrific and tremendous attribute of the Deity. We should have no motive but that of fear to stimulate us to obedience; we should feel no security against danger, and distress, and the perpetual recurrence of spectacles of vengeance, and, in the course of ages, the spacious universe might be transformed into an immense region of "lamentation, and mourning, and woe." Were it not for this perfection, the benevolence of the Deity would degenerate into weakness and imbecility. Wicked men, and other depraved intelligences, presuming on freedom from impunity, and their diabolical passions acquiring strength and vigour, by long exercise, would carry misery and destruction in their train, wherever they exerted their energies; and would interrupt, and ultimately destroy the harmony and felicity of the intelligent universe. But, while we recognize the rectitude of the divine character as an immutable attribute of Deity, we can look forward with confidence through all the revolu-

\* Psal. cxli. 1.

“less of time, and to all those eternal scenes which shall succeed the demolition of the present systems of things, fully assured, that God is the universal Protector of his unnumbered offspring—that his power will never be interposed to inflict an act of injustice—that no intelligent being will ever suffer a punishment beyond his desert—and that no happiness which his benevolence has devised, and his word has promised, will ever be withheld from those “who put their trust in his name, and hearken to the voice of his commandments.”

Thus I have endeavoured to show, that *love to God*, which is the first principle of the moral law, is founded upon the natural and moral perfections of the Deity—that the attributes of *omnipotence, wisdom, goodness, mercy, forbearance, and justice*, are calculated to excite this noble affection to the highest degree in the minds of all holy intelligences. I might also have illustrated this subject from considerations drawn from the infinity, the eternity, the immutability, the holiness, and veracity of God. But the illustrations already stated, will, I presume, be sufficient to demonstrate, that this affection, in conjunction with all its kindred emotions, ought to occupy the highest place in the human heart, and in the minds of all created intelligences.

It may, perhaps, be insinuated by some, that the preceding illustrations have been carried to a greater length than the nature of the subject required—and it is readily admitted; that the mere logical argument did not require so extended illustrations. Every person who knows the meaning of the terms made use of, will at once admit, that, since God is a Being possessed of almighty power, infinite wisdom, boundless benevolence, mercy, forbearance, and perfect rectitude—he ought to be loved affectionately and supremely. But such general and metaphysical reasoning, though perfectly conclusive and incontrovertible, possesses but a slender influence over the mind, in exciting it to the cultivation of holy affections. For the sake of impression, it is essentially requisite, that the various manifestations of divine perfection should be presented to the view, in order that the mind may have a tangible train of thought before it, to stimulate its activities, and its religious emotions. General views and reasonings on any subject, and especially on the subject of religion, produce a very slight impression on the majority of mankind. It is not owing so much to the want of conviction of the truth of certain important propositions in religion, that divine truths take so slender a hold of the mind, as to the want of those definite and impressive conceptions which can be acquired only by a minute and attentive survey of the works and the dispensations of God. And, in this point of view, the preceding illustrations, had the limited nature of the present

work permitted, might have been prosecuted to a much greater extent.

I might also have illustrated this subject from a consideration of the relations in which God stands to us, and to all his creatures. He is our Creator, and we are the workmanship of his hands. He formed our bodies, and he sustains our spirits. His physical energy is felt by us every moment, in making our hearts to beat, and our lungs to play, and in impelling the crimson fluid which circulates in our bodies, through a thousand different tubes. To him we are indebted for life, and all its comforts; and for all the powers, capacities, and privileges, which dignify our nature, and exalt us above the lower ranks of existence. He is our Preserver and bountiful Benefactor, who “sustains our souls in life,” who supports the course of nature, in its diversified movements, and “daily loads us with his benefits.” To his superintending providence we are indebted for the food we eat, the water we drink, the clothes we wear, the air we breathe, the light which cheers us, the splendours of the sun, the milder radiance of the moon, the magnificence of the starry sky, the rains and dews which fertilize the soil; the earth, with its riches and abundance; the trees, plants, and waving grain, which enrich our fields; the flowers which deck the meadows, the beautiful and magnificent colouring which is spread over the terrestrial landscape, the succession of day and night, and the vicissitude of the seasons. In short, to him we are indebted for all the objects and movements around us, which render our abode on earth convenient, desirable, and productive of enjoyment.

He is our Father, and we are his children. He watches over us with a tender care; and, “as a father pitieth his children, so the Lord pitieth them that fear him.” This tender and indissoluble relation binds us to him by the strongest ties, and is calculated to excite the most ardent filial affection and gratitude. He is our Sovereign and Lawgiver, and we are his subjects; and all his laws are framed on the principles of eternal and immutable rectitude, and are calculated to promote the harmony and happiness of the whole intelligent creation. He is our Master, and we are his servants, and “his commandments are not grievous.” He is our Friend in adversity, our Protector in danger and in distress; our Instructor, who has imparted to us knowledge and understanding; and our Redeemer, who “spared not his own Son, but delivered him up for us all,” that we might be rescued from the gulf of depravity and ruin, and exalted to a state of consummate felicity. In fine, he is that being who is the inexhaustible fountain of light, of life, and of joy to all beings—on whom depend all our future prospects in this world, and all the transporting scenes to which we look forward in an interminable state of

existence. —All these, and many other relations, in which we stand to the God of heaven, demonstrate, that supreme love to this beneficent Being, is the first and highest duty of every rational creature; and they present the most powerful motives to stimulate us to its exercise. But, to illustrate these topics, in minute detail, would be inconsistent with the limited plan of the present work; and it is the less necessary, as several of them have already been brought into view, in the course of the preceding illustrations.

## SECTION VII.

### MODES IN WHICH LOVE TO GOD IS DISPLAYED.

I shall now offer a remark or two on the nature of this sublime affection, and the manner in which it ought to be manifested. Love to God is not a single and solitary affection in the human breast, which evaporates in a few transient and undefined emotions; but is the spring of every holy activity, and is intimately connected with every virtuous emotion, with every pious sentiment, with every religious requirement, with every sensitive enjoyment, with our present comforts, and our future and eternal prospects.

It includes in it, *complacency, or delight in the character and administration of God*. Viewing him as a self-existent and eternal Being,—filling immensity with his presence, launching innumerable worlds into existence, upholding them all by the “word of his power,” and superintending the minutest concerns of all his offspring, from the loftiest seraph, through all the inferior gradations of existence, to the smallest animalcula,—the mind feels the most delightful emotions, in regarding the happiness of the universe as *perfectly secure* under his physical and moral administration. Contemplating his bounty to angels and to men, to the birds of the air, the fishes of the sea, and the numerous tribes which traverse the surface of the land,—his mercy towards our fallen race,—his long-suffering and forbearance towards wicked nations and individuals,—his faithfulness in the accomplishment of his promises and threatenings,—and the unerring rectitude of his dispensations towards all his creatures,—the mind feels supreme approbation and complacency in his attributes, purposes, and administrations; beholding in his character an excellence and amiableness, a moral dignity and grandeur which is not to be found in any created intelligence. Even in reference to those acts of his government which appear dreadful and appalling—in the volcano, the earthquake, the thunders, the hurricane, the tempest,

and the doom of the impenitent, its approbation and complacency are not withheld, convinced that perfect rectitude is the rule of his procedure, and that his righteousness will one day be brought to light before an assembled world.

Love to God includes *admiration of his wonderful works*. The man whose affections are directed to the Supreme Intelligence is not an indifferent spectator of the manifestations of Deity. He beholds the magnificent canopy of heaven daily moving around him in silent grandeur; his eye penetrates beyond the apparent aspects of the twinkling luminaries which adorn it, and surveys the hand of the Almighty wheeling stupendous globes through the immeasurable regions of space, and extending his operations throughout unnumbered systems, dispersed over the boundless expanse of the universe. He beholds the great globe on which he is placed, impelled by the same omnipotent arm, prosecuting its course through the depths of space, and circling around the sun, to bring about the revolutions of the seasons. He contemplates the vast ranges of mountains that stretch around it—the mass of waters in the mighty ocean, and its numerous tribes of animated beings—the “dry land,” with all its furniture and inhabitants—the vast caverns, chasms, and shattered strata, which appear in its interior recesses—and the atmosphere with which it is surrounded, with the clouds, the lightnings, and the tempests which diversify its aspect. He traces the footsteps of the Almighty in his moral administration—in the deluge which swept away the inhabitants of the antediluvian world—in the burning of Sodom, the dividing of the Red sea, the thunders and lightnings of Sinai—the manifestation of the Son of God in human flesh; his sufferings, death, resurrection, and triumphant ascension—in the propagation of the gospel in the face of every opposition, in the rise and fall of empires, the dethronement of kings, the battles of warriors, and the convulsions of nations. And, while he contemplates such objects and operations, his *admiration* is excited by the incomprehensible knowledge displayed in the contrivance of the universe, the boundless benevolence which extends over all these works, and the omnipotent power by which all the mighty movements of Creation and Providence are effected. And, while he admires, he is filled with strong emotions of *reverence* of the glorious perfections of that Being, whose mighty hand conducts those stupendous movements, and he feels the full force of the impressive exhortation of the psalmist, “Let all the earth fear the Lord; let all the inhabitants of the world stand in awe of him: for he spake, and it was done; he commanded, and it stood fast.” Even the abstract conceptions we have of the immensity of the Divine Being, by which he is present in every part of infinite space—the eternity of his

duration, and the range of his omniscience which embraces an intimate knowledge of the thoughts, the purposes, and the actions of all creatures; are calculated to overpower the mind with emotions of veneration and awe, blended with feelings of affection and delight at the recollection of the relation in which we stand to this glorious Intelligence.

Again, Love to God includes *Humility* and self-abasement in the divine presence. There is no disposition which appears more incompatible with supreme affection for the Creator than pride, haughtiness, and arrogance. "God resisteth the proud." Even "a proud look" is declared to be an "abomination" in his sight. And, if the indulgence of pride be inconsistent with the love of God, humility must be regarded as one of its essential and distinguishing accompaniments. When a man who loves God reflects on his *condition and character*—that he is a creature who derived his existence from a superior Being, to whom he is indebted for all his powers and faculties, and by whose power and mercy he is every moment preserved in existence; when he considers his *station in the universe*—that he is only like an atom in the immensity of creation, when compared with the innumerable beings which people its wide domains—that he stands near the lowest part of the scale of intelligent existence, and that "all the inhabitants of the earth are as grasshoppers" before Him who sits on the throne of the heavens; when he recollects that he has apostatized from the God who made him, that he is guilty of innumerable violations of his righteous laws, and stands condemned at the bar of Him "who is of purer eyes than to behold iniquity;" when he contemplates the circumstances in which he is now placed in consequence of his transgressions—the pains, diseases, poverty, bereavements, and reproaches, to which he is subjected; the storms, and tempests, and elemental war to which he is exposed; the degradation which awaits his body at the hour of dissolution and in the mansions of the tomb; and the ignorance, the errors, and follies into which he has fallen;—when he considers that "lowliness of mind" is a characteristic of the most exalted of created intelligences, who "veil their faces" in the divine presence, and cheerfully extend their benevolent regards to the meanest human being who is an "heir of salvation;" and, above all, when he reflects on the ineffable grandeur of that Being before whom "all nations are as the drop of a bucket," he is convinced that pride is the most unreasonable principle that can exist in the human breast, and that the most profound *humility* ought for ever to characterize his thoughts and actions, both in the presence of God, and before the eyes of men. On such a character only will "the High and Lofty One who inhabits eternity," look with complacency, and in such a heart alone

can the love of God be expected to reside in all its generous and noble exercises. Such a disposition, mingling with all the other benevolent affections, will render them sweet and delightful: it will render us amiable in the eyes of our fellow-men; it will secure us against all the wretched effects and boisterous passions which flow from haughtiness and pride; it will mitigate the sorrows, the perplexities, and anxieties to which we are subjected in our earthly pilgrimage; it will enable us to preserve our minds tranquil and serene amidst the provocations, the affronts, and the contentions to which we are exposed in our intercourses with general society, and will prepare us for associating with the inhabitants of that happier world, where seraphic love, profound reverence of the Divine Majesty, and profound humility, mingle with all their intercourses and employments.

*Resignation* to the providential dispensations of the Almighty is another manifestation and accompaniment of love to God. To be habitually discontented, and to murmur and repine under the allotments of his providence, must obviously appear to be inconsistent with sincere and ardent affection for the Supreme Disposer of events.—Resignation to the will of God is the duty of every intelligent creature towards the Creator; and in proportion to the degree in which this principle exists, will be the happiness of the intellectual being that exercises it. Angels are perfectly happy, because they are perfectly submissive to the will of their Creator—being fully contented with the station allotted them in the universe, and completely resigned to all the future services and allotments which Infinite Wisdom has ordained. Wherever pure affection towards God actuates the mind among the inhabitants of our world, it produces a disposition similar in kind, though inferior in degree, to that which animates the breasts of the cherubim and the seraphim in the regions of bliss.

He, who is actuated by this noble principle; regards every providential event as the appointment of his Father in heaven. The devouring flames may consume his habitation to ashes, and scatter his treasures to "the four winds of heaven;" the ship in which his wealth is embarked may be dashed against the rocks, and sink "as lead in the mighty waters;" his friends may forsake him in the season of his deepest anxiety and distress; the wife of his bosom, whom he tenderly loved, may be snatched from his embrace by the cold hand of death; his children, dearer to him than his own soul, may fall victims, one after another, to some pestilential disease, and be for ever removed from his sight to the "land of deep forgetfulness;" his familiar friend in whom he trusted may "lift up his heel against him," and load him with unmerited reproaches, his own body may be chastened with sore pain and loathsome disease; a fall from a horse may

break the bones of his leg, and render him lame for life; a random blow may bruise his eye-balls, and deprive him of all the entertainments of vision; he may be stretched for many long years on the bed of languishing; his country may either be ravaged and laid waste by destroying armies, or rains and inundations may sweep away the produce of his fields. But under all such calamities, he bows with submission to the will of Him "who rules in the whirlwind and directs the storm;" not because he has fortified his mind with a stoical apathy and indifference towards the evils of life; not because he is incapable of feeling the evils he is doomed to suffer; for he may feel them in the acutest degree, even while he exercises full resignation; but he is resigned, because he feels assured that they are the appointment of his Almighty Friend—that they are parts of the plan of unerring wisdom—that they are intimately connected with the whole chain of providence that runs through his present existence—that they are intended, in the scheme of infinite benevolence, to promote his happiness in a way which his limited faculties are unable at present to comprehend—and that they have a bearing on the scenes and enjoyments of the eternal world. And therefore, under the pressure of his most painful feelings, he is enabled to adopt the triumphant language of the prophet, "Although the fig-tree shall not blossom, neither fruit be in the vine; the labour of the olive fail, and the fields yield no meat; the flock be cut off from the fold, and there be no herd in the stall; yet will I rejoice in the Lord, I will be glad in the God of my salvation." While others murmur and rage, and toss themselves like a wild bull in a net, and curse the supposed authors of their calamities, he is enabled to "possess his soul in patience," convinced of the rectitude of the divine dispensations; and thus displays a nobleness of mind, and a heroism which is "above all Greek, above all Roman fame."

Again, Love to God comprehends *Gratitude* for the benefits he bestows. Gratitude is that particular modification of love which flows out towards God, considered as the Author and Bestower of all felicity: it is love excited by kindness communicated from benevolent motives. It is one of the most natural and obvious manifestations of that general principle which I have been hitherto illustrating; for ingratitude is altogether inconsistent with love to a benefactor. In order to kindle this amiable affection into a lively flame, the person in whose bosom it glows endeavours to take a minute and expansive survey of the "loving-kindness of God," and of the countless variety of benefits he is continually receiving. He feels grateful to God for his existence, for the powers and capacities with which he is endowed, for the rank which he holds in the scale of terrestrial existence; in being raised above the clouds of the valley, and furnished with faculties

superior to the beasts of the forest and the fowls of heaven. He feels grateful that he was brought into existence in a Christian land, and in civilized society; that the "glad tidings of salvation" have reached his ears; that "God so loved the world, that He gave his only begotten Son, that whosoever believeth on him might not perish, but have everlasting life," and that every enjoyment requisite for his present and future happiness is secured through this plan of divine benevolence. But he does not rest satisfied with vague and general views of these important benefits; he contemplates the degradation into which sin had plunged him, the greatness of the misery from which the love of God has delivered him, the moral perfection of his nature to which he is now training, the serenity of mind he experiences in the practice of the divine precepts, the security he feels for his present and future safety under the protection of Omnipotence, the "strong consolation" under the evils of life which the promises of God lead him to expect, the victory over death of which he is secured "through Christ Jesus his Lord," the resurrection of his body at the close of time, the "new heavens and the new earth" to which he is destined at the dissolution of this sublunary system, the alliance into which he is brought to the angelic tribes and other pure intelligences, his moral capacity for associating with every holy being in the universe, and the endless succession of transporting scenes which will burst upon his view through the ages of eternity. While contemplating these high privileges, in all their bearings and varied ramifications, emotions of affection and gratitude arise in his breast which can only be expressed in the language of elevated devotion.

"O How shall words with equal warmth  
The gratitude declare  
That glows within my ravish'd heart!  
But Thou canst read it there."

"Bless the Lord, O my soul! and all that is within me bless his holy name. Give thanks to the Lord, and forget not all his benefits; who forgiveth all thine iniquities, who healeth all thy diseases; who redeemeth thy life from destruction, and crowneth thee with loving-kindness and tender mercies."

Nor does he feel less grateful to God for his kindness as displayed in the material world, and in the ordinary course of his providence. He feels grateful for these scenes of sublimity and beauty with which the visible universe is adorned—for the sun when he ascends the vault of heaven, and diffuses his radiance over the mountains and the vales—for the moon, when she "walks in brightness" through the heavens, and cheers the shades of night—for the planets, while they run their ample rounds, and evince, by their magnitude and motions, the eternal omnipotence of their Maker—for the innumera-

the host of stars, which unite their splendours to adorn the canopy of the sky, and display the riches, and grandeur, and boundless extent of God's universal kingdom—for the light, which darts with unconceivable rapidity from the celestial luminaries, and diffuses a thousand shades of colour on the terrestrial landscape—for the surrounding atmosphere, which supports the element of fire, conveys the clouds over every region, and sustains and invigorates the functions of animal life—for the variety of beautiful and majestic scenery which diversifies our terrestrial system—for the towering cliffs, the lofty mountains, and the extensive vales—for the meandering river, gliding through the fields, and diffusing health and fertility wherever it flows—for the riches which abound in the gardens, the forests, and the fields, and the mineral treasures contained in the bowels of the mountains—for the harmony of musical sounds, the mellifluous notes of the nightingale and the lark, and the melodious warblings which resound from the vales, the mountains, and the groves—for the flowers which enamel the meadows, the trees, the shrubs, and the waving grain which adorn the earth with picturesque beauty—for the animated beings which contribute to our comfort, the bee which collects for us honey from every opening flower, the sheep which yields its fleeces for our clothing, and thousands of other creatures which contribute to supply us with food, raiment, furniture, and innumerable enjoyments. In all these, and similar objects, he perceives ample reasons for elevating his soul in lively gratitude to his bountiful Benefactor.

When he turns his eyes upon himself, and considers the wonderful machinery which gives life and motion to his frame, he perceives the strongest reason for the exercise of incessant admiration and gratitude. He feels grateful for every joint of his fingers, and for every movement of his wrist, by which he is enabled with the utmost ease to perform a countless variety of manual operations essential to his comfort—for the hundreds of bones which support his animal system, with their various articulations, and the hundreds of muscles and tendons which are interwoven with every part of the machine, which enable it to perform without the least obstruction, a thousand varied movements subservient to his health, convenience, and pleasure. He cannot walk through his apartment, nor lift his eyes to the heavens, nor move a joint of his finger, nor draw a single breath, without perceiving an evidence of the wisdom and intelligence of his Almighty Maker. He perceives, that if only one joint were wanting, or one muscle out of action, or one movement out of a thousand interrupted, he would instantly be subjected to a thousand painful sensations which would throw a gloom on every earthly enjoyment. But especially, when he reflects on the wonders

of vision—the thousands of millions of rays that are every moment darting from the objects around him, crossing each other in an infinity of directions, and yet conveying to every eye a distinct perception of their colours, motions, and diversified aspects; when he reflects on the facility with which he can turn his eye in every direction, upwards and downwards, to the right hand and to the left, and in a moment take in the landscape of the earth and the heavens “at a small inlet which a grain might close;” when he considers the numerous and complicated movements continually going on within him—the heart, like a powerful engine in perpetual motion, impelling, with prodigious force, streams of blood through a thousand different tubes—the numerous lacteal and lymphatic vessels absorbing nutriment from the food, and conveying it through every part of this wonderful machine. when he considers that these incessant motions are, as it were, the immediate hand of the Divinity within him, over which he can exercise no control, and which are all intended to preserve his existence and minister to his enjoyment,—he cannot forbear exclaiming, in the language of grateful admiration, “How precious are thy wonderful contrivances concerning me, O God! how great is the sum of them! If I should count them, they are more in number than the sand. I will praise thee, for I am fearfully and wonderfully made!”

He does not overlook such instances of “the loving-kindness of God,” because, to some, they may appear minute and trivial. He does not contrast them with what are reckoned spiritual and more important blessings; nor attempt to institute comparisons between the beneficent operations of Omnipotence, in order to throw a certain portion of them into the shade. He considers all the operations of God from the plan of redemption for guilty men, and the mission of his Son into our world, to the minutest muscle that moves the joint of a finger, or the ray of light that darts from a flower of the field, as parts of one vast system of boundless benevolence, as essentially connected together as the links of a chain; and, in regard to himself, he views all the variety of blessings now alluded to, as one undivided stream of unbounded beneficence, commencing with the first moment of his existence, running through all the scenes and circumstances of his terrestrial existence, and expanding into the unfathomable ocean of eternity. In the whole series of contrivances and events which relate to his present and future existence, both in what we consider the minutest and the most magnificent works of the Deity, he perceives the stamp of *infinite perfection*, and a connexion of plan and of operation, which excludes all attempts at comparisons and contrasts. Under such impressions, and with such views of the concatenation of every

part of the scheme of divine benevolence, he is led to contemplate the kindness of God at every step, and in every object, and is ever ready to exclaim, "What shall I render to the Lord for all his benefits toward me?"

In fine, supreme love to God includes in its exercise, a delight in the public and private exercises of his worship, a constant endeavour to yield a willing and unreserved obedience to all the institutions he has appointed, and to all the laws he has issued forth for counteracting the depravity of our natures, and for raising us to a state of moral perfection; an active and enlightened zeal for the honour of his name, and for promoting those institutions which have a tendency to advance his kingdom in the earth; a sincere and disinterested affection to all our fellow-men, and particularly to every class of holy intelligences; a cordial approbation of all his plans and movements in creation and providence; and devout aspirations after that higher state of existence, where the glories of his nature and "the kindness of his love" shall be more clearly unfolded, and where love shall glow in one uninterrupted and perpetual emotion.

Thus, it appears that love to God consists in complacency in his character and administration, and is inseparably connected with admiration of his wonderful works, with humility, resignation, and gratitude.

I cannot conclude my remarks on this topic without adverting, for a little, to the nobleness and sublimity of this first and fundamental spring of all moral action. From what has been already stated, it appears that love to God is the most reasonable and amiable affection that can animate the human mind; for that Being who is the object of it is the sum of all perfection, the standard of all moral and physical excellence, and the source of all the felicity enjoyed by every rank of existence throughout the boundless universe. It is also the most *sublime and expansive affection* that can pervade the mind of any created intelligence. It excites the most rapturous emotions when we contemplate the harmonies, the beauties, and the sublimities of the universe; for it recognizes them as the displays of boundless wisdom and boundless goodness; as the production of that Almighty Being who stands in the relation of our *Father* and our *Friend*; and leads us to conclude, that that power and intelligence which gave birth to all that is grand and beautiful in heaven and on earth, will be for ever exercised in contributing to our eternal enjoyment. Without such a recognition, creation appears only like an immense desert, and is apt to fill the mind with apprehension and terror; for it can feel no pleasurable emotions in contemplating the operations of a Being for whom it entertains no affectionate regard. But, in our solitary walks in the fields and the gardens, amidst the emanations of divine munificence;

in our journeys through the fertile plains; in our excursions through the Alpine scenes of nature; in our investigations into the structure of the animal and vegetable tribes; and in our contemplations on the wonders of the starry sky—love throws a radiance on all these objects, and excites an interest which cannot be appreciated by that mind which has never felt the force of this sacred emotion.

It renders us superior to the ills of life, while, under its influence, we bow, in cordial submission, to the divine dispensations, as the result of perfect wisdom, rectitude, and benevolence. It enables us to recognize the hand of a Divine Benefactor in every enjoyment, and the rod of an affectionate Father, in every trial and affliction to which we are subjected. It raises the soul above the carking cares and degrading pursuits of the world, and enables it to look down with heroic indifference on all those trivial incidents and fancied insults which irritate, and inflame, and torment "the children of pride." It preserves the mind in calm serenity amidst the raging of the tempest, the rolling thunders, the whirlwind, and the hurricane, the eruptions of the volcano, and the convulsions of the earthquake; while it recognizes the Ruler of the storm, who presides amidst the crash of warring elements, as its omnipotent Protector and its eternal refuge.\* It enables the man in whose bosom it resides, to contemplate with composure the downfall of kings and the revolutions of nations, to anticipate the hour of his dissolution without dismay, and to look forward with fortitude to the ruins of dissolving nature, when "the elements shall melt with fervent heat," and the earth, with all its magnificence, shall be wrapt in flames; confident that, under "the shadow of the wings of the Almighty," he shall remain in perfect security, amidst "the wreck of matter and the crush of worlds."

This divine principle assimilates us to angels, and to every other class of holy intelligences. It renders us qualified for associating with these superior intellectual natures—for entering into their vast and comprehensive views—for conversing with them on the sublime topics which occupy their attention—for bearing a part in their extensive schemes of universal benevo-

\* The celebrated *Kircher*, in his relation of the dreadful earthquake in Calabria, in 1638, which overthrew the city of Euphemia, of which he was a spectator, expresses his feelings on that occasion in the following words:—"The universal ruin around me, the crash of falling houses, the tottering of towers, and the groans of the dying, all contributed to raise terror and despair. On every side of me, I saw nothing but a scene of ruin and danger threatening wherever I should fly. I commended myself to God, as my last great refuge. At that hour, O how vain was every sublunary happiness. wealth, honour, empire, wisdom, all mere useless sounds, and as empty as the bubbles of the deep. Just standing on the threshold of eternity, nothing but God was my pleasure; and the nearer I approached, I only loved him the more."

lence—and for contributing, along with them, to the order and prosperity of God's everlasting kingdom. It secures to us the friendship and affection of all the virtuous inhabitants of the universe, and renders us fit for affectionate intercourse with them, wherever we may afterwards exist, throughout the boundless expanse of creation. Should we ever be permitted, during the lapse of eternal duration, to wing our flight from world to world, in order to enlarge our views of God's unbounded empire, the exercise of this holy affection would secure to us a friendly reception and an affectionate intercourse among all the pure intelligences within the range of his moral administration: for, as this principle is founded on the nature of God, who is eternal and unchangeable, it must pervade the minds of the inhabitants of all worlds that have retained their primitive integrity. It is this divine affection which excites the rapturous flame that glows in the breasts of the angelic tribes, which enlivens the songs and the adorations of the cheruim and the seraphim, which inspires them with a noble ardour in executing the commands of their Creator, and which animates them in their flight from the celestial regions to this obscure corner of creation, when they minister to the heirs of salvation. It was this noble principle which impelled the angel Gabriel in his rapid flight through the celestial spaces, when he descended to announce to Daniel the answer to his supplications, and to Zacharias and Mary the birth of the Saviour; which animated the angels who unbarred the prison doors to Peter, and gave assurance to Paul of the divine protection, while he was tossing on the tempestuous billows of the Adriatic sea; and which fanned the flame of devotion in the heavenly host, when they sung, in the plains of Bethlehem, "Glory to God in the highest, peace on earth, and good will towards men."

In fine, this sublime affection assimilates us to God, who is benevolence itself, who supremely loves his own character, and who is incessantly displaying his benevolence, in all its infinitely diversified effects, throughout the intelligent universe. It assimilates us to Jesus the Son of the Highest, who is "the brightness of the Father's glory, and the express image of his person," and who is for ever actuated with fervent zeal for the honour of God, and for the happiness of man. It constitutes the foundation of all felicity; it opens the gates to perpetual enjoyment; it secures its possessor of eternal happiness, as its *natural and necessary result*, and prepares him for mingling in the employments of the "innumerable company of angels and the spirits of just men made perfect:" for all the transporting scenes of glory, and all the avenues to felicity, which will be opened to the immortal spirit, while ages, numerous as the sand, are rolling on,

while mighty worlds are emerging out of nothing, and innumerable orders of beings are starting into existence, may be considered as so many infinitely diversified streams flowing from supreme affection to the blessed God, as the spring of every rapturous enjoyment. Possessed of this divine principle, we secure the most honourable connexions, become benefactors to the intelligent universe, participators of the enjoyments of seraphic natures, agents for carrying forward the plans of Infinite Benevolence, and "workers together with God," in accomplishing his eternal designs. Without it, we become nuisances in the kingdom of God, rebels against his government, pests to fellow intelligences, destitute of the noblest of all affections, deprived of substantial enjoyment in the present world, and exposed to misery, without interruption, in the world to come.

If such be the native effects of supreme love to God, and if this principle lie at the foundation of all genuine morality, how foolish and preposterous is it for Christian moralists to wander through the dark labyrinths of Greek and Roman literature, and the intricate mazes of modern skeptical philosophy, in search of any other principles of moral action? It is like groping for the light of the sun in the windings of a subterraneous grotto, and preferring the glimmering of a taper to the full blaze of the orb of day. It is, to forsake "the fountain of living waters, and to hew out to themselves broken and empty cisterns, that can hold no water."

In order to invigorate and expand this affection in the mind, it is requisite that we take a comprehensive view of all the manifestations of that Being towards whom it is directed, as exhibited in the history of his operations recorded in the volume of inspiration; in the details of his moral government among the nations, both in ancient and in modern times, which may be collected from the writings of historians, voyagers, travellers, and missionaries; in the economy of the inferior tribes of animated beings; in the diversified scenery of nature around us in our terrestrial system; and in the sublime movements that are going forward, among distant worlds, in the firmament of his power; for, the more we know of the manifestations of the Creator, the more acquaintance shall we have of the Creator himself; and, in proportion as our knowledge of his character is enlarged, in a similar proportion will our love be ardent and expansive. Such extensive views and contemplations are indispensably requisite, in order to a full recognition of the divine injunction "*Thou shalt love the Lord thy God with all thy heart, and with all thy strength, and with all thine understanding.*" This is the first and the great commandment.

## CHAPTER II.

### SECOND PRINCIPLE OF MORAL ACTION—LOVE TO ALL SUBORDINATE INTELLIGENCES.

IN the commencement of the last chapter, I had occasion to remark that, strictly speaking, the fundamental principle or affection which gives birth to all the ramifications of moral action, is but one, namely, *Love*. This noble affection may be considered as dividing itself into two great streams, one directing its course towards the Creator, as the supreme source of all felicity, and the other expanding itself towards all the intellectual beings which he has formed.

Having, in the preceding pages, endeavoured to illustrate the foundation and the reasonableness of the principle of love to God, from a consideration of his perfections, character, and relations, and having described some of those kindred affections by which its existence in the minds of moral agents is manifested,—I shall now endeavour to exhibit the foundation, and the reasonableness, of that modification of love which is directed towards created intelligences, and which may be termed the *second principle of moral action—THOU SHALT LOVE THY NEIGHBOUR AS THYSELF*. Taking it for granted that this is the fundamental law prescribed by the Creator for regulating the conduct of intelligent beings towards each other—because the Supreme Lawgiver has proclaimed it as such in the revelation which he has given us of his will—I shall endeavour to exhibit the reasonableness and the beauty of this amiable principle—from the nature of man, and the relations in which all the individuals of the human race stand to each other—from the happiness which would flow from the uniform operation of this principle—and from the misery which would inevitably ensue were it completely eradicated from the minds of moral agents.

Before proceeding to the illustration of these particulars, it may be proper to remark, that by "*our neighbour*" is to be understood *men of every nation and of every clime, whether they avow themselves as our friends or our enemies, and whatever may be their language, their religion, their rank, or station*. The inhabitants of New Zealand, of Patagonia, of New Holland, of the Ladrões, of Kamtschatka, or of Greenland, are our neighbours, in the sense intended in the divine injunction above quoted, as well as those who reside in our own nation and in our more immediate neighbourhood. For with all these, and other tribes of mankind, we may happen to

have intercourses, either directly or indirectly, and towards them all we ought to exercise an affection analogous to that which every man exercises towards himself. This we are decisively taught by our Saviour in the parable of the good Samaritan, in which it is clearly shown, that under the designation of *neighbour*, we are to include even our bitterest enemies. His apostles avowed the same sentiment, and taught, that in the bonds of Christian love, no distinction should exist between "*Jews and Greeks, Barbarians, Scythians, bond, or free*." For they are all members of the great family of God, and recognized as children by the universal parent.

---

### SECTION I.

#### THE NATURAL EQUALITY OF MANKIND CONSIDERED AS THE BASIS OF LOVE TO OUR NEIGHBOUR.

I SHALL now exhibit a few considerations founded on the Natural Equality of Mankind, in order to evince the reasonableness and the necessity of the operation of the principle of love towards all our fellow-men.

In the first place, Men, of whatever rank, kindred, or tribe, are the offspring of the great Parent of the universe. They were all created by the same Almighty Being, and to him they are indebted for all the members and functions of their animal frames, and for those powers, capacities, and endowments, which render them superior to the clods of the valley and to the beasts of the forest. They derived their origin too, as to their bodies, from the same physical principles and from the same earthly parent. "*Of the dust of the ground*" the body of the first man was formed; and from Adam, the primogenitor of the human race, have descended all the generations of men which now exist, or will hereafter exist till the close of time. This is equally true of the prince and of his subjects; of the monarch arrayed in purple, and seated on a throne, and of the beggar, who is clothed in rags, and embraces a dunghill; of the proud nobleman, who boasts of a long line of illustrious ancestors, and of the obscure peasant, whose progenitors were unnoticed and unknown. All derived their origin from

the dust, and all return to the dust again. This consideration, on which it is unnecessary to dwell, shows the reasonableness of union and affection among men, on the same grounds from which we conclude that brothers and sisters belonging to the same family ought to manifest a friendly affection for each other.

Secondly, Men of all nations and ranks are equal in respect to the mechanism of their bodies and the mental faculties with which they are endowed. Whether their bodies be rudely covered with the skins of beasts, or adorned with the splendours of royalty; whether they be exposed naked to the scorching heats and piercing colds, or arrayed in robes of silk and crimson—in their construction and symmetry they equally bear the impress of infinite wisdom and omnipotence. The body of the meanest peasant, who earns his scanty subsistence from day to day by the sweat of his brow, is equally admirable, in the motions of its fingers, the structure of its limbs, and the connexion and uses of its several functions, as the body of the mightiest and the proudest baron who looks down upon him with contempt. The organs of vision comprise as many coats and humours, muscular fibres, and lymphatic ducts, and form as delicate pictures upon the retina—the bones are equally numerous, and as accurately articulated—the muscles perform their functions with as great precision and facility—the lymphatic and absorbent vessels are as numerous and incessant in their operations—and the heart impels the blood through a thousand veins and arteries with as great a degree of rapidity and of purity in the corporeal frame of a poor African slave, who is daily smarting under the lash of an unfeeling planter, as in the body of the Emperor of China, who sways his sceptre over half the inhabitants of the globe. All the external trappings which fascinate the vulgar eye, and by which the various ranks of mankind are distinguished, are merely adventitious, and have no necessary connexion with the intrinsic dignity of man. They are part of the consequences of the depravity of our species: in most instances they are the results of vanity, folly, pride, and frivolity; and they constitute no essential distinction between man and man; for a few paltry guineas would suffice to deck the son of a peasant with all the ornaments of a peer.

Men are also nearly on a level in respect to the mental faculties which they possess. Every man, however low his station in the present world, is endowed with a spiritual principle which he received by "the inspiration of the Almighty," which is superior to all the mechanism and modifications of matter, and by which he is allied to beings of a superior order. The faculties of consciousness, perception, memory, conception, imagination, judgment, reasoning, and moral feeling, are common to men of all casts and nations. The power of recollecting the past,

and of anticipating the future—of deducing conclusions from premises previously demonstrated—of representing to the mind objects and scenes which have long ceased to exist; of forming in the imagination new combinations of the objects of sense; of perceiving the qualities of moral actions, and distinguishing between right and wrong; of recognizing a supreme intelligent Agent in the movements of the universe, and of making perpetual advances in knowledge and felicity; faculties which distinguish man from all the other tribes which people the earth, air, or sea; are possessed by the dwarfish Laplander and the untutored peasant, as well as by the ruler of kingdoms, the enlightened statesman, and the man of science. It is true, indeed, that there is a mighty difference among men in the direction of these faculties, in the objects towards which they are directed, in the cultivation they have received, and in the degree of perfection to which they have attained. There are innumerable gradations in the improvement and the energies of intellect, from the narrow range of thought possessed by a Greenlander or an Esquimaux, to the sublime and expansive views of a *Bacon*, or a *Newton*. But, this difference depends more on the physical and moral circumstances in which they are placed than on any intrinsic difference in the faculties themselves. Place the son of a boor or of a Laplander in circumstances favourable to the development of his mental powers, and afford him the requisite means for directing and increasing their activity, and he will display powers of intelligence equal to those which are found in the highest ranks of civilized life. A sound understanding, a correct judgment, vigour of mind, control over the irascible passions, and other mental endowments, though destitute of polish, will as frequently be found in the lower walks of life as in the elevated ranks of opulence and power.

The philosopher, however, as well as the man of rank, is apt to look down with a contemptuous sneer on the narrow conceptions of the husbandman, the mechanic, and the peasant; and is disposed to treat them as if they were an inferior species of intelligent beings. He does not always consider that the profound and the subtle speculations, which are dignified with the title of *philosophy*, are frequently of less importance to the progress of the human mind, and to the enjoyment of substantial comfort, than the deductions of common sense and the dictates of a sound though plain understanding; that they torment him with feelings, doubts, and perplexities, which sometimes shake the whole fabric of his knowledge, and lead him into labyrinths, out of which he can scarcely extricate his way; while the man of plain understanding, guided by a few certain and important points of truth, prosecutes the path of virtue with safety and success. For it may be considered as an established

maxim, that the most interesting and salutary truths connected with the happiness of man are neither numerous nor difficult to be acquired, and are level to the comprehension of men of every nation and of every rank. But however grovelling may be the affections, and however limited the intellectual views of the untutored ranks of society, *they are capable of being trained* to the knowledge and the practice of every thing which regards their present comfort and their future happiness; and to devise and execute the means by which this object may be accomplished, is one way among many others by which our love to mankind should be displayed and demonstrated. We have no reason to complain of the want of mental energy, or of the ignorance and folly of the lower orders of mankind, and to despise them on this account, while we sit still in criminal apathy, and refuse to apply those means which are requisite to raise them from their state of moral and intellectual degradation.

Thirdly, Mankind are on an equality, in respect of that moral depravity with which they are all infected. From whatever cause it may be conceived to have originated, the fact is certain, that a moral disease has spread itself through all the branches of the human family, in whatever station, or in whatever regions of the globe they may be placed. Whether we look back on the "generations of old," or survey the moral state of the nations in modern times; whether we turn our eyes to the abodes of savage or of civilized life; whether we contemplate the characters of the higher orders of society, or the practices which abound among the inferior ranks of social life; the stamp of depravity, in one shape or another, appears impressed upon the general conduct of mankind. In the case of *nations*, this depravity has manifested itself in those wars, dissensions, devastations, and contentions for territory and power, which have in all ages convulsed the human race and disturbed the peace of the world. Among lesser societies, families, and individuals, it is displayed in the operation of the principles of pride, ambition, tyranny, persecution, revenge, malice, envy, falsehood, deceit, covetousness, anger, and other malignant passions, which have infested all ranks and conditions of men. This depravity infects the higher ranks of mankind equally with the lower, though among the former it is sometimes varnished over with a fairer exterior; and therefore, there is no rank or order of men that have any valid reason on this ground for despising their fellow-creatures, or withholding from them the exercise of love and affection. For "there is none righteous, no, not one: for all have sinned, and come short of the glory of God." And in this point of view, love ought to exercise its beneficent energies, in endeavouring to counteract the stream of human corruption, and in disseminating those divine principles which are calcu-

lated to raise mankind to the moral dignity of their nature.

Fourthly, Mankind possess substantially the same pleasures and enjoyments. It is a trite saying, but it is nevertheless a true and important one, that happiness does not depend upon the rank and stations we occupy in life, nor upon the quantity of wealth or riches we possess. The pleasures which flow from the movements of the system of nature, and from the beauties which adorn the heavens and the earth, are common and open to all the inhabitants of the globe. The rising sun, the smiling day, the flowery landscape, the purling streams, the lofty mountains, the fertile vales, the verdure of the meadows, the ruddy hues of the evening clouds, the rainbow adorned with all the colours of light, the coruscations of the northern lights, the music of the groves, the songs of the nightingale and the lark, the breath of spring, the fruits of harvest, the azure sky, the blazing comet, the planets in their courses, the moon walking in brightness, and the radiant host of stars, convey to the mind thousands of delightful images and sensations, which charm the cottager and the mechanic no less than the sons of opulence and fame. The pleasures of the senses, of eating and drinking, of affectionate friendship, of social and domestic intercourse, of a cheerful contented mind, of fervent piety towards God, and of the hope of immortality beyond the grave, may be enjoyed by men of every colour, and rank, and condition in life; by the inhabitants of the cottage, as well as by the potentate who sways his sceptre over kingdoms. Nor does it materially detract from these enjoyments in the case of the peasant, that his body is frequently hung with rags, that he subsists on the coarsest fare, and reposes under the thatch of a miserable hut. For *habit* is the great leveller of mankind; it reconciles us to innumerable inconveniences and privations, and blunts the edge of the keenest pleasures. The owner of a princely mansion frequently loathes the most delicious dainties on his table, and walks through his magnificent apartments, surrounded with paintings and decorations, with as much apathy and indifference as if he were in an Indian wigwam or a clay-built cottage. So that, in the pleasures of sense, of affection, and sentiment, there is no essential distinction between the high and the low, the rich and the poor. But should it be insinuated that the poor and the ignoble have fewer enjoyments than the rich, then it will follow, that towards them in a particular manner our benevolent affections ought to be directed, in order that they may enjoy a competent portion of those physical and intellectual pleasures which the Creator has provided for all his creatures.

Fifthly, Men in every condition and in every clime have the same wants, and are exposed to the same disasters and afflictions. Hunger and

thirst, cold and heat, motion and rest, are common to all orders and conditions of men; and in order to supply and alleviate such wants, the aid of our fellow-men is indispensably requisite, to enable us to obtain food, raiment, light, warmth, comfortable accommodation, and shelter from the blasts of the tempest. We all stand in need of comfort and advice in the hour of difficulty and danger; we all long for the love, and friendship, and good offices of those around us; and we all thirst for an increase of knowledge, happiness, and joy. And those wants and desires can be supplied and gratified only by the kindly intercourse and affection of kindred spirits.

All are exposed to the same sorrows and afflictions. Disappointments, anxiety, disgrace, accidents, pain, sickness, disease, loss of health, fortune, and honour, bereavement of children, friends, and relatives, are equally the lot of the prince and the peasant. The prince in the cradle is a being as weak and feeble, as dependent on his nurse, has as many wants to be supplied, is liable to as many diseases and accidents, and requires as many exertions to learn to lisp, to speak, and to walk, as the new-born babe of his meanest subject. Nay, the rich and the powerful are frequently exposed to miseries and vexations from fancied insults, affronts, and provocations, from frustrated hopes, from pride, vanity, and ill-humour, from abortive projects and disconcerted plans, to which the poor are generally strangers. If we enter into one of the abodes of poverty, where one of the victims of disease is reclining, we may behold a poor emaciated mortal, with haggard looks and a heaving breast, reposing on a pillow of straw, surrounded by ragged children and an affectionate wife, all eager to sooth his sorrows and alleviate his distress. If we pass through a crowd of domestics and courtly attendants into the mansion of opulence, where disease or the harbinger of death has seized one of its victims, we may also behold a wretch, pale, blotched, and distorted, agonizing under the pain of the asthma, the gravel, or the gout, and trembling under the apprehensions of the solemnity of a future judgment, without one sincere friend to afford him a drop of consolation. Neither the splendour of his apartment, nor the costly crimson with which his couch is hung, nor the attentions of his physicians, nor the number of his attendants, can prevent the bitter taste of nauseous medicines, the intolerable pains, the misgivings of heart, and the pangs of conscience which he feels in common with the meanest wretch who is expiring on a dunghill.

Lastly, All ranks come to the same termination of their mortal existence. "Dust thou art, and unto dust thou shalt return," is a decree which has gone forth against every inhabitant of our globe, of whatever kindred, rank, or nation. The tombs of mighty princes, of intrepid gene-

rels, of illustrious statesmen, may be adorned with lofty columns, with sculptured marble, and flattering inscriptions; but within these varnished monuments their bodies present putrid carcasses, as loathsome, and as much the prey of worms and corruption, as the corpse of their meanest vassal. Their eyes are equally impenetrable to the light of day, their ears are equally deaf to the charms of music, and their tongues are equally silent in this land of deep forgetfulness. This consideration of itself fully demonstrates, if any demonstration be necessary, the *natural equality* of mankind, and that there is no essential difference between the noble and the ignoble, the emperor, and the slave. And since mankind are all equally liable to afflictions and distresses, and are all journeying to the tomb, nothing can be more reasonable than the exercise of love, with all its kindred affections, towards every class of our fellow-men, in order to alleviate their sorrows, and to cheer them on their passage through this region of mortality.

Thus it appears, that there is a natural equality subsisting among mankind, in respect of their origin, their corporeal organization, their intellectual powers, their moral depravity, their wants, their afflictions, their pleasures, and enjoyments, and the state to which they are reduced after they have finished the career of their mortal existence. The illustration of such circumstances would be quite unnecessary, were it not that a certain proportion of mankind, under the influence of pride and other malignant passions, are still disposed to look down on certain classes of their fellow-mortals as if they were a species of beings of an inferior order in the scale of existence. To the propriety of the sentiments now stated, the sacred Scriptures bear ample testimony. "The rich and the poor meet together; the Lord is the maker of them all."\* "Did not he that made me in the womb make my servant, and did he not fashion us alike?"† "God hath made of one blood all nations of men for to dwell on all the face of the earth, and hath determined the times before appointed, and the bounds of their habitation."‡

Since, therefore, it appears, that mankind are equal in every thing that is essential to the human character, this equality lays a broad foundation for the exercise of universal love towards men of all nations, tribes, conditions, and ranks. It must obviously appear contrary to every principle of reason, repugnant to every amiable feeling, and inconsistent with the general happiness of the species, that intelligent beings, who are all children of the same Almighty Parent, members of the same great family, and linked together by so many fraternal ties, should "bite and devour one another," engage in hostile enterprises against each other, look down with scorn and

\* Prov. xxii. 2. † Job xxxi. 15. ‡ Acts xvii. 26.

contempt on each other, or even behold with indifference the condition of the meanest member of the family to which they belong. On the other hand, it is consistent with the dictates of enlightened reason, congenial to the best feelings of human nature, and indispensably requisite to the promotion of universal happiness, that such beings should be united in the bonds of affection and harmony, that they should sympathize with the distressed, delight in beholding the happiness of all, "rejoice with them that do rejoice, and weep with them that weep;"—that every one, whether he be near or far off, whether he be rich or poor, whether he be learned or unlearned, whether he belong to this or the other civil or religious society, whether his colour be black or white, whether he be blind, or deaf, or lame, whether he be an inhabitant of Greenland, Iceland, Barbary, Germany, France, or Spain, whatever may be his language, manners, or customs, should be recognized, wherever he may be found, as a friend and brother; and a cordial interest felt in every thing that concerns his welfare and comfort. Such a recognition of man as man, is a duty which necessarily flows from the natural equality of mankind, and is congenial to the conduct of the Universal Parent towards all his human offspring. For, in his love to his numerous family, and without respect of persons, he makes the same vital air to give play to their lungs, the same sun to cheer and enlighten them, and the same rains and dews to refresh their fields, and to ripen the fruits of harvest.

Let it not, however, be inferred, from what has been now stated, that we mean to sap the foundations of that subordination of ranks which exists in this world. This gradation in society is the appointment of God, and necessarily flows from the circumstances and relations in which man is placed in this first stage of his existence; and, were it completely overthrown, society would be plunged into a scene of anarchy and confusion; and the greater part of the individuals which compose it, would become a lawless banditti. Whether or not there exists a subordination of office and rank among *superior* intelligences of the same species, or among the inhabitants of other globes, we are unable at present to determine; but in the actual condition of society in the world in which we dwell, a state of complete independence, and a perfect equality of wealth, station, and rank, are impossible, so long as there exists a diversity in the capacities, tempers, and pursuits of men. On the diversity of rank, and the relations which subsist between the different classes of society, as parents and children, masters and servants, princes and subjects, is founded a great proportion of those moral laws which God hath promulgated in his word, for regulating the inclinations and the conduct of mankind.

Diversity of fortune and station appears abso-

lutely inevitable in a world where moral evil exists, and where its inhabitants are exposed to dangers, difficulties, and distress. Whether the inhabitants of a world, where moral perfection reigns triumphant, can exist in a state of perfect felicity, and move forward in progressive improvement, without a subordination of rank, it is not for us to determine. But in such a world as ours, it is a wise and gracious appointment of the Creator, and is attended with many and important advantages. Were there no diversity of wealth and station, we should be deprived of many of the comforts, conveniences, and assistances which we now enjoy. Every one would be obliged to provide for himself food, drink, clothing, furniture, shelter, medicines, and recreations; and in the season of sickness, danger, and distress, he would have few or none to alleviate his affliction, and contribute to his comfort. But, in consequence of the diversity which now exists, an opportunity is afforded of employing the several capacities and endowments of mankind in those lines of active exertion, for which they are respectively fitted, and of rendering them subservient for the improvement and happiness of general society. One exercises the trade of a weaver, another that of a baker; one is a shoemaker, another a tailor; one is an architect, another a farmer; one is a teacher of science or religion; others have their minds entertained and improved by his instructions. One is appointed a ruler over a city, another over a kingdom; one is employed in writing for the amusement and instruction of mankind, another is employed in printing and publishing his writings. By this arrangement, the powers and capacities in which individuals excel, are gradually carried to the highest degree of attainable perfection; and the exertions of a single individual are rendered subservient to the ease, the convenience, and the mental improvement of thousands.

It is not to the diversity of rank and station, that the evils which exist among the various classes of society are to be attributed; but to the influence of a spirit of pride, on the one hand, and a spirit of insubordination on the other—to the want of a disposition to discharge the duties peculiar to each station, and to the deficiency of those kindly affections which ought to be manifested towards every human being, by men in all the ranks and departments of life. If love, in all its benevolent ramifications, were to pervade the various ranks of social life, kings would never oppress their subjects, nor masters act unjustly towards their servants; nor would subjects and servants refuse to submit to just laws, and equitable regulations. All would act their parts with harmony and delight in this great moral machine, and every station and rank would contribute, in its sphere, to the prosperity and happiness of another. For the poor cannot do without the

rich, nor the rich without the poor; the prince without his subjects, nor subjects without wise and enlightened rulers, and equitable laws. All are linked together by innumerable ties; and the recognition of these ties, and the practice of the reciprocal duties which arise out of them, form the source of individual happiness, and the bonds of social enjoyment.

## SECTION II.

### THE CONNEXIONS AND RELATIONS WHICH SUBSIST AMONG MANKIND CONSIDERED AS ESTABLISHING THE BASIS OF LOVE TO OUR NEIGHBOUR.

THE relations which subsist among mankind lay a foundation for the exercise of the benevolent affections, and for the various duties of social life; and these relations are far more numerous and extensive than the generality of mankind are disposed to admit. The relations of parents and children, of husbands and wives, of brethren and sisters, of masters and servants, of rulers and subjects, of teachers and scholars, of buyers and sellers, &c. are recognized by all as involving an obligation to the exercise of certain corresponding duties and affections. The moment we contemplate the relation of a parent and a child, we at once perceive the obligation of love on the part of the parent, and of reverence and obedience on the part of the child; and, in every other relation, a corresponding duty is involved, resulting from the nature of that relation, and founded on the principle of love. But as these relations, and their corresponding duties and affections have been frequently illustrated, I shall advert to a variety of circumstances, generally overlooked, which demonstrate the universal connexion of human beings with each other, and the reasonableness of the exercise of love towards all mankind.

Wherever we turn our eyes towards the great family of mankind—whether we look around on the land of our nativity, or to distant continents, and the oceans which surround them, we behold thousands of human beings toiling for our ease, our convenience, our pleasure, and improvement.—Here, we behold the ploughman turning up the furrows of the soil, and the sower casting in the seed which is to produce the fruits of harvest:—there, we behold the reaper cutting down the corn which is to serve for our nourishment. On the one hand, we behold the cow-herd tending his cattle, which are to afford us milk, butter, and cheese; on the other, we behold the shepherd tending his flocks, whose wool is to provide us with warm and comfortable clothing. One is preparing leather from the hides of oxen, another is shaping it into shoes and boots. One is spin-

ning flax and cotton into yarn, another is weaving it into linen and muslin, to cover and adorn us. One is dressing the vine, whose juice is to cheer and refresh us; another is treading the wine-press, and preparing the wine for our use. Here, we behold the blacksmith toiling and sweating at the anvil, preparing tongs, and shovels, and grates, for our apartments; there, we behold the carpenter, with his hammer, and plane, and saw, fitting up beds, and tables, and chairs, for our ease and accommodation. Here, one is preparing our food, and another our clothing; there, one is preparing our drink, and another our medicines. In one chamber, the student of nature and of science is preparing, at the midnight lamp, those compositions which are to convey entertainment and instruction to the minds of the public; in another, the herald of salvation is meditating on those divine subjects, which he is about to proclaim for the illumination and comfort of assembled multitudes. In short, to whatever department of human society we direct our attention, and to whatever quarter we turn our eyes, in the busy scene around us, we behold thousands of our fellow-men exerting their corporeal and intellectual powers in those employments which will ultimately contribute either to our ease, our entertainment, our security, our accommodation, our subsistence, or our moral and intellectual improvement.

But our connexions with human beings are not confined to our immediate neighbourhood, nor even to the nation in which we reside. There is scarcely a region of the globe towards which we can direct our view, in which we do not behold innumerable links which connect us with the great family of mankind. Let us turn our eyes to the West India islands, and we shall behold the poor African slave toiling under the scorching heat of a tropical sun, and smarting under the cruel lash of an unfeeling overseer, in order to provide for us sugar, molasses, and rice, to mingle with our dainties, and to regale our appetites. If we direct our view to the empire of China, on the opposite side of the globe, twelve thousand miles distant from the former region, we shall behold thousands and tens of thousands of our brethren of the human family busily employed in planting the tea tree, in plucking its leaves, in exposing them to the steam of boiling water, in spreading them out to dry, in assorting them into different parcels, in packing and shipping them off for distant shores, that we, at a distance of nine thousand miles, may enjoy a delicious beverage for our morning and evening meals.\* If we turn our eyes on India and Persia,

\* For a portion of this beverage we are indebted even to some of the monkey tribe. As the tea shrub often grows on the rugged banks of steep mountains, access to which is dangerous, and sometimes impracticable, the Chinese, in order to come at the leaves, make use of a singular stratagem. These

we shall find multitudes of men, women, and children assiduously employed in cultivating the mulberry plant, in hatching and rearing silkworms, in winding and twisting the delicate threads which proceed from these insects, and preparing them for the loom, in order that our ladies may be adorned with this finest production of nature and art. Let us pass in imagination to the frozen regions of Siberia and Kamtschatka, to the inhospitable shores of Onalaska and the Aleutian isles, and we shall behold numbers of weather-beaten wretches exposed to innumerable dangers by sea and land, traversing snowy mountains, forests, marches, and deserts, suffering frequent shipwrecks on the coasts of unknown islands inhabited by savage tribes, and exposed, night and day, to the chilling frosts of the polar region, and the attacks of ravenous wolves, in order to collect the skins of otters, and furs of various descriptions, to adorn the dress of our female friends, and to shelter them from the winter's cold. Let us pass to the forests of Norway, Sweden, Canada, and Jamaica, and hundreds of hardy, weather-beaten peasants, exposed to many accidents and privations, will be seen cutting down the tall firs, larches, and mahogany, sawing them into planks and logs, and conveying them in floats along rapid rivers towards the sea, to be shipped for our country, for the purpose of being formed into floors and roofs for our buildings, and into elegant furniture to decorate our apartments.

Not only in distant islands and continents, but even in the midst of the vast ocean, multitudes of our brethren are toiling for our pleasure, convenience, and comfort. See yonder vessel in the Southern Atlantic ocean, which has just weathered the storms on the southern cape of Africa, and narrowly escaped the dangers of shipwreck on a rocky shore. For several weeks the hardy mariners have been beating against the wind in the midst of thunders, lightnings, and tempests, with mountainous waves continually breaking over them, darkness surrounding them for many sleepless nights, and the dread of impending destruction filling them with trembling and horror. And why have they been exposed to danger so dreadful and appalling? That they might convey to our shores, from China and Hindostan, stores of tea, coffee, sugar, porcelain, silks, carpets, and precious stones, to supply luxuries to our tables, and ornaments to our dress. See yonder vessel, too, which is tossing in the midst of the Northern ocean, passing between shoals and icebergs, and liable every moment to be crushed to pieces between mountains of ice. Her mariners have long been

steep places are generally frequented by great numbers of monkeys, which, being irritated and provoked, to avenge themselves, tear off the branches, and shower them down upon those who have insulted them. The Chinese immediately collect these branches and strip off their leaves.—*Ency. Brit. Art. Tea.*

exposed to the rigours of an arctic sky, and have narrowly escaped being plunged into the deep by the stroke of an enormous whale, in order that we might be supplied with seal-skins, whale-bone, and oil for our lamps.

Even in the bowels of the ocean thousands of poor wretches, on the coasts of California, Ceylon, Persia, and China, are diving amidst its waves, remaining whole half hours, at sixty feet below the surface of its waters, exposed to the danger of being devoured by sharks and other monsters of the deep, in order to collect *pearls* for ornaments to the ladies of Europe, Asia, Africa, and America.—In short, wherever we turn our eyes on the surface of the mighty deep, we contemplate a busy scene of human beings ploughing the ocean in every direction, and toiling, in the midst of dangers, storms, and tempests, in order to promote the accommodation of their fellow-mortals, who dwell on opposite regions of the globe. On the one hand, we behold thousands of hardy Russians, Swedes, and Norwegians, steering their vessels along the Baltic and the German sea, to convey to our shores copper, timber, pitch, skins, hemp, and tallow; on the other, we behold the Americans ploughing the waves of the Atlantic, with stores of mahogany, sugar, rice, flour, tobacco, rum, and brandy. Along the vast Pacific ocean, the Spanish galleons are conveying to Europe, gold, silver, pearls, precious stones, and all the other riches of Peru. Even from the southern icy ocean, where nature appears bound in the fetters of eternal ice, the adventurous mariner is conveying to our shores furs of various kinds, with the products of seals and whales. And, in return for the supply we receive from foreign regions, our British sailors are traversing every sea and ocean, and distributing to the inhabitants of every clime the productions of our arts, sciences, and manufactures.

Even in the subterraneous apartments of the globe, as well as upon its surface, many thousands of human beings are labouring, in confined and gloomy regions, to promote our comforts and enjoyments. The copper mines in Sweden are situated at more than a thousand feet below the surface of the ground, and contain a vast number of subterraneous apartments, branching in all directions. In these dreary abodes, twelve hundred wretched beings are doomed to pass their existence, deprived of the cheerful light of day—toiling, almost naked, in the midst of hot and sulphureous vapours, and under severe task-masters, in order that we may be supplied with the best species of copper, for forming our kettles, cauldrons, and copper-plate engravings. The salt mines of Hungary and Poland, the gold and silver mines of Potosi and Peru, and hundreds of similar subterraneous mansions, in various parts of the earth, present to our view numerous groups of our fellow-men, all engaged

In similar toils and labours, in order that we may enjoy the riches, the elegancies, and the conveniences of life. In our own country, how many thousands of our brethren are labouring in the dark recesses of the earth, far beneath its surface, exposed to the suffocation of the *choke-damp* and the explosions of the *fire-damp*, in procuring for us that invaluable fossil, which warms and cheers our winter apartments, which cooks our victuals, and enables us to carry on the various processes of our arts and manufactures !

Thus it appears, that we are connected with our fellow-men, in every quarter of the world, by thousands of ties ;—that millions of human beings, whom we have never seen, nor never will see on this side the grave, are labouring to promote our interests, without whose exertions we should be deprived of the greatest proportion of our accommodations and enjoyments. While we are sitting in our comfortable apartments, feasting on the bounties of Providence, thousands, and ten thousands of our brethren of mankind, in different regions of the globe, are assiduously labouring to procure for us supplies for some future entertainment. One is sowing the seed, another gathering in the fruits of harvest ; one is providing fuel, and another furs and flannel, to guard us from the winter's cold ; one is conveying home the luxuries and necessities of life, another is bringing intelligence from our friends in distant lands ; one is carrying grain to the mill, another is grinding it, and another is conveying it along the road to our habitations ; one is in search of medicines to assuage our pains, and another is in search of consolation to sooth our wounded spirits. In the midst of these never-ceasing exertions, some are crossing deep and dangerous rivers, some are traversing a vast howling wilderness ; some are wandering amidst swampy moors, and trackless heaths ; some are parched with thirst in sandy deserts ; some are shivering and benumbed amidst the blasts of winter ; some are toiling along steep and dangerous roads, and others are tossing in the midst of the ocean, buffeted by the winds and raging billows.

And, since we are connected with our fellow-creatures by so many links, is it not reasonable, is it not congenial to the nature of man, that we should be connected with them by the ties of sympathy and benevolent affections ? It is true, indeed, that the various classes of mankind in every country, who are toiling for our ease and gratification, seldom or never think of us in the midst of their difficulties and labours. Perhaps they have no other end in view than to earn their daily subsistence, and provide food and clothing for their families ; perhaps they are actuated by the most selfish motives, and by principles of vanity and avarice ; and some of them, perhaps, under the influence of that depravity which is

common to the species, may be secretly cursing and reproaching us as individuals, or as a nation. But, from whatever motives their labours and exertions proceed, it is a fact which cannot be denied, and which they cannot prevent, that we actually enjoy the benefit of them ; and, that, without them, we should be deprived of the greater part of those comforts and enjoyments which render existence desirable, and which cheer us in our pilgrimage to the grave.

We have, therefore, in almost every artificial object that surrounds us, and in every enjoyment we possess from day to day, so many sensible emblems of our connexion with every branch of the great family of mankind. When we sit down to a dish of tea, we are reminded of the crowded and busy population of China, where this plant is produced, and of the poor African slave, through whose sorrows and toils the sugar we mix with it is prepared. And shall we not feel a kindly affection for those whose labours procure us such a refreshing beverage ? And should not our love prompt us to every active exertion by which their miseries may be alleviated, and their intellectual and religious improvement promoted ? When we look at the pearls which adorn us, we are reminded of the poor wretch who has plunged to the bottom of the deep, and scrambled among projecting rocks, to the danger of his life, in order to procure them. When we look at a copper-plate engraving, we are reminded of the dark and cheerless recesses of the copper mines, where hundreds are employed in digging for this useful metal. When we enjoy the comfort of a cheerful fire, we are reminded of the gloomy subterraneous regions to which so many of our countrymen are confined, and the toils and dangers to which they are exposed, before our coals can be dragged from the bowels of the earth. And while we feel delighted with the diversified enjoyment which flows from the labour and industry of every class of mankind, is it reasonable that we should look with indifference on any one of them ? Is it not accordant with the dictates of enlightened reason, and with every thing that we consider as amiable in the nature of man, that we should embrace them all in the arms of kindness and brotherly affection, and that our active powers, so far as our influence extends, should be employed in endeavouring to promote their present and everlasting happiness ? At present, they seldom think about the benefits they are procuring for us and others by their useful labours ; but were their circumstances meliorated, were their miseries relieved, were their minds expanded by instruction, were their moral powers cultivated and improved, were they to behold the various branches of the human family for whom they are labouring, exerting every nerve to promote their moral improvement and domestic enjoyment, it would produce many pleasing emotions in their breasts, in the midst of all their toilsome la-

hours, to reflect that their exertions are the means of distributing numerous comforts and conveniences among men of different nations, ranks, kindreds, and languages. Their minds would take a more extensive range among the various tribes of mankind with which they are connected, as intelligences of the same species; they would learn to trace the remotest consequences of every branch of labour, and of every mechanical operation in which they are engaged, and they would thus feel themselves more intimately related to every individual of the great family to which they belong.

That it is the intention of the Creator that an extensive and affectionate intercourse should be carried on between the remotest tribes of mankind, appears even from the physical constitution and arrangement of our globe. The surface of the earth is every where indented with rivers of various dimensions, winding in every direction through the continents and the larger islands, and some of them running a course of several thousands of miles. In the eastern continent, above four hundred rivers of large dimensions are rolling from the mountains towards the sea; and in the western continent, more than one hundred and forty majestic streams are to be found, connecting the highest and the remotest parts of the land with the ocean, besides thousands of streams of smaller dimensions. The water of the sea is formed of such a consistency, or specific gravity, that it is capable of supporting large floating edifices; while, at the same time, its parts are so yielding as to permit such vehicles to move with rapidity along its surface, through its waves and billows. In virtue of this arrangement, the ocean, instead of standing as an everlasting barrier between the nations, has become a medium for the most speedy intercourse between distant lands. The atmosphere which surrounds the globe, contributes likewise by its agency to promote the same important end. By the impulsion of its different masses in various directions, our ships are wafted with considerable velocity along the surface of rivers, seas, and oceans, to the remotest extremities of the globe. By means of these arrangements which the Creator has established, the treasures of the mountains, and of the inland parts of the continents and islands, are conveyed towards the sea, and transported from one island and continent to another; and thus the various tribes of mankind have an opportunity of visiting each other, of cultivating an affectionate intercourse, and of contributing to their mutual enjoyment. And as it is probable that there exist in nature certain powers or principles not yet discovered, the agency of which may be applied to the propelling of machines and vehicles over land and water, and through the regions of the atmosphere, with a velocity much superior to what has hitherto been effected;—it appears

evident, that the Creator, in forming such principles, and in permitting man to discover their nature and energies, intended that they should be applied for promoting a rapid and endearing intercourse among all the branches of that large family which he has placed upon the globe. And I have no doubt, that in the future ages of the world, by means of improvements in art and science, such intercourse will be carried on in the spirit of benevolence, to an extent and with a rapidity of which we cannot at present form any adequate conception.

It appears, then to be one great design of the Creator, in connecting mankind by so many links, and in rendering them dependent upon each other, though placed in opposite regions of the globe, to lay a broad foundation for the exercise of the benevolent affections between men of all nations, and ultimately to unite the whole human race in one harmonious and affectionate society. And it is obviously the duty of every human being to cultivate those dispositions, and to prosecute that train of action which have a tendency to accomplish the plans of the Universal Parent, and to promote the happiness of his intelligent offspring. In so doing, he contributes to his own individual happiness, and at the same time to that of all the moral intelligences in heaven and earth with which he is connected.

### SECTION III.

#### THE ULTIMATE DESTINATION OF MANKIND CONSIDERED AS A BASIS FOR LOVE TO OUR NEIGHBOUR, AND AS A MOTIVE TO ITS EXERCISE.

THE present world is not the ultimate destination of mankind. It is only a passing scene through which they are now travelling to that immortal existence which will have no termination. Man is at present in the infancy of his being; his faculties are only beginning to expand, his moral powers are feeble and depraved, his intellectual views are circumscribed within a narrow range, and all the relations in which he stands demonstrate that the present scene is connected with the future, and is introductory to a higher sphere of action and enjoyment. "We know," says the Apostle Paul, "that if this earthly house of our tabernacle were dissolved, we have a building of God, an house not made with hands, eternal in the heavens." And our Saviour declares, that "the hour is coming, in which all that are in their graves shall hear his voice, and shall come forth," and that "our vile bodies shall be changed, and fashioned like unto his glorious body," and shall enter into the enjoyment of a new world, "which is incorruptible, undefiled, and which fadeth not away."

The capacity of making perpetual advances in knowledge and moral improvement in a future state of existence, is that in which the true dignity of man consists; and in this capacity, and the high destination with which it is connected, there is no difference between the high and the low, the slave who is chained to a galley, and the sovereign at whose nod the nations tremble. They are equally destined to immortality, and will exist in a future world, when time and all the arrangements of the present state shall come to a close. If man were only the creature of a day, whose prospects are bounded by this terrestrial scene, and whose hopes terminate in the tomb, it might appear a matter of comparatively little importance whether or not our benevolent regards were extended to our fellow-men, except in so far as our self-interest and avarice were concerned. The happiness of a fellow-creature might then be considered as a matter of indifference, and his dissolution, at death, a circumstance as trivial as the falling of a leaf in autumn, or the sinking of a stone to the bottom of the ocean. Even in this case, however, it would still be conducive to human happiness during the short and uncertain span of our existence, that all the branches of the human family were cemented together in union and affection. But when we reflect that all the intelligent beings around us, with whom we more immediately associate, and all those in distant lands with whom we are connected by the ties of one common nature, and on whom we depend for many of our comforts, are destined along with ourselves to an eternal world, in another region of the Creator's empire; and that the affections we now cultivate, and the conduct we pursue in reference to our brethren, have an intimate relation to that immortal existence;—this consideration stamps an importance on the exercise of brotherly affection which is beyond the power of human language to express. It shows us, that the dispositions which we now indulge, and the manner in which we treat the meanest of our fellow-creatures, may be recognised and attended with the most important effects a thousand millions of years hence, and may run parallel in their consequences even with eternity itself.

We may, perhaps, view it as a matter of trivial moment in what manner we now conduct ourselves towards a servant or a slave; whether we render his life miserable by hard labour, cruel insults, and contemptuous treatment, or study to promote his comfort and domestic enjoyment; whether we neglect to instruct him in the knowledge of his duty to his God and to his fellow men, or labour to promote his moral and religious improvement. We may view with indifference or contempt the person and the family of a poor pious neighbour, who has earned a scanty subsistence by the sweat of his brow, and

may behold his body laid in the grave with as much apathy as we behold the carcass of a dog thrown into a pond. But could we follow the pious man beyond the precincts of the tomb, into that immortal scene which has burst upon his disencumbered spirit; could we trace the gradual expansion of his faculties towards objects which lie beyond the grasp of mortals, and the perfection of his moral powers; could we behold his mouldered frame starting up to new life at "the resurrection of the just," and arrayed in new splendour and beauty; could we contemplate him placed in a station of dignity and honour among the sons of God," in that glorious residence to which he is destined; his intellectual powers expanding, grasping the most sublime objects, and pushing forward in the career of perpetual improvement, without the least stain of moral imperfection;—would we now treat such a one with malevolence, or even with indifference or neglect? And were we placed by his side in such a dignified station, what would our feelings be when we recollected the apathy, the indifference, and even the contempt with which he was treated in this sublunary scene? On the other hand, could we follow the poor wretched slave to the future world, and contemplate the degradation and misery to which he is there reduced in consequence of our malevolence and neglect, what emotions of horror and indignation should we not feel at the recollection of that pride and disaffection which led us to act so basely towards a fellow-immortal, whom it was in our power to have trained to wisdom, to excellence, and to a happy immortality? When, therefore, we behold individuals withholding their benevolent regard from their brethren of mankind, and treating them with haughtiness and contempt, we must conclude that such persons overlook the true dignity of man, and secretly disbelieve the reality of an immortal state of existence, whatever professions they may make to the contrary. For the consideration of the eternal destiny of mankind reflects a dignity on the meanest human being, and attaches an importance to all our affections and actions in relation to him, unspeakably greater than if his existence were circumscribed within the narrow limits of time, and throws completely into the shade all the degrading circumstances with which he is now surrounded.

When we consider our brethren of the human family in the light of immortal intelligences, and look forward to the scenes of the eternal world, a crowd of interesting reflections naturally arises in the mind. A wide and unbounded prospect opens before us. Amidst new creations and the revolutions of systems and worlds, new displays of the Creator's power and providence burst upon the view. We behold ourselves placed on a theatre of action and enjoyment, and passing through "scenes and changes" which bear no resemblance to the transactions and events of

hours, to reflect that their exertions are the means of distributing numerous comforts and conveniences among men of different nations, ranks, kindreds, and languages. Their minds would take a more extensive range among the various tribes of mankind with which they are connected, as intelligences of the same species; they would learn to trace the remotest consequences of every branch of labour, and of every mechanical operation in which they are engaged, and they would thus feel themselves more intimately related to every individual of the great family to which they belong.

That it is the intention of the Creator that an extensive and affectionate intercourse should be carried on between the remotest tribes of mankind, appears even from the physical constitution and arrangement of our globe. The surface of the earth is every where indented with rivers of various dimensions, winding in every direction through the continents and the larger islands, and some of them running a course of several thousands of miles. In the eastern continent, above four hundred rivers of large dimensions are rolling from the mountains towards the sea; and in the western continent, more than one hundred and forty majestic streams are to be found, connecting the highest and the remotest parts of the land with the ocean, besides thousands of streams of smaller dimensions. The water of the sea is formed of such a consistency, or specific gravity, that it is capable of supporting large floating edifices; while, at the same time, its parts are so yielding as to permit such vehicles to move with rapidity along its surface, through its waves and billows. In virtue of this arrangement, the ocean, instead of standing as an everlasting barrier between the nations, has become a medium for the most speedy intercourse between distant lands. The atmosphere which surrounds the globe, contributes likewise by its agency to promote the same important end. By the impulsion of its different masses in various directions, our ships are wafted with considerable velocity along the surface of rivers, seas, and oceans, to the remotest extremities of the globe. By means of these arrangements which the Creator has established, the treasures of the mountains, and of the inland parts of the continents and islands, are conveyed towards the sea, and transported from one island and continent to another; and thus the various tribes of mankind have an opportunity of visiting each other, of cultivating an affectionate intercourse, and of contributing to their mutual enjoyment. And as it is probable that there exist in nature certain powers or principles not yet discovered, the agency of which may be applied to the propelling of machines and vehicles over land and water, and through the regions of the atmosphere, with a velocity much superior to what has hitherto been effected;—it appears

evident, that the Creator, in forming such principles, and in permitting man to discover their nature and energies, intended that they should be applied for promoting a rapid and endearing intercourse among all the branches of that large family which he has placed upon the globe. And I have no doubt, that in the future ages of the world, by means of improvements in art and science, such intercourse will be carried on in the spirit of benevolence, to an extent and with a rapidity of which we cannot at present form any adequate conception.

It appears, then to be one great design of the Creator, in connecting mankind by so many links, and in rendering them dependent upon each other, though placed in opposite regions of the globe, to lay a broad foundation for the exercise of the benevolent affections between men of all nations, and ultimately to unite the whole human race in one harmonious and affectionate society. And it is obviously the duty of every human being to cultivate those dispositions, and to prosecute that train of action which have a tendency to accomplish the plans of the Universal Parent, and to promote the happiness of his intelligent offspring. In so doing, he contributes to his own individual happiness, and at the same time to that of all the moral intelligences in heaven and earth with which he is connected.

### SECTION III.

#### THE ULTIMATE DESTINATION OF MANKIND CONSIDERED AS A BASIS FOR LOVE TO OUR NEIGHBOUR, AND AS A MOTIVE TO ITS EXERCISE.

THE present world is not the ultimate destination of mankind. It is only a passing scene through which they are now travelling to that immortal existence which will have no termination. Man is at present in the infancy of his being; his faculties are only beginning to expand, his moral powers are feeble and depraved, his intellectual views are circumscribed within a narrow range, and all the relations in which he stands demonstrate that the present scene is connected with the future, and is introductory to a higher sphere of action and enjoyment. "We know," says the Apostle Paul, "that if this earthly house of our tabernacle were dissolved, we have a building of God, an house not made with hands, eternal in the heavens." And our Saviour declares, that "the hour is coming, in which all that are in their graves shall hear his voice, and shall come forth," and that "our vile bodies shall be changed, and fashioned like unto his glorious body," and shall enter into the enjoyment of a new world, "which is incorruptible, undefiled, and which fadeth not away."

The capacity of making perpetual advances in knowledge and moral improvement in a future state of existence, is that in which the true dignity of man consists; and in this capacity, and the high destination with which it is connected, there is no difference between the high and the low, the slave who is chained to a galley, and the sovereign at whose nod the nations tremble. They are equally destined to immortality, and will exist in a future world, when time and all the arrangements of the present state shall come to a close. If man were only the creature of a day, whose prospects are bounded by this terrestrial scene, and whose hopes terminate in the tomb, it might appear a matter of comparatively little importance whether or not our benevolent regards were extended to our fellow-men, except in so far as our self-interest and avarice were concerned. The happiness of a fellow-creature might then be considered as a matter of indifference, and his dissolution, at death, a circumstance as trivial as the falling of a leaf in autumn, or the sinking of a stone to the bottom of the ocean. Even in this case, however, it would still be conducive to human happiness during the short and uncertain span of our existence, that all the branches of the human family were cemented together in union and affection. But when we reflect that all the intelligent beings around us, with whom we more immediately associate, and all those in distant lands with whom we are connected by the ties of one common nature, and on whom we depend for many of our comforts, are destined along with ourselves to an eternal world, in another region of the Creator's empire; and that the affections we now cultivate, and the conduct we pursue in reference to our brethren, have an intimate relation to that immortal existence;—this consideration stamps an importance on the exercise of brotherly affection which is beyond the power of human language to express. It shows us, that the dispositions which we now indulge, and the manner in which we treat the meanest of our fellow-creatures, may be recognised and attended with the most important effects a thousand millions of years hence, and may run parallel in their consequences even with eternity itself.

We may, perhaps, view it as a matter of trivial moment in what manner we now conduct ourselves towards a servant or a slave; whether we render his life miserable by hard labour, cruel insults, and contemptuous treatment, or study to promote his comfort and domestic enjoyment; whether we neglect to instruct him in the knowledge of his duty to his God and to his fellow-men, or labour to promote his moral and religious improvement. We may view with indifference or contempt the person and the family of a poor pious neighbour, who has earned a scanty subsistence by the sweat of his brow, and

may behold his body laid in the grave with as much apathy as we behold the carcass of a dog thrown into a pond. But could we follow the pious man beyond the precincts of the tomb, into that immortal scene which has burst upon his disencumbered spirit; could we trace the gradual expansion of his faculties towards objects which lie beyond the grasp of mortals, and the perfection of his moral powers; could we behold his mouldered frame starting up to new life at "the resurrection of the just," and arrayed in new splendour and beauty; could we contemplate him placed in a station of dignity and honour among the sons of God," in that glorious residence to which he is destined; his intellectual powers expanding, grasping the most sublime objects, and pushing forward in the career of perpetual improvement, without the least stain of moral imperfection;—would we now treat such a one with malevolence, or even with indifference or neglect? And were we placed by his side in such a dignified station, what would our feelings be when we recollected the apathy, the indifference, and even the contempt with which he was treated in this sublunary scene? On the other hand, could we follow the poor wretched slave to the future world, and contemplate the degradation and misery to which he is there reduced in consequence of our malevolence and neglect, what emotions of horror and indignation should we not feel at the recollection of that pride and disaffection which led us to act so basely towards a fellow-immortal, whom it was in our power to have trained to wisdom, to excellence, and to a happy immortality? When, therefore, we behold individuals withholding their benevolent regard from their brethren of mankind, and treating them with haughtiness and contempt, we must conclude that such persons overlook the true dignity of man, and secretly disbelieve the reality of an immortal state of existence, whatever professions they may make to the contrary. For the consideration of the eternal destiny of mankind reflects a dignity on the meanest human being, and attaches an importance to all our affections and actions in relation to him, unspeakably greater than if his existence were circumscribed within the narrow limits of time, and throws completely into the shade all the degrading circumstances with which he is now surrounded.

When we consider our brethren of the human family in the light of *immortal* intelligences, and look forward to the scenes of the eternal world, a crowd of interesting reflections naturally arises in the mind. A wide and unbounded prospect opens before us. Amidst new creations and the revolutions of systems and worlds, new displays of the Creator's power and providence burst upon the view. We behold ourselves placed on a theatre of action and enjoyment, and passing through "scenes and changes" which bear no resemblance to the transactions and events of

his sublunary world. We behold ourselves mingling with beings of a superior order, cultivating nobler affections, and engaged in more sublime employments than those which now occupy our attention. We behold ourselves associated with men of all nations and kindreds, and with those who lived in the remotest periods of time. Millions of years roll on after millions, our capacities and powers of intellect are still expanding, and new scenes of beauty and magnificence are perpetually bursting on the astonished mind, without any prospect of a termination.—Amidst those eternal scenes, we shall doubtless enter into the most intimate connexions with persons whom we have never seen, from whom we are now separated by continents and oceans, with those whose bodies are now mouldering in the dust, with those who have not yet entered on the stage of existence, and with those with whom we now refuse to associate on account of their rank, and station, and religious opinions. That man, into whose dwelling we would not at present deign to enter, and with whom we would abhor to mingle in the public services of religion, may then be one of our chief companions in the regions of bliss, in directing and expanding our views of the glory and magnificence of God. The man whom we now hate and despise, and whose offers of assistance we would treat with disdain, may in that happier world be a principal agent in opening to our view new sources of contemplation and delight. That servant whom we now treat as a being of inferior species, at whom we frown and scold with feelings of proud superiority, may be our instructor and director, and every way our superior, in that region where earthly distinctions are unknown. That humble instructor whom we now despise, and whose sentiments we treat with contempt, may, in that world of intelligence and love, be our teacher and our guide to direct our views of the attributes of the Deity, of the arrangements of his providence, and of the glories of his empire. There the prince may yield precedence to his subjects, the master to the slave, and the peer to the humblest peasant. For no pre-eminence of birth, fortune, or learning, no excellence but that which is founded on holiness and virtue, on moral and intellectual endowments, will have any place in the arrangements of that world where human distinctions are for ever abolished and unknown. And shall we now refuse to acknowledge those who are to be our friends and companions in that future world? Is it not agreeable to the dictates of reason and to the voice of God that we should regard them with complacency and affection, whatever be the garb they now wear, whatever be their colour or features, and in whatever island or continent they may now reside?

It must, indeed, be admitted, that all the inhabitants of our world will not be exalted to dignity and happiness in the future state. A great pro-

portion of them, in their present state of depravity and degradation, are altogether unqualified for participating in the exercises and enjoyments of celestial intelligences. Whole nations are still overspread with intellectual darkness, ignorant of their eternal destination, and immersed in immoralities and vile abominations. And, even in those countries where the light of revelation has dispelled the gloom of heathenism, a vast mass of human beings are to be found, "having their understandings darkened, alienated from the life of God," and sunk into the mire of every moral pollution. Still, we have no reason, on this account, to overlook their native dignity, and their high destination. Every human being we see around us, however low in rank, or degraded by vice, is *endowed with an immortal nature, and is capable of being raised to the dignity of an inhabitant of heaven*; and there is not a single individual to whom we can point, either in our own country or in other lands, in relation to whom we are authorized to affirm, that he will not be a participator in immortal bliss. And, therefore, every man with whom we associate, and whom we recognize in the circle of society around us, ought to be viewed as one with whom we may associate in the world to come. And as to those who appear to be partially enlightened and renovated in their minds, we ought not to withhold our affection and complacency on account of their ignorance, their contracted views, or erroneous opinions. We should view them, not as they are in their present state of infancy and weakness, but as they will be when arrived at maturity and manhood; not as they appear in the first weak essays of their intellectual powers, and in the lowest step of their existence, but as they will appear in their career of improvement after a lapse of millions of ages. Carrying forward our views to those eternal scenes, and accompanying our brethren of the human family through all the gradations of their existence in future worlds, we behold their faculties in progressive expansion, their minds approximating nearer to the source of eternal wisdom, their views of the empire of Omnipotence continually enlarging, their knowledge of the plan of redemption, and its numerous bearings, for ever increasing; their love and affection to God and to fellow intelligences waxing into a more ardent flame; every evil propensity corrected, every imperfection removed, every blossom of virtue fully expanded, and "joy unspeakable and full of glory" pervading every faculty of their souls. And can we behold intelligent minds, capable of so high and dignified attainments, and the companions of our future destiny, with indifference or contempt? Is there not here a broad foundation laid for the most expansive emanations of love towards every member of the great family of mankind, however much he may be obscured, and sullied by folly and sin in this first stage of his existence?

In the mean time, while the greater part of mankind are immersed in ignorance and vice, while the image of their Maker is defaced, and their immortal powers prostituted to the vilest passions, the most noble and honourable operation in which love can be engaged, is to devise and execute schemes by which our degraded brethren may be raised to intellectual and moral excellence: to train up young immortals in religion and virtue; to diffuse the principles of useful knowledge among all ranks; to counteract the diabolical spirit of war and contention; to abolish slavery in every shape; to meliorate the social and domestic condition of the lower orders of society; to publish the revelation of God in every language, and to send forth the messengers of salvation to every land, to instruct men of all nations and kindreds and tongues in the knowledge of the true God, and of the path which leads to a blessed immortality. Thus shall we be enabled to manifest our love towards all our brethren of the human family; thus shall we contribute to render them worthy of our highest affection, and to prepare them for the exalted exercises and employments of the life to come.

#### SECTION IV.

LOVE TO GOD AND OUR NEIGHBOUR ENFORCED AND ILLUSTRATED, FROM A CONSIDERATION OF THE MISERABLE EFFECTS WHICH WOULD ENSUE WERE THESE PRINCIPLES REVERSED, AND WERE RATIONAL BEINGS TO ACT ACCORDINGLY.

THE two leading principles which I have endeavoured to illustrate, in the preceding pages, form the basis of the moral order of the intelligent universe. Consequently, were these principles reversed, and were moral agents to act accordingly, the moral world would soon be transformed into a scene of the most dismal anarchy and confusion. Every action would be dictated by feelings of pure *malevolence*, and misery in every shape would be the great object which human beings would exert their powers to accomplish. Could we suppose for a moment, that society could subsist for any length of time under the unrestrained operation of such a principle, the following, among many thousands of similar effects, would be the natural and necessary results.

Every individual would exhibit, in every action, the character of a fiend; and every family would display a miniature picture of hell.—Between the husband and wife there would be nothing but incessant brawling, dissension, and execration. Whatever was ardently desired by the one would be as resolutely and obstinately opposed by the other; and the fury and resentment excited by unsatisfied desires, and disappointed

hopes, would destroy every vestige of peace and tranquillity, and stimulate a host of infernal passions to rage without control. Their children would be actuated by the same diabolical tempers. The son would take an infernal pleasure in cursing, insulting, and reproaching "the father that begat him," and in trampling with scorn and indignation on the mother who gave him birth.—Brothers and sisters would live under the continual influence of malice and envy, "hateful, and hating one another." Whatever actions tended to irritate, to torment, and to enrage the passions of each other, and to frustrate their desires and expectations, would be performed with a grin of infernal delight. Mutual scuffles and execrations would ensue. One would have his eye-ball bruised, or knocked out of its socket, another would have his teeth driven out of his jaws; one would have his hair torn from its roots, another his skull fractured with repeated blows; the legs of one would be full of bruises and putrifying sores, and the face of another all over covered with blotches and scars, most hideous to behold; and, in the progress of contention, the hand of a brother would plunge his dagger into a brother's heart. In larger societies, fraud, falsehood, deceit, seduction, quarrels, oppression, plunder, rapine, murder, and assassination, would be the common occurrences of every day and every hour. The seller would uniformly endeavour to cheat the buyer, and the buyer would endeavour, by every kind of fraud, or open force, to deprive the seller of the value of his commodities. Poison would be sold for medicine, and deleterious mixtures and poisonous drugs would be mixed up with the common articles of food, that the venders might enjoy the diabolical pleasure of hearing of the pains, the agonies, and the dying groans of the victims of their villany. The debauchee would triumph in the number of victims he had rendered wretched and forlorn by his wiles and depraved passions; the strong would oppress the weak, and rejoice in depriving them of every comfort, and the powerful would exult in trampling under their feet the persons and the property of the poor, and in beholding the extent of the miseries they had created.

In the common intercourse of life, every one would be maltreated, insulted, and reproached, as he walked along the street; the lip would be shot out with a diabolical grin at every passenger, which would be returned with the frown and the scowl of a demon. Every passenger that met another on the highway would be encountered with blows, execrations, and reproaches; and he who met his neighbour unawares in the recesses of a forest, would receive a dagger in his breast before he was aware of his danger. Words would be exchanged between man and man that would cut each other's hearts "like the piercings of a sword," and horrible contentions, accompanied with rage and fury, and wounds

and bruises would be presented to the view in every city, and village, and rural scene. When one had finished a house to shelter him from the storm, a number of desperadoes, in horrid combination, would overturn the mansion, and crush him among the ruins. When one had planted vines and fruit-trees, others would seize the opportunity, when they were beginning to bud and blossom, to tear them up by the roots; persons who sowed the seed in spring could have no confidence that they would ever reap the fruits in autumn; and no one could have the least security that the wealth and property he possessed to-day would be his to-morrow. No one could feel secure for a single hour, that his life was not in danger from the sword of the murderer or the assassin; every man would live in continual fear and alarm; no pleasing prospects nor hopes of future enjoyment would ever calm the tumultuous passions, or cheer the distracted mind; all confidence between man and man would be completely destroyed; falsehood in every shape would walk triumphant; the mind would be distracted amidst its ignorance of the scenes and events that were happening around it; for no intelligence could be believed, and no one could certainly know the reality of any object or event, unless he beheld it with his own eyes. Schools, seminaries of learning, universities, and academies would have no existence, and no one could gain an acquaintance with any principle or fact in the universe around him, except in so far as he had made the investigation by means of his own senses and powers. Tormented by tumultuous passions raging within, in continual alarm from desperadoes, plunderers, and assassins raging around, looking back on the past with horrible recollections, and contemplating the future with terror and dismay, the mind would feel itself fixed in a scene of misery and wretchedness, which no words could describe nor pencil delineate.

If we could suppose a number of such beings leagued together for the purpose of carrying the schemes of malevolence more completely into effect, one of their employments would be to set fire to houses and villages, in order that they might enjoy the infernal pleasure of seeing their fellow-creatures deprived of every shelter, and of beholding men, women, and children roasting in the flames. Another employment would be to poison the springs of water, that they might behold one after another, from the sucking child to the hoary head, seized with excruciating pains, and sinking into the agonies of death. Another gratification of malevolence would be to dam up the rivers in their rapid course, that they might overflow the circumjacent plains, in order that they might feast their eyes on the scenes of devastation and ruin that would thus be created, and on the terror and destruction of the wretched inhabitants. The conflagration of a city, with

all its accompaniments, the crash of falling houses, and of palaces tumbling into ruin; the terror and confusion of its inhabitants, the wailings of women and children, and the groans of the burning victims, would be a feast to the eyes and music to the ears of such malignant beings, as they once were to *Nero*, when, from the top of a high tower, he beheld Rome wrapt in the flames which he himself had kindled, and sung on his lyre the destruction of Troy. Even in the midst of the ocean such revolting scenes would be frequently realized. When two ships descried each other, a diabolical onset would ensue. To set on flames the respective vessels, to sink them in the deep, or to cause them to burst with a horrid explosion, would be the object of both the crews; that they might feast their malevolence on the spectacle of wounds and carnage, of drowning wretches covered with blood and scars, fighting with the billows, and scrambling for safety among the shattered fragments of the wreck.

Were it possible that discoveries in art and science could be made by intelligences actuated by such malignant passions, they would be all applied to subserve the purposes of malevolence. The force of gunpowder would be employed to blow ships and houses to atoms, to shake populous cities to their foundations, and to create among their inhabitants universal horror and alarm; the force of steam would be employed in producing destructive explosions, and in propelling the instruments of death and devastation among a surrounding populace. Air balloons would be employed for enabling them to carry their malignant schemes, in relation to distant tribes, more speedily into effect; for hurling down upon towns and villages stones, and bullets, and darts; and for enabling them to escape in safety when they had finished the work of destruction. The discovery of the nature of lightning, and its identity to the electrical fluid, instead of being applied for the protection of persons and of buildings from the stroke of that terrific meteor, would be destined to the purpose of devastation and destruction. The electricity of the atmosphere and the lightnings from the clouds would be conducted and directed so as to set on fire stacks of corn, to shatter lofty buildings, and lay groups of men and cattle prostrate with the dust. Every mechanical power, and all the combinations of physical forces which art can produce, would be applied to the framing of engines for torture, devastation, and massacre; and on the front of every new invention would be displayed, as if engraved in legible characters—**TERROR, MISERY, AND DESTRUCTION.**

Could we suppose for a moment such beings occasionally combining together on a large scale, for the purpose of more extensively glutting their malevolence, their conduct towards each other as nations, and the contests in which they would be

engaged in this capacity, would be tremendous and horrible beyond the power of description. Every malevolent affection would be brought into action; every infernal passion would be raised to its highest pitch of fury; every one, stimulated by his associates, would breathe nothing but revenge, execrations, slaughter, and utter extermination against opposing armies; every engine of human destruction which ingenuity could invent would be brought into the scene of action; the yell of demons would accompany the fierce and sanguinary onset; and a scene of horror would ensue beyond the power of imagination to conceive, which would not terminate till the one class of combatants had exterminated the other; till they had trampled down and destroyed the fruits of their ground, and turned their land into a wilderness; till they had burned their villages to ashes, and tumbled their cities into a heap of ruins; till they had drenched their fields with blood, and strewed them with skulls, and limbs, and the mangled carcasses of thousands and ten thousands of men, women, and children, thrown together in horrible confusion. But it is needless to dwell on such scenes; since the history of all nations—since even the history of modern Europe presents us with spectacles of horror, scarcely inferior to those I have now described, and with moral agents who bear too striking a resemblance to those whose actions are completely subversive of the second commandment of the law, "*Thou shalt love thy neighbour as thyself.*"

Such, then, would be some of the dreadful effects which would flow from a subversion of the second principle of the moral law, if we could suppose that organical intelligences, *not endowed with immortal bodies*, could exist for any length of time amidst such scenes of depravity and wretchedness. But it is more than probable that such a state of society could not long subsist in such a world as we now inhabit, and among rational beings, whose corporeal organization is constructed after the model of the human frame. The whole mass of society in every land would soon be transformed into one boundless scene of anarchy and confusion; every one would flee from his neighbour as from an infernal fiend; a war of universal extermination would commence; nothing would be beheld over all the regions of the globe but spectacles of rapine, devastation, and destruction; and nothing would be heard among all the eight hundred millions of its inhabitants but the voice of execration, and the yells of lamentation, and mourning, and woe, till at length every beauty which now adorns the face of nature would be effaced, every fertile field transformed into a desert, every human habitation overturned, and every inhabitant of the earth sunk into oblivion.\* This is one of the most

\* Whether such scenes as some of them now described may be realized in the future state of pu-

terrible representations we can form of the horrors of the future state of punishment, where malevolent passions rage without control; and the considerations now stated demonstrate, that the man who is actuated by a principle of hostility towards his neighbour, is training and preparing himself for becoming an inhabitant of that miserable and dreary region, "where the worm dieth not, and the fire" of malevolence and revenge "is never quenched." We are thus instructed, that if there be a future state at all, it *must*, from the very nature and constitution of things, be a state of misery and horror to every man whose mind is under the unrestrained dominion of depraved affections and malignant passions; so that there is no possibility, in such a case, of escaping the "wrath to come," unless the moral constitution of the intelligent universe were entirely subverted.

If, then, it appears that such dismal consequences would flow from the subversion of this principle or law, it is obvious that the law itself must be "holy, just, and good," and calculated to promote the perfection and happiness of all created intelligences, among whom it is found in full operation. And in a world such as ours, where this law is partially violated, the consequent misery which is suffered will be nearly in proportion to the extent to which this violation is carried, and to the number of individuals who are actuated by a principle of opposition to its requirements.

In like manner, it might be shown, that the most dismal effects would be produced, were the first principle of the moral law reversed, and the malevolence of intelligent beings directed towards their Creator. In this case, instead of assembled multitudes joining in solemn adorations of the divine character and perfections, the God of heaven would be blasphemed, and his name abhorred in every land. Instead of reverence and profound humility in the presence of Jehovah, a spirit of pride and independence, and an impatience of control, would pervade every mind. Instead of thanksgivings for the bounties of his providence, the basest ingratitude would be manifested, and the most marked contempt of all his favours. Instead of cordial submission to his wise arrangements, nothing but murmurings and repinings would be heard, and the most presumptuous decisions uttered against all the dis-

nishment, or whether the principles of the moral law will be entirely subverted among the miserable beings who are subjected to that punishment, it becomes not us positively to determine. But we can scarcely conceive a more horrible idea than that of intelligent beings acting uniformly from principles of pure malevolence, and at the same time endowed with *immortal bodies*, capable of sensations similar to those we now feel. In this case, every accumulated wound received from malignant associates would be an additional source of pain and misery which would continually increase, without any prospect of relief from the sickness or death.

passions of his providence. Instead of complacency and delight in his character and operations, insults and reproaches would burst forth at every display of his wisdom, justice, and omnipotence. Instead of admiration of the beauty and grandeur of his wonderful works in heaven and earth, feelings of contempt and disdain would be mingled with all their surveys of the operations of nature. His omnipotence would be disregarded, his benevolence called in question or despised, and his wisdom and intelligence arraigned. Like Alphonso, king of Castile, they would not hesitate to affirm, "If we had been of God's privy council when he made the world, we would have advised him better." Under the influence of such diabolical dispositions, the harmony of the visible creation would be attempted to be deranged, and its beauties defaced, in so far as their limited powers would be able to effect. The fields would be stripped of their verdure; the forests would be torn up by the roots, and strewed in shapeless masses along the plains; the vegetable beauties which now diversify the rural landscape would be effaced; the rivers would be turned out of their courses to overflow the adjacent plains, and to transform them into stagnant marshes and standing pools; the air would be impregnated with pestilential vapours; and the grand, and beautiful, and picturesque scenes of nature would be stripped of their glory, leaving nothing but naked rocks and barren deserts, covered with the wrecks of nature, to mark the operations of malevolence.

Such would be the dispositions and the conduct of intelligent beings were the first principle of the moral law reversed, and their actions regulated by a principle of malevolence: and such, in a greater or less degree, are the dispositions of every man in whose heart the love of God has never taken up its residence. Revolting as the scenes now supposed must appear to every mind possessed of moral feeling, they must be admitted to be the necessary results of malignant passions raging without control. And if there be any region of creation in which pure malevolence actuates its inhabitants, we must suppose the restraining influence of the Almighty interposed, to preserve their malignant operations within those bounds which are consistent with the plans of his moral government and the general happiness of the intelligent universe. That principles and practices have existed among mankind, which, if left to operate without restraint, would produce all the effects now supposed, appears from the description which the apostle Paul gives of the character of the Gentile world, and even of that portion of it which had been brought into a civilized state. He declares that "they did not like to retain God in their knowledge, but changed the glory of the incorruptible God into an image made like to corruptible man, and

to birds, and four-footed beasts, and creeping things," that they were "filled with all unrighteousness, fornication, wickedness, covetousness, *maliciousness*;" that they were "full of envy, murder, deceit, malignity, backbiters, *haters of God*, spiteful, proud, boasters, inventors of evil things, disobedient to parents; without understanding, *without natural affection, implacable, unmerciful*. Who, knowing the judgment of God, that they who commit such things are worthy of death, not only do the same, but have pleasure in them that do them." Were practices and passions of this description, which are all directly opposed to the principle of benevolence, to operate without control, the universe would soon be transformed into a boundless scene of devastation and sterility, of misery and horror, of lamentation and woe.

Turning our eyes from such revolting scenes, I shall now direct the attention of my readers to a more pleasing picture, and endeavour to delineate some of the happy effects which would naturally result from a complete conformity in thought and action to the principles of the divine law.

## SECTION V.

### EFFECTS WHICH WOULD FLOW FROM THE FULL OPERATION OF THE PRINCIPLE OF LOVE TO GOD AND TO MAN.

WERE this divine principle in full operation among the intelligences that people our globe, this world would be transformed into a paradise, the moral desert would be changed into a fruitful field, and "blossom as the rose," and Eden would again appear in all its beauty and delight. Fraud, deceit, and artifice, with all their concomitant train of evils, would no longer walk rampant in every land. Prosecutions, lawsuits, and all the innumerable vexatious litigations which now disturb the peace of society, would cease from among men. Every debt would be punctually paid; every commodity sold at its just value; every article of merchandise exhibited in its true character; every promise faithfully performed; every dispute amicably adjusted; every man's character held in estimation; every rogue and cheat banished from society; and every jail, bridewell, and house of correction, would either be swept away, or transformed into the abodes of honesty, industry, and peace. Injustice and oppression would no longer walk triumphant through the world, while the poor, the widow, and the fatherless were groaning under the iron rod of those who had deprived them of every comfort. No longer would the captive be chained to a dungeon, and doomed to count, in sorrow and solitude, the many long days and years he has been banished from the light of day

and the society of his dearest friends. No longer should we see a hard-hearted creditor doom a poor unfortunate man, for the sake of a few shillings or pounds, to rot in a jail, while his family, deprived of his industry, were pining away in wretchedness and want. No longer should we hear the harsh creaking of iron doors, ponderous bolts, and the clanking of the chains of criminals; nor the sighs and groans of the poor slave, fainting under the lash, and the reproaches of a cruel master. The bands of the oppressed would be loosed, the captives would be set at liberty, the iron fetters would be burst asunder, and a universal jubilee proclaimed throughout every land. The haunts of riot and debauchery would be forsaken, and their inmates hissed from the abodes of men. The victims of seduction would no longer crowd our streets at the dead hour of night, to entice the "simple ones" into the paths of vice and destruction; but purity, righteousness, and peace would "run down our streets like a river," distributing safety, happiness, and repose.

The tongue of the slanderer and the whisperings of the backbiter would no longer be heard in their malicious attempts to sow the seeds of discord and contention among brethren. Falsehood in all its ramifications, with the numerous train of evils it now produces, would be banished from the intercourse of society; nor would treachery prove the ruin of families and societies, and interrupt the harmony of the commercial and the moral world. No longer should we hear of the embezzling of property by unfaithful servants, nor the blasted hopes, the cruel disappointments, and the ruin of credit and of reputation now produced by the votaries of falsehood. "The lips of truth would be established for ever," and the liar and deceiver would be hissed to the shades of hell. Our property would remain sacred and secure from the thief and the midnight robber, and our persons from the attacks of the murderer and the assassin. We should no longer hesitate to prosecute our journeys by day or by night for fear of the foot-pad or the highwayman, but should recognize every passenger as a friend and protector. Plunder and devastation would cease from the earth; "violence would no more be heard in our land; nor wasting nor destruction in all our borders." Execrations and malicious insults would never harrow up the feelings of our fellow-men, nor would a single instance of revenge be heard of among all the inhabitants of the earth.

Pride, which now stalks about with stately steps and lofty looks, surveying surrounding intelligences with feelings of contempt, would be for ever banished from the world. Ambition would no longer wade through slaughter to a throne, nor trample on the rights of an injured people. Wars would cease to the ends of the earth, and the instruments of human destruction

would be beaten into ploughshares and pruning-hooks. That scourge which has drenched the earth with human gore—which has convulsed every nation under heaven—which has produced tenfold more misery than all the destructive elements of nature, and which has swept from existence so many millions of mankind—would be regarded as the eternal disgrace of the human character, and the most shocking display of depravity in the annals of our race. No longer should we hear "the sound of the trumpet and the alarm of war," the confused noise of "the horseman and the bowman," and of the mighty armies encamping around "the city of the innocent," to hurl against its walls the instruments of destruction. No longer should we behold the fires blazing on the mountain tops, to spread the alarm of invading armies; nor the city, which was once full of inhabitants, "sitting solitary," without a voice being heard within its dwellings but the sighs of the disconsolate and the groans of the dying. Human wolves thirsting for the blood of nations, would cease to prowl among men. Nation would not lift up sword against nation, neither would they learn war any more. The instruments of cruelty, the stake, the rack, the knout, and the lash, would no longer lacerate and torture the wretched culprit; canons, and guns, and swords, and darts would be forged no more; but the influence of reason and affection would preserve order and harmony throughout every department of society. The traveller, when landing on distant shores, and on the islands of the ocean, would no longer be assailed with stones, spears, arrows, and other instruments of death, and be obliged to flee from the haunts of his own species, to take refuge in the lion's den, or on the bosom of the deep; but would be welcomed as a friend and a messenger of peace. The animosities which now prevail among religious bodies would cease; the nicknames by which the different sects of religionists have been distinguished, would be erased from the vocabulary of every language; Christians would feel ashamed of those jealousies and evil surmisings which they have so long manifested towards each other, and an affectionate and harmonious intercourse would be established among all the churches of the saints.

These, and a thousand other evils, which now render this world a vast wilderness of perturbation, wretchedness, and sorrow, would be completely eradicated, were the principle of holy love in incessant operation; and in their place a scene of loveliness and moral beauty would burst upon the view, which would diffuse joy and ecstatic delight through every bosom.

Every family would become a mansion of peace and love—a temple consecrated to the God of heaven, from which the incense of prayer, and praise, and pious aspirations, would daily ascend in sweet memorial to the throne above.

Domestic broils and contentions would cease; brothers and sisters would be cemented in the closest bonds of holy affection; the law of kindness would swell their hearts and dwell upon their tongues; serenity and joy, and a desire to please, would appear on every countenance; a mutual exchange of sentiment and generous affections would circulate joy from father to son, and from children to parents; and all the members of the family circle, animated by the same benevolent spirit, would "dwell together in unity." To communicate useful knowledge, to train each other to piety and virtue, to point out the different spheres in which benevolence should act, to assist in every kindly office, to sooth each other in distress, and to direct each other in the path to an endless life, would be the unceasing desire and endeavour of every inmate of the family mansion. From every such mansion, the radiations of love would fly from family to family, from one hamlet and village to another, from one town and city to another, from one nation to another, and from one continent to another, till all the families of the earth were converted into "the dwellings of the God of Jacob."

In larger communities the principle of love would effectuate a mighty change. That spirit of jealousy and selfishness, of avarice and monopoly, which now produces so many jarrings, contentions, and collisions of interests among town councils, corporations, and other smaller associations, would cease to operate. Every one would see and feel, that the prosperity of the whole is also the prosperity of every portion of the general community. Boisterous disputations, sneers, hisses, reproaches, and angry passions, would be banished from the deliberations of every society; and candour, good-will, and kindly affections would animate the minds of all its members. Righteous laws would be enacted, and distributive justice equitably administered. Every nation would form one great and harmonious family; all its members being linked together by the ties of kindness and reciprocal affection. Its magistrates would become "nursing fathers" to the whole body of the people, to promote their peace, their domestic comfort, their knowledge, and their general improvement; and throughout all ranks of the community nothing would appear but submission, obedience, reverence, and respect.

The mutual intercourse of nations would be established on the principles of friendship and affection, and on the basis of immutable justice and eternal truth. Raised above petty jealousies, secure from the alarms of war, and viewing each other as branches of the same great family, and as children of the same Almighty Parent,—every nation and empire would feel an interest in promoting the prosperity of another, and would rejoice in beholding its happiness and improvement. Commerce would be free and unshackled,

and the productions of nature and of art would quickly be transported into every nation from every clime. Travellers and navigators would visit foreign shores without danger or alarm from insidious or hostile tribes, and would land on the most obscure island of the ocean, fully assured of protection and comfort, and the welcome of friendship and affection. Every vessel that ploughed the deep would become a floating temple, from which incense and a pure offering would daily ascend to the Ruler of the skies; and its mariners would join, with one heart and one mind, in imploring upon each other the blessing and protection of the God of heaven. The beams of love and affection would gladden every land, and add a new lustre to the natural beauties of its landscape. The inhabitants of China and Japan would be hailed as benefactors when they arrived on our coasts with their cargoes of tea, sugar, silk, and porcelain; and the natives of France and Great Britain, when they transported their manufactures to these distant empires, would be welcomed as friends, and conducted, without the least jealousy or suspicion, through all their cities and rural scenes, to survey the beauties of nature and art with which those countries are adorned. The natives of Papua and New-Zealand would land on our shores without spears, or darts, or other hostile weapons, and be recognized as friends and brethren; and our countrymen, when traversing the different regions of the globe, would always meet with a cordial reception when landing on their coasts. For national jealousies and antipathies would cease; and instead of selfish and revengeful passions, reason would be cultivated, and its powers expanded; the smile of benevolence and the hand of beneficence would gladden the inhabitants of every clime, and "righteousness and praise would spring forth before all the nations."

Under the benignant influence of the spirit of love, useful intelligence of every description would be rapidly and extensively communicated; the sciences would be improved, and carried forward to perfection; the jealousies which now exist among scientific men would cease to operate, and every fact on which science is built would be impartially investigated, and exhibited in its true aspect; the arts would flourish, and be carried to the highest pitch of improvement; no secrets in arts or trades would be locked up in the breast of the discoverer; but every useful hint would at once be communicated to the public; every invention would uniformly be applied to the promotion of a benevolent object, and the arts of destruction would cease to be cultivated, and be held in universal detestation. Under the hand of art, the habitations of men would be beautified and adorned, to correspond with the purity and improvement of their moral feelings, and a new lustre would

be thrown over the face of nature. Towns and villages would be built on spacious plans, divested of all that gloom and filth which now disgrace the abodes of millions of human beings, and which form an emblem of their physical and moral wretchedness; and the landscape of every country would present a scene of grandeur, fertility, and picturesque beauty. Those immense treasures which have been so long expended in the arts of war and devastation would be employed in turning immense deserts into fruitful fields, in beautifying the aspect of rural nature, in planting orchards and vineyards, in forming spacious roads, in establishing seminaries of instruction, in erecting comfortable habitations for the lower orders of society, and promoting their domestic enjoyment. What an immense variety of objects of this description would be accomplished within the limits of Great Britain by means of a thousand millions of pounds, which we all know have been lately expended within the space of twenty-four years, in carrying forward the work of destruction!

Under the influence of the reign of love, the instruction of all ranks, in every department of useful knowledge, would be rapidly promoted; ignorance and error, with all their attendant evils, would soon vanish from the minds even of the lowest orders of society; seminaries would be erected and established on a liberal basis, for instructing every class of mankind in all those branches of science which tend to expand the capacity of the human mind, and to extend the range of its contemplations; the hours of active labour would be abridged, in order that they might have leisure for the cultivation of their understanding and the exercise of their moral powers. To add to their stock of knowledge, and to increase the sum of happiness around them, would be considered as interesting and as delightful as it now is to the sons of Mammon to "add house to house, and field to field," and to riot on the gains of avarice. Societies would be formed for mutual improvement in knowledge and virtue; lectures delivered on every interesting and useful subject; experiments performed to illustrate the order and mechanism of nature; and instruments of every description procured for exhibiting the wisdom and omnipotence of the Creator and the glories of the universe. The revelation of heaven would be studied with intelligence in all its aspects and bearings, and every passion, affection, and active exertion would be directed by its moral requisitions. The human mind, thus trained and carried forward in wisdom and holiness, would shed a moral radiance around it, and be gradually prepared for entering on a higher scene of contemplation and enjoyment.

Among all ranks of men, a spirit of selfishness and avarice would be extinguished, and in its stead a spirit of noble generosity and benefi-

cence would pervade the whole mass of society. That divine maxim inculcated by our Saviour, "*It is more blessed to give than to receive,*" would be engraven on every heart, and appear in every action. This sublime principle forms a prominent trait in the character of God, and in all his arrangements towards his creatures; and it animates the minds of superior intelligences in their associations with each other, and in their occasional intercourses with the inhabitants of our world. In imitation of these glorious beings, the human race would consider it as the grand end of their existence, not merely to acquire wealth, knowledge, or power, but to employ themselves in the unceasing diffusion of beneficence to all around. To communicate happiness throughout all the ranks of their fellow-men with whom they mingle, to sooth the disconsolate and the desponding, to relieve the distressed, to instruct the ignorant, to expand the intellect, to animate and direct the benevolent affections, to increase the enjoyments of the lower orders of the community, to direct the opening minds of the young, to lead them by gentle steps into the paths of wisdom and holiness, and to promote every scheme which has a relation to the public good, would form the constant aim of all conditions of men from the highest to the lowest. Every house would be open to the weary and benighted traveller, every heart would welcome him to the refreshments and repose it afforded, every countenance would beam benignity, every comfort would be afforded, every wish anticipated, and every stranger thus entertained would "bless the mansion," and implore the benediction of heaven on all its inmates. The houseless child of want would no longer wander amidst scenes of plenty, tattered and forlorn, pinched with poverty, exposed to the piercing blasts, and obliged to repose under the open canopy of heaven, for want of more comfortable shelter; the poor would soon cease out of the land, every one would be active and industrious, and every one would enjoy a comfortable portion of the bounties of Providence. And what a happy world would it be were kindness and affection the characteristic of all its inhabitants! The face of nature would wear a more cheering aspect, "the desert would rejoice and blossom as the rose," the flowers would look more gay, the "little hills" would be encircled with joy, the light of heaven would appear more glorious and transporting, a thousand delightful emotions would spring up in the mind amidst every rural scene, and every social intercourse would be a source of unmingled bliss. Paradise would be restored, heaven would descend to earth, and an emblem would be presented of the joys of the blessed above.

O blissful and auspicious era! When wilt thou arrive to still the restless agitation of malignant passions, to promote peace on earth and good will among men? When will the benevo-

lence of angels and archangels descend to dwell with man upon earth, to expel selfishness from the human breast, to hush every disordered affection, and to restore tranquillity and order among the bewildered race of Adam? When will the spirit of love, in all its beneficent energies, descend from the Father of light to arrest the convulsions of nations, to heal the wounds of suffering humanity, to transform fields of slaughter into regions of tranquillity, to soften the ferocious tempers of "the people who delight in war," to unite in one holy and harmonious society men of every language and of every tribe? Not till Christianity shall have shed its benign influence on every land; not till "the knowledge of the Lord shall cover the earth," and the canons, and swords, and spears, and battle-axes of the warrior shall be broken to shivers, and forged into ploughshares and pruning-hooks. "Then shall the wolf dwell with the lamb, and the leopard shall lie down with the kid, and the calf, and the young lion, and the fating together, and a little child shall lead them." "Then judgment shall dwell in the wilderness, and righteousness in the fruitful field. And the work of righteousness shall be peace, and the effect of righteousness, quietness and assurance for ever. And all people shall dwell in peaceable habitations, and in sure dwellings, and in quiet resting-places."

In fine, under the reign of love, most of the evils, both physical and moral, under which men are now doomed to suffer, would be either greatly mitigated or completely abolished. It is scarcely too much to affirm, that nine-tenths of all the evils that affect humanity are the result of the malice and unkindness of mankind towards each other. If all the sorrow and wretchedness produced by fraud, falsehood, avarice, extortion, injustice, oppression, perjury, seduction, treachery, litigations, slander, pride, ambition, revenge, robbery, murder, plunder, and devastation, were extirpated, little would remain besides the incidental evils which occasionally flow from the elements of nature. And even these would be greatly mitigated by the benevolent operations of art, directed by the discoveries of science. By clearing the surface of the globe of immense forests, by draining stagnant marshes, and by the universal cultivation and improvement of the soil, the seasons would be meliorated, and storms and tempests would be deprived of their wonted violence and fury; and the partial physical evils which still remained would be almost annihilated to the sufferer, by the sympathy, and tenderness, and the kind and fostering hand of universal benevolence. Where virtue, temperance, serenity of mind, and social joy reigned triumphant, and where none of the ghastly phantoms of skepticism and superstition haunted the mind, disease would seldom invade the human frame; the span of mortal existence would be extended; death would become calm and tran-

quil, and every one would "come to his grave, like as a shock of corn cometh in his season." In short, under the influence of the emanations of love, malignity would be transformed into benevolence, vice into virtue, oppression into justice, cruelty into sympathy and tenderness, selfishness into beneficence, contention into unity and friendship, fraud into honesty, avarice into generosity, pride into humility, wretchedness into comfort, sorrow into joy, war into peace, and this spacious globe, now the receptacle of misery and vice, would be transformed into the temple of concord, happiness, and peace.

Such are some of the beneficial effects which would be experienced in the social state of the human race, were a principle of benevolence to pervade the minds of mankind. The immense mass of moral evils, under which the earth now groans, would be removed; the moral aspect of society, in every nation, would assume a new lustre of loveliness and excellence; and nature herself would be arrayed in new robes of gracefulness and beauty. For it would be easy to show, were it at all necessary, that every particular now stated, and a thousand similar effects, would be the *natural* and *necessary* results of *love*, when it becomes the mainspring of human actions.

I shall now shortly trace some of the effects of love, considered as directed more immediately towards God.

Supreme love to God would excite complacency in his character and perfections; and piety, in all its fervent and delightful emotions, would naturally flow upwards to the fountain of all purity. His glorious character would be venerated, and his name revered over all the earth; trophies would be erected to his honour, and temples consecrated to his worship in every land. Crowds of worshippers, beaming benignity and devotion, would be held in every region, converging towards the "dwelling-place" of the Most High, and encouraging one another in such language as this: "Come ye and let us go up to the mountain of the Lord, to the house of the God of Jacob, and he will teach us of his ways, and we will walk in his paths." With enlightened views of the attributes of Jehovah, with glowing affections, and with profound reverence, would they join in the sublime exercises of the sanctuary, and listen to the intimations of his will. All voices would be tuned to melodious strains, and the solemn organ, and those instruments of music which are now devoted to the gratification of the sons of fashionable folly and dissipation, would harmonize in exciting devotional affections, and in swelling the song of salvation "to Him who sits upon the throne, and to the Lamb who hath redeemed us to God by his blood." Every landscape, in every point of view, would present a noble edifice devoted to the worship of the God of heaven, adorned with every majestic decoration suitable to its sanctity, and

rearing its spacious dome above all the surrounding habitations of men. Its gates "would be open continually; they would not be shut day nor night," that men might have access at all seasons to bring "incense and a pure offering" to the shrine of Jehovah. The whole earth would soon be converted into one universal temple, sacred to the God and Father of our Lord Jesus Christ, from which, thanksgiving, and the voice of melody, and the holy aspirations of gratitude and love, would ascend to heaven without intermission, and in every direction, from the regions of the north to the regions of the south, and "from the rising of the sun to the going down of the same." Solemn seasons would be appointed, and spacious plains consecrated for the assembling of ten thousands of "the sons of God," not for carnage and devastation, as when the warrior "mustereth the armies to the battle," but "to rehearse the mighty acts of the Lord," to exchange sentiments and feelings of affectionate regard, and to swell the song of triumph over sin and misery, with the harmony of human voices and musical instruments, in one loud chorus to the skies. Then the name of Jehovah would be One throughout all the earth. "All his works would praise him, and his saints would bless him. They would abundantly utter the memory of his great goodness, they would speak of the glorious honour of his majesty, and sing of his righteousness."

Among all ranks of men cordial submission to the will of God, and contentment under the arrangements of his providence would be uniformly manifested. Every one would consider the situation in which Providence had placed him as the best possible for promoting his present improvement and his future felicity, viewing it as the allotment of infinite wisdom and benevolence. In adversity he would sustain his afflictions with patience, and derive from them "the peaceable fruits of righteousness." In prosperity he would acknowledge God as the source of all his enjoyments, and devote the wealth and influence he possessed to the promotion of religion, and the best interests of his fellow-men. By day, and by night, and at every returning season, the overflowings of gratitude, in every heart, would burst forth in songs of thanksgiving to the Giver of all good. Every comfort would be recognized as "coming down from the Father of lights," and every pleasing sensation produced by the scenery of nature, as the result of his wisdom and beneficence. His wonderful works, which are now overlooked, or gazed at with apathy by nine-tenths of the inhabitants of the globe, would be contemplated with enlightened understandings, and with emotions of reverence, admiration, and delight. The majestic movements of the planetary orbs, the glories of the starry sky, the light beaming from a thousand suns through the immeasurable voids of space, the

mighty ocean with all its wonders, the numerous rivers rolling into its abyss, the lofty ranges of mountains which encircle the earth, the treasures of the fields, the riches of the mines, the beauties which adorn the hills and plains, the wonders of the atmosphere, the admirable structure and economy of the numerous tribes of animated beings,—these, and thousands of other objects, considered as manifestations of the attributes of Deity, would supply topics of conversation in every social circle, on which every heart would dwell with increasing delight. "They would speak of the glory of his kingdom, and talk of his power, to make known to the sons of men his mighty acts, and the glorious majesty of his kingdom." The work of human redemption, in its origin and progress, in its connexions and bearings, in the lustre it reflects on the perfections of the Deity, in its relation to the angelic tribes, and in its glorious and happy consequences on thousands of millions of human beings throughout an eternal round of existence—the person of the Redeemer, his amiable character, his grace and condescension, and the glories of his exalted state—the joys of departed saints, the general resurrection, with all its solemn and transporting scenes, the new heavens and the new earth, and the boundless scene of grandeur and felicity which will open to the view when death shall be swallowed up in victory, and all things subjected to the moral order of the universe, would afford subjects of sublime contemplation, and themes for social converse, on which enlightened and renovated minds would expatiate with ever-growing improvement and ever-growing pleasures.

The providential dispensations of God towards the human race, would form another subject of investigation, which would be prosecuted with feelings of astonishment, admiration, and reverence. The history of all nations would be carefully perused—not for the purpose of admiring the exploits of mighty conquerors and barbarous heroes, and feasting the imagination on spectacles of human slaughter and devastation—but for exciting abhorrence of those depraved passions which had drenched the earth with blood—for drawing forth the tear of pity over the graves of slaughtered nations—for stimulating the exercise of those holy affections which restored peace and tranquillity to the world—for acquiring a display of the rectitude of the moral character of God, and the equity of his administration among the nations—for tracing the accomplishment of divine predictions—for illustrating the long-suffering and forbearance of God, and for exciting admiration of that inscrutable wisdom by which the whole train of events was conducted, so as to set restraining bounds to the wrath of man, and to make it subservient to the introduction of the reign of happiness and peace. In all the revolutions of past ages, and

in all the events that daily passed in review before them, they would uniformly recognize the agency and the purposes of that Almighty Being "who doth according to his will in the armies of heaven, and among the inhabitants of the earth," and who is carrying forward all the plans of his government to a glorious consummation.

Every useful invention, every new instrument for investigating the operations of nature, every new discovery in the earth, or in the heavens, every exploration of an unknown region of the globe, every branch of commerce and manufacture, every new mode of facilitating labour and improving the productions of the soil; every improvement in the ease and rapidity of travelling, and of conveying intelligence from one region to another, and every art and science, would be consecrated, in some form or other, to the service of God, and to the accomplishment of the objects of general benevolence. One grand diffusive principle, manifesting itself in numberless ramifications, would pervade the whole mass of society; and one grand aim, the honour and glory of the Creator, and the universal diffusion of happiness in every direction, and among every rank of sentient and intelligent beings, would be the unceasing endeavour of men of all nations, and kindreds, and languages. The whole mass of this world's inhabitants would appear like one vast celestial army marching forward in harmony to the regions of bliss, every one, in his appointed order, passing in peace and tranquillity through the gates of death, to join the general assembly above, and to augment and enliven the congregation of the heavens.

On such a world the God of heaven would look down with complacency, and his providential care would be exercised in averting those physical evils which now increase the moral wretchedness of mankind. His eye would be continually upon them for good, and his ear would be ever open to their requests. Then that glorious scene presented to the view of the apostle John, would be fully realized,—“Behold the tabernacle of God is with men, and he will dwell with them; and they shall be his people, and God himself shall be with them, and be their God. And God shall wipe away all tears from their eyes, and there shall be no more curse, neither sorrow nor crying, neither shall there be any more pain; for the former things have passed away.” To such a world celestial messengers would rejoice to wing their downward flight, on messages of love. Their visits, which have been “few, and far between,” and which have been long interrupted by the malevolence of men, would be again resumed; and those “morning stars” that shouted for joy when this fair creation arose into existence, would be filled with unutterable delight when they beheld moral order restored, and the smiles

of universal love irradiating the inhabitants of our globe, and would shout even with more ecstatic joy than they did before, “Glory to God in the highest, peace on earth, and good will among men!”

Alas! such a picture as that which we have now faintly sketched, has never yet been realized in the moral aspect of the inhabitants of this world. To the eye of an angelic intelligence, while he hovers over our globe in his flight through the planetary regions, nothing appears but a vast cloud of moral darkness and depravity, with here and there only a few faint radiations of truth and love emerging from the general gloom. He beholds throughout the whole extent of Africa, from the shores of Barbary and Egypt to the Cape of Good Hope—throughout the vast regions of Asia and its numerous islands, and throughout four-fifths of the continent of America, little else than one wide scene of moral desolation, where idolatry and superstition, tyranny and ambition, treachery and cruelty, war and dissension, reign triumphant among almost every tribe; and where scarcely a ray of divine light and divine love gilds the horizon, from the one end of these extensive regions to the other. Even in Europe, where the light of science and of revelation is converged to a focus, what an immense cloud of moral darkness still appears enveloping its population? The fields of Waterloo, of Leipsic, of Borodina, and of Smolensko, where so many thousands of human beings were sacrificed to the demon of war—the vales of Switzerland and Hungary, the plains of France and Italy, the anarchy and commotions of Spain and Portugal, and the ensanguined shores of Turkey and Greece, where massacres have been perpetrated with the rage and fury of infernal demons, bear witness to the melancholy fact, that hatred and malignity still hold the ascendancy over the nations of Europe, and over all the efforts of benevolence and love.

But, we trust, that the period is fast approaching, when the breath of a new spirit shall pervade the inhabitants of every clime, and when holy love shall unite all the tribes of mankind in one harmonious society. When the messengers of the Prince of Peace “shall run to and fro” from the north to the south, and from the rising to the setting sun: when the sound of the gospel-trumpet shall re-echo throughout every land; when the light of divine revelation shall diffuse its radiance on the benighted nations; when its sublime doctrines and moral requisitions shall be fully understood and recognized in all their practical bearings, and when the energy of that Almighty spirit which reduced to light and order the dark and shapeless chaos, shall be exerted on the depraved and benighted minds of the mass of this world's population—then the death-like slumber which has seized upon the race of Adam shall be broken; the dead in

treasures and sins shall awake to new life and activity; this bedlam of the universe will be restored to reason and intellectual freedom, and to the society of angelic messengers, and the face of the moral creation will be renewed after the image of its maker. Then wars shall cease to the ends of the earth, and anarchy and dissension shall convulse the nations no more; violence will no more be heard in any land, "liberty will be proclaimed to the captives, and the opening of the prison-doors to them that are bound." The spirit of malevolence will be vanquished, its power will be broken, and its operations demolished. The order and beauty of the celestial system will be restored. "Holiness to the Lord" will be inscribed on all the implements and employments of mankind. Kindness and compassion will form the amiable characteristic of every rank of social life. Love will spread her benignant wings over the globe, and reign uncontrolled in the hearts of all its inhabitants. For thus saith the voice of Him who sits on the throne of the universe, "Behold I make all things new—I create new heavens and a new earth, and the former shall not be remembered, nor come into mind. Be ye glad, and rejoice for ever in that which I create; for behold, I create Jerusalem a rejoicing, and her people a joy, and the voice of weeping shall be no more heard in her, nor the voice of crying."

## SECTION VI.

### UNIVERSALITY OF THE PRINCIPLES OF LOVE TO GOD, AND TO FELLOW-INTELLIGENCES.

THE grand principles of morality to which I have now adverted, are not to be viewed as confined merely to the inhabitants of our globe, but as extending to all intellectual beings. They form the basis of the moral laws, which govern all intelligences throughout the vast universe, in whatever world or region of infinite space they may have their physical residence; and they constitute the bond which unites to the supreme intelligence, and to one another, all holy beings, wherever existing in the wide empire of Omnipotence. This will at once appear, if we reflect for a moment, on what has been stated in the preceding sections. We have seen, that, if those laws or principles were reversed, and were the moral agents of our world to act accordingly, nothing would ensue, but anarchy, wretchedness, horror, and devastation, and ultimately a complete extermination of the race of mankind. And by parity of reason, it will follow, that were the same principles to operate in any other world, however different the capacities, relations, and physical circumstances of its inhabitants might be, similar disastrous effects would be the inevi-

table result; and were they to pervade all worlds, disorder and misery would reign uncontrolled throughout the whole intelligent system.

When the Creator brought any particular world into existence, and peopled it with inhabitants, we must suppose, that the laws to which I am now adverting, were either formally addressed to them by some external revelation, or so powerfully impressed upon their moral constitution, as to become the main-spring of all their actions, so long as they might retain the original principles implanted in their minds by the Author of their existence. Any other supposition would be fraught with the most absurd and horrible consequences. It would be subversive of every idea we are led to form of the character of the Divine Being, inconsistent with the perfect benevolence and rectitude of his nature, and incompatible with the relations in which rational beings stand to Him and to one another, and with the harmony and happiness of the universe, to suppose, that any creatures now exist, or ever can exist, to whom such commands as these would be given,—"*Thou shalt hate thy Creator, who is the source of thine existence;*" and "*Thou shalt hate all thy fellow-intelligences with whom thou mayst associate.*" And if the mind would recoil with horror, at the idea of such laws issuing forth from the throne of the Eternal to any class of moral agents, it must necessarily be admitted, that the opposite principles or laws, to which I allude, are promulgated to all intelligences, and are obligatory on every inhabitant of all the worlds which lie between the range of Jehovah's empire. The natural scenery with which the inhabitants of other worlds are surrounded, the organization of their corporeal frames, the intellectual capacities with which they are endowed, the stated employments in which they engage, and the relations in which they stand to each other, may be very different from those which obtain in our terrestrial sphere, but the grand principles to which I refer, must necessarily pervade every faculty of their minds, every active exertion, and every relation that subsists among them, by whatever character it may be distinguished, if they be found existing in a state of happiness.

The moral code of laws in other worlds may be somewhat differently modified from ours, according to the circumstances in which the inhabitants of each respective world are placed, and the relations which obtain among them; but the same general principles will run through every ramification of their moral precepts, and appear in the minutest actions they perform, as the sap which proceeds from the trunk of a tree diffuses itself among the minutest and the most distant branches. The seventh commandment of our moral code can have no place in a world where the inhabitants "*neither marry nor are given in marriage;*" where the succession of intelligent beings is not

carried on by any process analogous to human generation, where death is unknown, and where rational agents have a fixed and permanent abode. The *fifth* precept of our law cannot be recognized in a world where the relations of parents and children, princes and subjects, superiors and inferiors, have no existence. And in those worlds where the bounties of Divine Providence are equally enjoyed by all, or where external comforts are not necessary for the happiness of the individual, as in our world, or where the slightest temptation to interfere with the property of another does not exist, there will be no necessity for a distinct moral regulation corresponding to the *eighth* commandment of our moral code.—But in every world where happiness exists, and where the inhabitants have retained their original integrity, love to God, and love to all subordinate intelligences with which they are connected, will animate every heart, regulate every desire, and run through every action. And in those worlds (if any such exist besides our own) where these principles are counteracted, or not recognized as the foundation of moral action, misery and disorder, in a greater or less degree, must be the inevitable consequence.

The greater part, however, of the precepts comprised in the moral law given to man, must be considered as obligatory upon all the rational inhabitants of the universe. The *first* commandment, which forbids the recognition of any object of adoration, or of supreme affection, besides the eternal Jehovah—the *second*, which forbids the representation of this incomprehensible Being by any visible or material objects—the *third*, which enjoins reverence of the name or attributes of God—and the spirit of the *fourth*, which enjoins a certain portion of duration to be set apart for solemn acts of worship and adoration, are applicable to all the moral agents that Jehovah has created. The *sixth* commandment, which forbids malice, revenge, and injurious actions of every description—the *ninth*, which forbids falsehood, and inculcates *truth*, which is the basis of the moral universe—and the *tenth*, which forbids envy, and every unhallowed desire to deprive our neighbour of any portion of his happiness—are also binding upon every class of moral intelligences, wherever existing, throughout the unlimited empire of God. For, if we suppose any one of these precepts to be reversed, and moral agents to act on the principle of this subversion, their moral order and harmony would be interrupted, and consequently, their happiness destroyed.—For example, let the law, which inculcates truth, be supposed to be universally violated among any class of rational beings, and instantly all improvement in wisdom and knowledge would cease; nothing could be depended upon as fact but what was obvious to the senses of every individual; social compacts would be dissolved; a mutual repulsion would ensue, and every social

affection and enjoyment would be unhinged and destroyed.

By overlooking considerations of this kind, the celebrated Dr. Chalmers, in his “Discourses on the Christian Revelation viewed in connexion with Modern Astronomy,” deprived himself of an important argument to prove that Christianity is not confined to this sublunary region. For, as it is the great object of the Christian Revelation to bring into full effect, in all their practical bearings, the principles I have been endeavouring to illustrate, and as these principles must be interwoven with the moral code of all worlds—it follows, that the spirit and essence of our religion must be common to all the holy inhabitants of the universe.

From what has been now stated respecting the universality of the principle of love, the following conclusions may be deduced:—

1. That the man in whose heart this principle is predominant, and whose actions are directed by its influence, is qualified for associating with the pure intelligences of all worlds. Were we transported to the surface of the planet Jupiter, and had we access to mingle with its vast population; or were we conveyed to one of the planets which revolve around the star *Sirius*—if the inhabitants of these globes have retained the primeval purity of their natures, and if the principle of love reigned supreme in our hearts, we should be assured of a welcome reception from those distant intelligences, and be qualified to mingle with them in their adorations of our common Creator, and in all their affectionate and harmonious intercourses. We should only have to learn the mode by which they communicate to each other their ideas and emotions. Love would form the basis of every union, and amalgamate us with every department of their society. With pleasure, and with the most endearing affection, would they point out to us the peculiar glories of the world they inhabit, and rehearse the history of the Creator’s dispensations in that portion of his empire; and with equal pleasure should we listen to the instructions which flow from the lips of Benevolence, and survey those transporting objects and arrangements which decorate a world where love pervades the breasts of all its inhabitants. To visit a distant world, although it were in our power, where the inhabitants were of an opposite description, could afford no gratification to an intelligent and benevolent mind, but would overwhelm it with anguish and dismay. What enjoyment would the capacious mind of a pure intelligence from the regions of the constellation *Orion*, derive from visiting a world inhabited by such beings as the inhabitants of Nootka Sound, New Guinea, or New Zealand, where the moral and intellectual principle is completely debased, and where the beauties of Nature are defaced with interminable forests and marshes, and the haunts of beasts of prey? He

could be filled with disappointment and horror—we might drop a tear of pity over the wretched inhabitants, but he would soon wing his flight back to a more delectable region. A similar disappointment would be felt, were an inhabitant of our world, in whose mind hatred and cruelty, avarice and ambition, reigned without control—to be conveyed to a world of happiness and love. The novel scenes of beauty and grandeur, which would burst upon his sight, might captivate his senses for a little: but he would feel no enjoyment in the exercise of virtuous affections and rapturous adorations, to which he was never accustomed; he would find no objects on which to gratify his cruel and ambitious desires, and he would be glad to escape from the abodes of affection and bliss, to the depraved society from whence he came. Hence we may learn, that, however expansive views we may have acquired of the range of the Creator's operations, and of the immensity of worlds which are diffused through boundless space, and however ardent desires we may indulge of visiting the distant regions of creation, we never can indulge a rational hope of enjoying such a privilege, were it possible, unless love to God and to man become the predominant disposition of our minds. For, although we were invested by the Almighty with corporeal vehicles, capable of transporting us from one region of creation to another, with the most rapid motion, we could enjoy no solid satisfaction, while we remained unqualified for relishing the exercises, and mingling in the associations of holy intelligences. In every happy world on which we alighted, we should feel ourselves in a situation similar to that of a rude and ignorant boor, were he conveyed to a palace, and introduced into an assembly of courtiers and princes.

2. Another conclusion deducible from this subject is, that by virtue of this grand and governing principle, man is connected with the highest order of intelligences, and with the inhabitants of the most distant worlds; and his happiness perpetually secured. When we take a view of the universe by the light of modern science, our minds are overpowered and confounded at the idea of its vast and unlimited range. When we consider that it would require several millions of years for a cannon ball, flying at the rate of five hundred miles an hour, to reach the nearest stars—when we consider that there are stars visible to the naked eye, at least fifty times farther distant than these—when we consider that there are stars visible by the telescope a thousand times farther distant than any of the former—and when we consider that all the suns and worlds which lie within this unfathomable range are, in all probability, only as a grain of sand to the whole earth, when compared with the immensity of systems which lie beyond them in the unexplored abysses of infinite

space,—we are lost in the immensity of creation, and can set no bounds to the empire of the Almighty Sovereign. When we look forward to that eternal state to which we are destined—when we consider that after thousands of millions of centuries have run their rounds, eternity will be no nearer to a termination, and that ages, numerous as the drops of the ocean, will still roll on in interminable succession,—we behold a lapse of duration, and a succession of events stretching out before us, which correspond with the immeasurable spaces of the universe, and the number and magnitude of the worlds with which it is stored. When we view ourselves as thus connected with the immensity of creation on the one hand, and with infinite duration on the other; and when we reflect on the numerous changes that have happened, both in the physical and moral aspect of our globe, within the period of six thousand years, we cannot but conclude that we are destined to pass through new scenes and changes in that eternity which lies before us, of which at present we can form no conception. After remaining for thousands of millions of years in that world which will be prepared for the righteous at the general resurrection, we may be transported to another system as far distant from that abode as we now are from the most distant stars visible to our sight, in order to contemplate new displays of the attributes of God, in another province of his empire. We may afterwards be conveyed to an unoccupied region of immensity, where new creations, displaying new objects of glory and magnificence, are starting into existence. We may afterwards be invested with the wings of a seraph, and be enabled to wing our way, in company with angels, from world to world, and to visit the most distant regions of that immense universe over which Omnipotence presides. In short, the imagination can set no limits to its excursions, when it attempts to survey the revolutions and changes that may take place, and the new scenes of glory which may burst upon the view, throughout the lapse of duration which will have no end.

Now, in whatever relation man may stand to any portion of the universal system, throughout every future period of his existence, and during all the revolutions of eternity, love will unite him to all other holy beings with whom he may associate, however distant their abode from the spot he now occupies, however different its scenery and arrangements, and however superior they may be in point of corporeal organization and intellectual capacity. For no intelligence, in any region of the universe, in whom the principle of love predominates, can ever be supposed to disdain to associate with another, of whatever rank or order, who is actuated by a similar affection; otherwise his love would degenerate into malevolence. This principle will unite him to

angels and archangels, to cherubim and seraphim, to thrones, dominions, principalities, and powers, from whose discourses he will learn the history of the divine dispensations, the wonders of Almighty power, and the "manifold wisdom of God." So long as it reigns uncontrolled in his heart, it will secure his happiness in all places, and in every period of his existence, by a law established by the Almighty, and founded on his perfections; a law which binds together the whole intelligent system, and forms the basis of the felicity of the moral universe. So that his future blessedness is for ever secure, beyond the reach of danger, and rests upon a foundation stable and permanent as the throne of the Eternal.

3. From what has been now stated, we may learn that *there is but one religion throughout the universe*, however vast its magnitude and boundless its extension. In this world, numerous systems of religion prevail, and thousands of different opinions in relation to its ceremonies and objects; but experience has demonstrated, that all of them, except one, are insufficient to guide rational beings to substantial felicity. And of this one system, how many foolish and inaccurate, and even contradictory opinions, have been formed, through the ignorance and perversity of the human mind! Though all its parts have a direct reference to the actions of intelligent agents, and to the cultivation of benevolent affections, yet it has been represented, even by its professed abettors, as a congeries of metaphysical dogmas and speculative opinions; and in this point of view it has been the source of perpetual wrangling and contentions. Though it is calculated to expand the understanding, to warm the heart, and to elevate the soul to God, yet it has been reduced, by the cunning artifice of man, to a mass of mere quibbles and unmeaning ceremonies. And though it breathes nothing but peace and good-will to man, it has been employed as an engine of persecution and of human destruction. It is only in proportion as our religion approximates to the character of the religion which is common to all holy beings, that it is worthy of our veneration and our ardent pursuit. And therefore, in order to determine the truth and importance of any particular system of religious opinions, the best test we can apply to it is, to ascertain what bearings it has upon the grand principles to which we have been adverting. "Do all the sentiments and tenets which it strenuously supports, like the lines from the circumference to the centre of a circle, converge towards the promotion of love in all its practical ramifications? Are the opinions we now so fiercely maintain of such a nature, that we shall probably recognize them as important practical principles a million of years hence, in the regions of distant worlds?" If such a test were applied to hundreds of opinions which have

agitated the religious world, and obstructed the operations of the benevolent affections, they would be driven away from the Christian system as chaff before the whirlwind; and Christians would feel ashamed of the importance they attached to their "mint, and anise, and cummin," while they neglected the weightier matters of the law, "judgment, mercy, and the love of God." How many false and foolish opinions shall we leave behind us in this region of darkness and contention, when we enter within the confines of the eternal state? How sublime, how lovely, and how beautifying will religion appear in that world, where it will be contemplated in its native simplicity, and stripped of all the foreign and adventitious circumstances which now obscure its brightness and glory! I need scarcely say, that the one religion to which I allude is *Christianity*, considered, not so much in the scheme of mediation which it unfolds, which may have a relation solely to man viewed in his character as a sinner, but in the *leading dispositions and virtues* it inculcates, and in the *great objects* which all its doctrines, facts, and supernatural communications have a tendency to accomplish. In these points of view, it must be considered as embodying principles and laws which pervade the religious systems of all worlds.

Finally, Love is a principle in the moral and intelligent system which bears a striking analogy to the principle of attraction in the material world. Each of them unites, in its respective sphere, all the beings which compose it in one grand and harmonious system; and both of them combined give birth to all the moral and physical phenomena which diversify the intellectual and the material universe. By the principle of attraction, the inhabitants of the earth, along with their habitations, are retained to its surface, and prevented from flying off in wild confusion through the voids of space. By the same power the mountains rest on a solid basis, the rivers flow from the mountains to the plains, and the ocean is confined within its appointed channels. It produces the various phenomena which arise from the meandering rill, the majestic river, and the roaring cataract. It produces the descent of rain and dew, and the alternate flux and reflux of the tides. It prevents the waters of the great deep from covering the mountain-tops, and mingling in confusion with the clouds of heaven. It binds together the infinity of atoms which constitute the globe on which we tread; it regulates the various movements of men and other animated beings; it forms mechanical powers, and gives impulsion to numerous machines and engines. It rolls the moon in regular succession around the earth, and prevents her from running lawlessly through the sky. It extends its influence from the sun to the remotest planets, conducting revolving worlds, with all their satellites in their ample circuits, and preserving them all

in one harmonious system. It connects the earth and the planetary globes with other systems in the distant regions of space; and carries the sun, with all his attendant orbs, around the centre of that nebula to which it belongs, and all the systems and nebulae of the universe around the throne of God.

In like manner, love unites all holy intelligences, wherever dispersed through the amplitudes of creation, in one amiable and harmonious system. It unites man to God, and God to man. It unites the renovated inhabitants of our globe to angels and archangels, and qualifies them for entering into the closest bonds of friendship and affection with superior intelligences that people the regions of distant worlds. It produces an expansive and harmonious spirit, and an ardent desire to diffuse happiness among all surrounding beings. It gives birth to those sublime emotions which flow out towards the Creator in the various forms of adoration, complacency, hope, confidence, humility, joy, submission, and reverence; and it is the spring of all those virtuous dispositions which flow out towards our fellow-creatures in the form of mercy, compassion, sincerity, candour, sympathy, kindness, long-suffering, gentleness, meekness, charity, generosity, justice, and active beneficence. It impels its possessor to run to the assistance of the distressed, to support the weak, to console the desponding, to comfort the dying, to diffuse the rays of heavenly light over the benighted mind, and to rejoice in the prosperity of all around. It is "the bond of perfection" which unites the members of an affectionate family, and preserves the union of the faithful in all the churches of the saints. It unites man to man by the closest ties, however different in language, customs, colour, and complexion, and however far removed from each other in point of place. It enables the Greenlander, the Icelander, the African, the inhabitant of Hindostan, and the inhabitant of the British Isles, in whose hearts it resides, to recognize each other as "the sons of God," and as "brethren in Christ Jesus." It sends forth the imagination over every quarter of the globe, carrying benevolent wishes, fervent prayers, and intercessions for men of all kindreds and ranks; and employs every active endeavour to promote the present enjoyment and the eternal felicity of the family of mankind. It inspires the soul with emotions of delight, when it becomes the instrument of communicating happiness to all within the sphere of its influence. It unites the host of seraphim and cherubim in one vast and harmonious association; so that no jarring affection is ever felt, and no discordant voice is ever heard, among the thousands and ten thousands of these exalted intelligences. It preserves every member of the holy and intelligent system in the rank and orbit prescribed by Infinite Wisdom, and leads them all to

rejoice in accomplishing the plans of their benevolent Creator. Around him, as the sun of the moral system—the centre of light, and love, and joy—they all revolve in their appointed order, cheered by the emanation of his love, enlightened by his beams, and reflecting a radiance upon all the beings with which they are surrounded. Though one orb differs from another in motion, in magnitude, and in glory, yet no one interferes with another to impede its progress, or to intercept the emanations of light and joy from the Uncreated Source and Centre of all enjoyment.

Were the principle of attraction which binds together the atoms of our globe, and connects the planetary orbs with the sun, to be completely dissolved, the earth would be shattered to its centre; the waters of the ocean would fly upwards, and be dispersed through the highest regions of the atmosphere; rocks and mountains would be detached from their bases, and raised aloft above the clouds; forests would be torn up from their roots, and tossed about in confusion through the sky; the moon would forsake her ancient course; the planets would run lawlessly through the immensity of space, and mighty worlds would be seen dashing against each other, till they were shattered to pieces, and their fragments tossed about in disorder throughout surrounding systems. Effects equally disastrous to the intelligent system would be produced, were the influence of love, in all its varied emanations, to be completely suspended or annihilated. War would be proclaimed in heaven, and myriads of angels hurled from their seats of bliss. The rapturous songs and adorations of seraphs would be changed into the howlings and execrations of demons. The population of the universe would be transformed into one vast assemblage of fiends; its regions of beauty and fertility would become one wide scene of desolation and horror, and the voice of lamentation and misery would be heard resounding throughout all worlds. On earth kingdoms would be shaken and convulsed; governments overturned; societies dissolved; families dispersed; the bonds of friendship burst asunder; husbands torn from their wives, and parents from their children; the intercourse of nations suspended; the pursuits of science and religion abandoned; every rank and relation overturned, and virtue banished from the abodes of men. Deserting all social beings, and forsaken by all, man would become a solitary monster, wandering without plan or object, an enemy to himself and to his species. Anarchy and disorder would reign triumphant over the whole race of human beings, and the howlings of wretchedness and despair would re-echo from every land.

Such a scene of moral desolation *selfishness* and *malignity* have a natural tendency to create; and such a scene they have actually created in our world, in so far as their influence has extended. The power of attraction has never been com-

pletely suspended in relation to our globe, nor has the moral Governor of the universe suffered the principle of love to be entirely eradicated from the minds of its inhabitants. But, as when the law of gravitation is counteracted in case of earthquakes and volcanoes, the most destructive and desolating convulsions ensue,—so it happens in the moral world, when the law of benevolence is trampled under foot. “Nation rises against nation, and kingdom against kingdom;” hostile armies encounter like tigers rushing on their prey; “firebrands, arrows, and death” are scattered in every direction; a confused noise of chariots, and horsemen, and of engines of destruction, is wafted on every breeze; garments are rolled in blood, and whole plains drenched with human gore, and covered with the carcasses of the slain. But wherever love diffuses its powerful and benign influence, there harmony, happiness, and peace are enjoyed by every rank of sensitive and intellectual existence. In every world where it reigns supreme, the intellectual faculty is irradiated, the affections are purified and expanded, transporting joys are felt, and, like the planetary orbs and their train of satellites, all shine with a steady lustre, and move onward in harmonious order, around the Supreme Source of Intelligence, and the Eternal Centre of all felicity.

## SECTION VII.

### THE PRECEDING VIEWS CORROBORATED BY DIVINE REVELATION.

IN the preceding sections I have endeavoured to illustrate the two grand principles of the Moral Law, and to demonstrate their reasonableness, and the necessity of their universal operation, in order to the promotion of the happiness of the intelligent system. I have proceeded all along on the ground of revelation, as well as of reason, and the nature of things. But since these important principles form the basis of the system of religion, and of all the practical conclusions I may afterwards deduce in the remaining part of this work, it may be expedient to advert a little more explicitly to the declarations of Scripture on this subject. And here I propose very briefly to show, that it is the great end of Divine Revelation to illustrate these principles in all their various bearings, and to bring them into practical operation.

This position is expressly stated by our Saviour himself, in his reply to the scribe, who proposed the question, “Which is the great commandment in the law?” “Thou shalt love the Lord thy God with all thy heart, and with all thy soul, and with all thy mind.” This is the first and great commandment. And the second is

like unto it; Thou shalt love thy neighbour as thyself. ON THESE TWO COMMANDMENTS HANG ALL THE LAW AND THE PROPHETS.” This declaration evidently implies, that it is the design of the whole of the Old Testament Revelation, to illustrate and enforce these laws, and to produce all those holy tempers which are comprised in the love of God, and of our neighbour. This appears to be the grand object of all the historical facts, religious institutions, devotional exercises, moral maxims, prophecies, exhortations, promises, and threatenings, which it records. The history of the formation of the universe, and of the beautiful arrangement of our globe, as detailed in the Book of Genesis, is calculated to display the wisdom and goodness of the Creator, and to draw forth our affections towards Him who is the Author of our enjoyments, and who pronounced every thing he had made to be “very good.” The history of the wickedness of the antediluvian world, of the dreadful effects it produced in the state of society, and of the awful catastrophe by which its inhabitants were swept from existence, and buried in the waters of the deluge, is calculated to illustrate, in the most striking manner, the guilt and the danger of withdrawing the affections from God, and of indulging a principle of malevolence towards man. The history of the crimes of Sodom, and of the fate of its wretched inhabitants; the destruction of Pharaoh and his armies at the Red Sea; the history of the idolatrous practices of the Israelites, of their murmurings in the wilderness, and of the punishments inflicted for their rebellion; the fate of Korah, Dathan, and Abiram, and of the worshippers of Baal: The destruction of the nations of Canaan; the judgments which pursued the Jewish nation, during the whole period of their history, on account of their defection from God, and the calamities which befell them at the period of the Babylonish captivity—together with all the other facts connected with the history of that people and of the surrounding nations, are intended to exhibit the dismal consequences, and the moral wretchedness which inevitably follow, when the affections of mankind are withdrawn from the God of Heaven, and left to grovel in the mire of depravity and vice.

The institutions of the Jewish Church were appointed for promoting the knowledge and the love of God, and for exciting an abhorrence of every thing which is contrary to the rectitude and purity of his nature. Among the tribes that inhabited the land of Canaan, prior to the entrance of the Israelites, and among all the surrounding nations, the worship of false gods, the grossest superstitions, and the most abominable vices universally prevailed. It was one great end of the laws and ceremonies enjoined upon Israel, to excite the highest degree of abhorrence at every thing which was connected with idolatry, to portray its wickedness and folly, to rivet

the affections of the people to the worship of the true God, to preserve them uncontaminated from the malignant disposition, and the vile practices of the neighbouring nations, and to instruct them in the nature and attributes of the Deity; that they might be "a peculiar people to Jehovah, separated from all the people that were on the face of the earth." Hence, the following intimation and injunction are placed on the front of the moral code of laws delivered to that nation, "Hear, O Israel, the Lord our God is one Lord Thou shalt have no other gods before me." To promote harmony and affection between man and man; to enforce the exercise of justice and equity in all their dealings; to inculcate chastity and purity of affection, kindness to strangers, compassion, tenderness, and sympathy; obedience to parents, charitable dispositions towards the poor and needy, and tenderness and mercy towards the inferior animals, were the great objects of the various laws and regulations comprised in their moral and political code.

The devotional portions of the Old Testament, particularly those contained in the book of Psalms, have the same general tendency. The descriptions of the work of creation and providence, the adorations of the majesty of the God of Israel, the celebration of the divine character and excellences, and the ascriptions of thanksgiving and praise for the mercy, long-suffering, and goodness of God, with which these divine compositions abound, are calculated to raise the affections to Jehovah as the source of every blessing, and to inspire the soul with love, admiration, and reverence. In many of these sublime odes, particularly in the 119th Psalm, the mind of the Psalmist is absorbed in meditation on the excellency of the divine precepts, and the happiness which the observance of them is calculated to convey to the soul. "O how I love thy law!" says David; "it is my meditation all the day. The law of thy mouth is better unto me than thousands of gold and silver. I have rejoiced in thy testimonies as much as in all riches." The moral maxims contained in the writings of Solomon are likewise intended to draw forth the desires after God, to counteract the influence of the depraved passions of the human heart, and to promote the exercise of candour, sincerity, justice, and benevolence among mankind. The exhortations, remonstrances, and denunciations of the prophets, were also intended to recall the affections of the people of Israel to the God from whom they had revolted, to show the unreasonableness of their conduct in "forsaking the fountain" of their happiness; to display the purity, the excellence, and the eternal obligation of the divine precepts, and to warn them of the inevitable misery and ruin which will overtake the workers of iniquity. In short, all the promises and threatenings of the word of God, all the considerations addressed to the hopes and the fears of

men, all the providential dispensations of God, all the manifestations of the divine character and perfections, and all the descriptions of the glories of heaven, and of the terrors of hell, have a tendency to illustrate the indispensable obligation of love to God, and love to all mankind, in order to secure our present comfort and eternal felicity.

And, as it was the main design of the Old Testament economy to illustrate and enforce the principle of love to God and to man, so it is, in a particular manner, the great object of the Christian Revelation, to exhibit the law of love in all its bearings and practical applications. In one of the first sermons delivered by our Saviour, and the longest one recorded in the Evangelical History, the Sermon on the Mount, the main design is to explain and enforce these principles, in relation both to God and to man, and to sweep away all the false glosses which Ignorance and Prejudice had mingled with their interpretations of the Divine Law. In one part of this discourse, our Lord declares, that we may as soon expect to see "heaven and earth pass away," or the whole frame of the universe dissolved, as that "one jot or one tittle shall pass from the law." For, as it is a law founded on the nature of God, it must be of eternal obligation, and can never be abrogated with regard to any class of rational beings, in consistency with the perfections of the divine nature. As it is a law absolutely perfect, comprehending within its range every disposition and affection, and every duty which is requisite for promoting the order and happiness of intelligent agents, nothing can be taken from it without destroying its perfection; and nothing can be added to it without supposing that it was originally imperfect. And as it was intended to preserve the harmony and to secure the felicity of the intellectual beings that people the earth and the heavens, the fabric of universal nature must be destroyed, before this law can be set aside or cancelled. For we have already seen, (Sect. IV.) that, were it reversed, the whole intelligent system would be transformed into a scene of confusion, misery, and horror. For the purpose of affording an immense theatre, on which the operations of this law might be displayed, the earth with all its furniture and decorations, and the heavens, with all their hosts, were called into existence; and, therefore, were it either cancelled or reversed, neither the glory of the Creator would be displayed, nor the happiness of his intelligent creation secured. The mighty expanse of the universe, enclosing so many spacious worlds, would become one boundless moral desert, in which no "fruits of righteousness" would appear, nor any trace of the beauty and benevolence of the Eternal Mind. —In the same discourse, our Saviour enforces the duty of love towards even our most bitter enemies and most furious persecutors. "Ye have heard that it hath been said, Thou shalt

love thy neighbour, and hate thine enemy. But I say unto you, Love your enemies; bless them that curse you; do good to them that hate you; and pray for them that despitefully use you, and persecute you; that you may be the children of your Father who is in heaven; for he maketh his sun to arise on the evil and on the good, and sendeth rain on the just and on the unjust." This is one of the most sublime exercises of the principle of love, in reference to our fellow-men; and it is enforced from the most sublime motive and consideration—the conduct of Benevolence itself towards a race of rebellious and ungrateful creatures.

All the other instructions of this Divine Teacher—his parables, exhortations, admonitions, warnings, and consolatory addresses, though referring to particular cases and circumstances—had the same general object in view. When his disciples would have called for fire from heaven, to consume the Samaritans, he kindly, but with energy and decision, reminded them, that a principle of malignity was imbodyed in their unhalloved desires, which is directly opposed to the law of love. "Ye know not what manner of spirit ye are of; for the Son of man is not come to destroy men's lives, but to save them." Among his last instructions to his followers, when he was about to depart from the scene of his earthly pilgrimage, love was the grand theme on which he repeatedly expatiated. "A new commandment give I unto you, that ye love one another; as I have loved you, that ye also love one another. By this shall all men know that ye are my disciples, if ye have love one to another." "These things I command you, that ye love one another."

And, as the promotion of the spirit of love was the great object of his instructions, so his whole life was an uninterrupted exemplification of the purest *benevolence*, both towards friends and towards enemies. Never did that holy affection which unites the angelic tribes, and diffuses joy among the poor inhabitants of all worlds, appear within the confines of our world, so amiable, so disinterested, and so ardent, as during the period of the public ministry of Jesus, and particularly towards the close of his earthly career. In the immediate prospect of sufferings, dreadful beyond our conceptions, his love to mankind was "strong as death," which the many waters of affliction which surrounded him were unable to quench. His whole soul seemed to be absorbed in affection towards his disconsolate disciples, and in a desire to cheer and animate their drooping spirits. His last addresses, as recorded by the Evangelist John, breathe a spirit of tenderness and compassion, and of Divine benignity, of which we have no parallel in the annals of our race."

To display his kindness and condescension, and to teach his disciples to perform with cheerfulness the humblest offices of friendship, he rose

from supper; he laid aside his garments; he took a towel; he girded himself; he poured water into a bason; he began to wash the disciples' feet; and he wiped them with the towel wherewith he was girded. He then addressed them in such language as this:—"Let not your heart be troubled; in my Father's house are many mansions; I go to prepare a place for you. And, if I go and prepare a place for you, I will come again and receive you to myself; that where I am there ye may be also. I will not leave you comfortless; I will pray the Father, and he shall give you another comforter, even the Spirit of truth, which shall abide with you for ever. Whatsoever ye shall ask in my name, I will do it. Peace I leave with you; my peace I give unto you; not as the world giveth, give I unto you. Let not your heart be troubled, neither let it be afraid." In his last prayer, which accompanied these benedictions, the same ardent flow of affection burst from his benevolent heart—"Holy Father! keep, through thine own name, those whom thou hast given me, that they may be one as we are." But his love was not confined to the select few with whom he was surrounded at this interesting hour. His mental eye surveyed the various tribes which people this department of creation—it pierced through all the succeeding generations of mankind—and he embraced in his expansive affections the whole race of the faithful till the close of time. "Neither pray I for these alone; but for them also who shall believe on me through their word; that they all may be one, as thou, Father, art in me, and I in thee; that they also may be one in us." Even towards his bitterest enemies his benevolent emotions flowed out, in earnest supplications for their forgiveness. Neither "the floods of ungodly men," which compassed him, nor the torrents of abuse which were poured upon him while he was nailing to the cross, could overpower that heavenly flame which burned in his holy breast. In the midst of all the mockeries, insults, and indignities which he endured, when he was made "a spectacle to angels and to men," his affectionate desires ascended, with the smoke of the evening sacrifice, to the throne of God, in behalf of his murderers—"Father, forgive them; for they know not what they do." O, what a striking contrast is here presented, to those scenes of pride, malignity, and revenge, which have so long disgraced the race of Adam, and spread lamentation, and mourning, and terror, among families, societies, and nations! What a happy world would this become, were it peopled with such amiable characters, and were all who profess to be followers of Jesus, instead of contending about "questions which gender strife," to vie with each other in imitating his mild and benevolent spirit! Then Christianity would appear in its native lustre, and receive the homage due to its divine character: and the name of Je-

novah would soon be proclaimed throughout all the earth, and the joys of his salvation felt in every clime.

Again, it is one great end of the death of Christ to destroy the principle of malignity in the human heart, and to promote the operation of the law of love. "While we were enemies, (says the Apostle Paul,) we were reconciled to God by the death of his Son." "We are sanctified through the offering of the body of Jesus Christ once for all." "He loved us, and washed us from our sins in his own blood." "They who were enemies in their mind, and by wicked works, he reconciled in the body of his flesh through death, to present them holy and unblameable, and unreprouvable in his sight." Love to his heavenly Father, and love to mankind, impelled him to "humble himself, and to become obedient to death, even the death of the cross." And, in order that this divine principle might be kept alive, and form a bond of union among all his followers, he appointed an ordinance, consisting of sensible signs, in commemoration of his death, to be observed in all ages as a memorial of his love, and to remind his friends of the indispensable obligation under which they are laid to love one another. To promote the same benevolent design, he arose from the dead, ascended to heaven, sent down the Spirit of Holiness to abide in the Church, and now presides in the celestial world as "a Prince and a Saviour, to give repentance and the remission of sins."

And, as the instructions and the example of Jesus Christ were calculated to exhibit the principle of love in all its interesting aspects, and to promote its practical influence, so the preaching and the writings of his Apostles had the same important object in view, as the ultimate scope of all their ministrations. The one half of every epistle to the Christian churches is occupied in delineating the practical bearings of this holy affection. Like the lines which proceed from the centre to the circumference of a circle, the various radiations of Christian affection are traced from love, as the grand central point, and exhibited in all their benign influence on individuals, families, churches, and the diversified relations which subsist in civil and Christian society. "Above all things," says the Apostle, "put on love, which is the bond of perfection. Though we speak with the tongues of men and angels, and have not love, we are become as sounding brass, or a tinkling cymbal. And though we understand all mysteries, and all knowledge, and bestow all our goods to feed the poor, and have not love, it profiteth nothing. Love suffereth long, and is kind; love envieth not, vaunteth not itself, doth not behave itself unseemly, seeketh not her own, is not easily provoked, thinketh no evil. Prophecies shall fail, languages shall cease, earthly knowledge shall vanish away, but love *never faileth*." "Love worketh no ill to his

neighbour; therefore, love is the fulfilling of the law. All the law is comprehended in this saying, namely, Thou shalt love thy neighbour as thyself. The works of the flesh," or those which flow from a principle of malignity, "are these: fornication, uncleanness, idolatry, hatred, variance, emulations, wrath, strife, seditions, envyings, murders, revellings, and such like. But the fruit of the spirit is love, joy, peace, long-suffering, gentleness, goodness, fidelity, meekness, and temperance." "Let love be without dissimulation, and walk in love as Christ also hath loved us. Be kindly affectioned one toward another with brotherly love, in honour preferring one another. Distributing to the necessity of saints; given to hospitality. Bless them that persecute you? bless, and curse not. Rejoice with them that do rejoice, and weep with them that weep. Husbands, love your wives, even as Christ also loved the church; children, obey your parents in the Lord; fathers, provoke not your children to wrath, but bring them up in the nurture and admonition of the Lord. Servants, be obedient to your masters, with good will doing service as to the Lord, and not unto men; and ye masters, do the same thing unto them, forbearing threatening, knowing that your master also is in heaven." "Put on, as the elect of God, holy and beloved, bowels of mercies, kindness, humbleness of mind, meekness, long-suffering; forbearing one another in love, and forgiving one another, if any man have a quarrel against any; even as Christ forgave you, so also do ye."

Such is the general scope of the instructions which the apostles delivered, in all their communications to the Christian churches, whether composed of Jews or Gentiles. And, had it not been for the strong prejudices of the Jews, and the erroneous conceptions of the Gentiles, which the apostles had to combat, it is probable, that the whole of their epistles would have been solely occupied in delineating the practical effects of love to God, and to our brethren of mankind, and its glorious consequences in the future world. And, as it was the great aim of the apostles themselves, in their writings and personal administrations, to illustrate the numerous bearings of Christian love, so they gave solemn charges to their successors in the work of the ministry, to make all their instructions subservient to the promotion of the same important object. Almost the whole of the epistles addressed to Timothy and Titus, which relate to the duties and the objects of the Christian ministry, has a reference, not to the discussion of metaphysical questions in theology, which "are unprofitable and vain," but to the illustration and the inculcating of those practical duties which flow from the spirit of love, and to the counteracting of those proud, malignant, and speculative dispositions which are opposed to the meekness and benignity of the gospel of peace.

I might also have shown, by numerous quotations, that, in the general epistles of Peter, James, and John, the same grand object to which I have been adverting is steadily and uniformly kept in view. The first epistle of John is almost exclusively devoted to the illustration of the love of God and of man; and on this theme, in which his soul appears to be almost entirely absorbed, he expatiates with peculiar energy and delight: "We know that we have passed from death to life, because we love the brethren. He that loveth not his brother abideth in death. Whosoever hateth his brother is a murderer; and ye know that no murderer hath (the principle of) eternal life abiding in him. Behold, what manner of love the Father hath bestowed on us, that we should be called the sons of God! Beloved, let us love one another; for love is of God: and every one that loveth is born of God, and knoweth God. He that loveth not knoweth not God; for God is love. No man hath seen God at any time. If we love one another, God dwelleth in us, and his love is perfected in us. If any man say, I love God, and hateth his brother, he is a liar; for he that loveth not his brother, whom he hath seen, how can he love God, whom he hath not seen?" It is recorded, by some ancient authors, that when this apostle was grown old, and unable to preach, he used to be led to the church at Ephesus, and only to say these words to the people, *Little children, love one another.*" Such was the importance which this venerable apostle attached to love, as the grand and governing principle in the Christian system.

Finally, The procedure of the last judgment will be conducted on evidence, deduced from the manifestations of love. At that solemn period, when the present economy of Divine Providence shall come to a termination; when the elements shall melt with fervent heat, and the great globe on which we tread shall be wrapt in flames; when the archangel shall descend, and sound an alarm with "the trump of God;" when the graves shall open, and give forth their dead; and when all the generations of men, "both small and great," shall stand before the throne of God; the eternal destiny of all the millions of mankind will be unalterably determined, on the ground of the manifestations which have been given of the existence and the operation of the principle of love, and of the affections and conduct to which it is opposed. "When the Son of man shall come in his glory, and all the holy angels with him, then shall he sit upon the throne of his glory. And before him shall be assembled all nations. Then shall he say to them on his right hand, Come ye blessed of my Father, inherit the kingdom prepared for you from the foundation of the world. For I was an hungered, and ye gave me meat; I was thirsty, and ye gave me drink; I was a stranger, and ye took me in; naked, and ye clothed me; I was sick, and ye visited me;

I was in prison, and ye came unto me." And, though ye had no opportunity of performing these offices to me in person, yet, "inasmuch as ye did it to one of the least of these my brethren, ye did it unto me." "Then shall he also say to them on the left hand, Depart from me, ye cursed; for I was an hungered, and ye gave me no meat; I was thirsty, and ye gave me no drink; I was a stranger and ye took me not in; naked, and ye clothed me not; sick, and in prison, and ye visited me not. Verily, I say unto you, inasmuch as ye did it not to one of the least of these, ye did it not to me. And these shall go away into everlasting punishment, but the righteous into life eternal." For every one shall be rewarded according to his works.—Such is the importance which will be attached to the influence of this holy affection over the human mind, at that "day of dread, decision, and despair;" for it is quite obvious, that every action here specified in relation to the righteous, is an effect of the love of God and of man presiding in the heart, and, therefore, if we shall ultimately be found destitute of this holy principle, we cannot expect the reward of the faithful, nor "have boldness in the day of judgment."

Thus it appears that it is the great end of all the historical facts, the religious institutions, the devotional writings, the moral maxims, the instructions of the prophets, the warnings, exhortations, promises, and threatenings, comprised in the Jewish revelation, to illustrate and enforce the law of love in its references both to God and to man—that it is explained and illustrated in the various instructions delivered by our blessed Saviour, and enforced by his example—that its numerous bearings and modifications are displayed in the writings of all the apostles, and in their instructions to Christian teachers—and, that its existence in the heart, and its operation in active life, will form the decisive test of our character at the final judgment.

## SECTION VIII.

ON THE PRACTICAL OPERATION OF LOVE, AND THE VARIOUS MODES IN WHICH IT SHOULD BE DISPLAYED TOWARDS MANKIND.

WE have already seen, that love is a most noble and expansive affection. It is not like a blazing meteor which dazzles the eye for a few moments, and then vanishes from the sight. It does not consist merely in a few transient emotions, and fruitless wishes for the good of others. It does not waste its energies in eloquent harangues on the beauty of virtue, in theorizing speculations on the principles of morals, in framing Quixotic schemes of philanthropy, or in weeping over tales of fictitious woe. It is a substantial and an ever active principle; its energies are exerted for the purpose of communicating happiness

to every rank of sensitive and intellectual beings ; and the moral world, as it actually exists, is the grand theatre of its operations. I have already endeavoured to illustrate some of the modifications of this affection, in its relation to God ;\* and, in the preceding sections of this chapter, have occasionally adverted to some of its benignant effects in reference to man. It may, however, be expedient, in this place, to enter a little more explicitly into the practical operations of benevolence, and the various modes by which its influence may be manifested in relation to our brethren of mankind.

The grand object which love proposes to accomplish is the communication of happiness. And, in order to stimulate and direct us in its operations, the character and agency of God are set before us as our exemplar. There is not a more amiable, attractive, nor comprehensive idea of the Divine Being any where to be found than that which is exhibited by the Apostle John, in three words—**GOD IS LOVE**. He is the eternal, uncreated Source of felicity, from which flow all those streams of joy which gladden the hearts of angels and archangels, cherubim and seraphim ; and whatever portion of happiness, sensitive or intellectual, is enjoyed by man on earth, and by all the subordinate tribes of animated nature, is derived from the same inexhaustible fountain. For the purpose of communicating happiness, he called the material universe into existence, to serve as an immense theatre, on which his benevolence might be displayed to countless orders of sensitive and intelligent creatures ; and all the perfections of his nature may be considered as so many agents employed for the execution of this noble design. Impelled, as it were, by this essential and characteristic affection of the Divine Mind, all the attributes of Deity are incessantly operating throughout the immensity of creation in the view of the inhabitants of all worlds. His *Omnipotence* is employed in supporting the worlds already created, and in bringing new systems, and new orders of beings into existence ; and his *Wisdom*, in devising, selecting, and arranging those means which are requisite for accomplishing the plans of benevolence. Towards those wretched beings who have abused his goodness, and wandered from happiness, his *Mercy* is proclaimed ; and his *Patience* and forbearance are long exercised, in order to lead them to repentance, and to the paths of felicity. His *Justice*, conjoined with his power, is exercised for the purpose of restraining the efforts of malevolence, for preventing the roads of anarchy and confusion, and for preserving the order and happiness of the intelligent creation. In this view, all the judgments, however dreadful and appalling, which have been inflicted on the workers of iniquity in every age, have had a tendency

to accomplish the purposes of benevolence, in reference to the universal system. For, the general good of God's universal empire, *considered as one whole*, must be viewed as the great end which benevolence is accomplishing, and the partial exclusions from happiness, which now happen in the case of certain classes of moral agents, must be regarded as necessary arrangements subservient to this important end. His infinite *Knowledge*, extending to all events, past, present, and to come ; and his *Omniscient* eye, piercing into the secret purposes of every heart, surveying the various tribes of men, and the circumstances of all the worlds which float in the immensity of space, and comprehending the remotest consequences of all actions throughout infinite duration, enable Him, in every instance, to form those arrangements by which the objects of benevolence may be accomplished on the most extensive scale, and by which the everlasting happiness of the holy and intelligent system may be most effectually secured.

For the purpose of displaying his love to the moral intelligences of our world, he has given us a revelation of his character and will ; he has exhibited his law as a law of love ; he has promised the agency of his holy Spirit, to produce in us those dispositions which his law requires ; and he has given the most affecting display of his love, in the mission of his Son into the world. "In this," says the Apostle John, "was manifested the love of God towards us ; because that God sent his only-begotten Son into the world, that we might live through him. Herein is love ; not that we loved God, but that he loved us, and sent his Son to be a propitiation for our sins. Beloved, if God so loved us, how ought we to love one another ?"

Now, we are commanded in the Sacred Scriptures to be imitators of God in his benevolent operations, and especially in those cases in which love requires to surmount every obstacle, and to exert all its powers in opposition to hatred, enmity, and ingratitude. "Be ye perfect," says our Saviour, "as your Father who is in heaven is perfect. Love your enemies ; bless them who curse you ; do good to them who hate you ; and pray for them who despitefully use you and persecute you. That you may be the children of your Father who is in heaven : for he maketh his sun to rise on the evil and on the good ; and sendeth rain on the just and on the unjust." So that his enemies subsist on his bounty, and are cheered and refreshed by his providential care. In like manner, the operation of love on the part of man may be considered as the whole energy of an intelligent mind, directing its faculties of perception, judgment, reasoning, and imagination, along with its physical powers, to the production of happiness both among friends and enemies, so far as its influence can extend. In the prosecution of this noble end, man

\* See pages 48—51

becomes "a worker together with God," a subordinate agent in carrying forward those plans of Infinite Benevolence which will issue in the ultimate happiness of the moral universe. And as the Almighty, in his benevolent operations, preserves the harmony of the universe by certain laws of order which he has established, as is apparent in the arrangement of the planetary system, and in the physical and moral economy of our terrestrial sphere; so it is the duty of man, in all the movements to which love impels him, to imitate his Creator in this respect, and to employ the intellectual faculties with which he is endued, for regulating the exercise of the benevolent principle, for adapting and proportioning means to ends, and for discriminating between rational and enthusiastic schemes of exertion; so that order may facilitate his movements, and that the greatest sum of happiness may result from his active endeavours.

We may now attend more particularly to the practical operations of love, and the objects towards which it should be directed.

The principal objects towards which our benevolence should be directed are, *intelligent beings*; and in the sphere of action to which we are at present confined, *man* is the chief object whom we have it in our power to benefit by our benevolent exertions. Our benevolent affections, indeed, ought to expand towards all the holy intelligences of which we have any intimation; and, in another stage of our existence, we may have an opportunity of mingling with other orders of intellectual beings, and of co-operating with them in diffusing happiness throughout the universe; but while we continue in this sublunary region, the improvement and happiness of our fellow-men is the chief object to which our exertions must necessarily be confined; and when we view the present state of the moral world in all nations and climates, we behold a field of exertion sufficiently ample to employ all the energies of benevolence that have ever yet been displayed, or perhaps ever will be displayed during the existing economy of our world.

Man may be considered in two points of view: as possessed of a *body*, which is susceptible of agreeable or disagreeable sensations and feelings; and, as endued with a *mind*, or spiritual principle which is capable of perpetual improvement in knowledge and virtue, and which is destined an endless existence. In both these respects, love will exert its powers in meliorating the condition and promoting the enjoyments of mankind. In regard to his *corporeal system*, man has various wants, which require to be supplied, and he is subjected to various sufferings which require to be soothed and alleviated. He stands in need of food, raiment, shelter from the blasts of the tempests, comfortable lodging and accommodation, light to cheer and enable him to prosecute his employments,

pure atmospheric air to invigorate his animal system, and water to cleanse and refresh him. He is exposed to corporeal weakness and mental imbecility; to pain, sickness, and disease; to the loss of sight, of hearing, and of bodily feelings; to the decrepitude of old age and to all those lingering disorders which terminate in dissolution. He is also exposed to the afflictions occasioned by the loss of friends and relatives; to dejection of mind, to remorse of conscience, to doubt, despondency, and despair, and to a long train of anxieties, vexations, perplexities, and troubles of various kinds. Now, in reference to the wants of mankind, love, when genuine and ardent, will endeavour to supply them wherever a deficiency is known to exist, and in reference to their calamities and sorrows, it will use its utmost exertions to relieve and assuage them, in as far its powers and influence can extend. In this respect, every one, however low his situation in life, however limited the range of his knowledge, and however contracted the sphere of his influence may be, has it in his power, in a greater or less degree, to communicate blessings to his brethren of mankind. He can visit the sick bed of an afflicted neighbour; he can supply a cup of cold water to cool his parched tongue; he can wipe the sweat from his forehead; he can smooth his pillow; he can turn him round on his bed of languishing, that he may enjoy a more comfortable repose; and he can cheer him with those expressions of tenderness and affection, which have a tendency above all other acts of kindness to soothe and revive the downcast spirit. He can assist his neighbour by his strength, or by his skill, by his counsel and advice, and by taking a lively interest in his concerns; he can promote his joy by rejoicing in his prosperity and success, by assisting him in his employment, by rescuing him from danger, by forgiving the injuries he may have received, by acknowledging the worth of the skill, virtues, and endowments of which he is possessed, and by listening with patience and complacency to his sentiments, complaints, or grievances. He can even promote the happiness of his neighbour in a negative way, by not injuring him in his character or reputation; by not standing in the way of his prosperity or advancement; by not thwarting him in his schemes and enterprises; by not interrupting him in his innocent amusements; and by refraining from every thing that would tend unnecessarily to injure him in his trade or profession. Such friendly attentions to promote the comfort of his fellow-men, every one has it in his power to bestow: and upon such apparently trivial actions the happiness of mankind in general more immediately depends, than on many of those legislative arrangements which arrest the attention of a whole empire. For were they universally performed, the greater part

of the miseries which afflict humanity would disappear from the world.

But, in cases where a high degree of intellectual talent, of wealth, and of influence is possessed, love is enabled to take a wider range in its beneficent operations, by endeavouring to counteract public evils, and to promote rational schemes of general philanthropy. When we take a survey of the condition of the great mass of the lower orders of society, we find them labouring under many physical evils and inconveniences, which have a tendency to injure their health and their comfort, and to obstruct their moral and intellectual improvement. In their private habitations, we find multitudes of them residing in places where they are almost deprived of light and of pure air, and surrounded with noxious effluvia, putrid smells, and every thing that is insalubrious and offensive to the senses. We find whole families packed into a narrow apartment of twelve feet square, in a narrow lane, where the rays of the sun never penetrate, where the refreshing breeze is seldom felt, and where the beauties of nature are never beheld. In public manufactories we find hundreds of men, women, and children, with pale faces and emaciated looks, breathing a polluted atmosphere half-poisoned with deleterious fumes, steam, smoke, or noxious gases. In large cities, we find numbers of children, through the carelessness and unprincipled disposition of their parents, left to wallow in filth and wretchedness, without even rags to cover their nakedness, and encouraged in the habits of pilfering, and of every other vice which can debase their minds and render them pests to society; and we behold others doomed to the degrading employment of chimney-sweeping, deprived of the attentions which flow from the tender affection of parents, and subjected to the harsh treatment of unfeeling masters. We behold multitudes of human beings torn from their families and their native land, cooped up in an infernal floating dungeon, carried to a foreign land, sold like cattle to an avaricious planter, and held in the chains of perpetual slavery. In reference to all these and similar evils which exist in human society, love will exert its energies, either to alleviate or to remove them. It will induce one individual to investigate their causes, to point out the proper means of remedy, and to publish to the world the result of his deliberations and researches. It will induce another to apply the discoveries of natural science and the inventions of art to the purpose of improving the physical condition of mankind. It will induce a third individual, in conjunction with others, to form rational plans of melioration, and to organize societies to carry them into effect; and it will impel others to come forward with their wealth and influence to provide the means for carrying forward on the most extensive scale the plans of general bene-

ficence. In short, the whole machinery of nature and art, of mind and matter, of religion and literature, of science and legislation, would be set in motion to promote the external enjoyments of mankind, were love a predominant principle in human society. Cottages on commodious and healthy plans would be reared for the industrious poor; streets would be formed and gardens allotted them for their pleasure and accommodation; public manufactories would be arranged and regulated in such a manner as to contribute to health, to comfort, and to rational improvement;\* the children of the poor would be fed and clothed, and trained up to habits of industry and virtue; employment would be provided for all classes of labourers and mechanics, and subsistence furnished when employment could not be procured; idleness would be universally discouraged, and honourable industry would be rewarded in such a manner as to afford not only the comforts, but even many of the luxuries of life; slavery in every shape, with all its injustice and cruelties, would be abolished, and rational liberty would be proclaimed among all ranks and in every clime.

Thus the man in whose heart love presides, takes a lively and sincere interest in every thing that has a tendency to promote the external comfort and welfare of his neighbour. He is compassionate and merciful, gentle and indulgent, kind and tender-hearted, generous and humane; he feels for the sorrows of suffering humanity, and his wealth and activity are directed to relieve the distresses of the poor and the afflicted, to feed the hungry, to clothe the naked, to protect the widow and the orphan, to encourage honest industry, to meliorate the condition of the useful mechanic, and to increase and extend his comforts and enjoyments. Of such a one it may be said, in the language of Job, "He is eyes to the blind, feet to the lame, and a father to the poor. When the ear hears him, then it blesses him, and when the eyes see him, it gives witness to him; because he delivers the poor that cries, and the fatherless, and him that hath none to help

\*Some may be disposed to insinuate, that such attempts would be altogether visionary, and could never be realized. But I would ask such persons. Have such schemes ever been attempted to be realized on an extensive scale? Has the promotion of the health and comfort of the industrious poor ever become a *particular object of attention* to the legislature to men of rank and influence, and to the whole class of opulent manufacturers? Is it not a fact, that while the acquisition of wealth is made the main object of attention, the melioration of the condition of the industrious labourer and mechanic is either altogether overlooked, or viewed as a very subordinate object of attention? He is generally left to shift for himself the best way he can, and left to breathe in an impure atmosphere without any *particular sacrifice* being made to remedy the evil. I venture to affirm, that were the comfort of the lower orders of society made as particular an object of attention as is the acquisition of wealth, every obstacle to its accomplishment would soon be removed.

becomes "a worker together with God," a subordinate agent in carrying forward those plans of Infinite Benevolence which will issue in the ultimate happiness of the moral universe. And as the Almighty, in his benevolent operations, preserves the harmony of the universe by certain laws of order which he has established, as is apparent in the arrangement of the planetary system, and in the physical and moral economy of our terrestrial sphere; so it is the duty of man, in all the movements to which love impels him, to imitate his Creator in this respect, and to employ the intellectual faculties with which he is endued, for regulating the exercise of the benevolent principle, for adapting and proportioning means to ends, and for discriminating between rational and enthusiastic schemes of exertion; so that order may facilitate his movements, and that the greatest sum of happiness may result from his active endeavours.

We may now attend more particularly to the practical operations of love, and the objects towards which it should be directed.

The principal objects towards which our benevolence should be directed are, *intelligent beings*; and in the sphere of action to which we are at present confined, *man* is the chief object whom we have it in our power to benefit by our benevolent exertions. Our benevolent affections, indeed, ought to expand towards all the holy intelligences of which we have any intimation; and, in another stage of our existence, we may have an opportunity of mingling with other orders of intellectual beings, and of co-operating with them in diffusing happiness throughout the universe; but while we continue in this sublunary region, the improvement and happiness of our fellow-men is the chief object to which our exertions must necessarily be confined; and when we view the present state of the moral world in all nations and climates, we behold a field of exertion sufficiently ample to employ all the energies of benevolence that have ever yet been displayed, or perhaps ever will be displayed during the existing economy of our world.

Man may be considered in two points of view: as possessed of a *body*, which is susceptible of agreeable or disagreeable sensations and feelings; and, as endued with a *mind*, or spiritual principle which is capable of perpetual improvement in knowledge and virtue, and which is destined an endless existence. In both these respects, love will exert its powers in meliorating the condition and promoting the enjoyments of mankind. In regard to his *corporeal system*, man has various *wants*, which require to be supplied, and he is subjected to various *sufferings* which require to be soothed and alleviated. He stands in need of food, raiment, shelter from the blasts of the tempests, comfortable lodging and accommodation, light to cheer and enable him to prosecute his employments,

pure atmospheric air to invigorate his animal system, and water to cleanse and refresh him. He is exposed to corporeal weakness and to mental imbecility; to pain, sickness, and disease; to the loss of sight, of hearing, and of bodily feelings; to the decrepitude of old age and to all those lingering disorders which terminate in dissolution. He is also exposed to the afflictions occasioned by the loss of friends and relatives; to dejection of mind, to remorse of conscience, to doubt, despondency, and despair, and to a long train of anxieties, vexations, perplexities, and troubles of various kinds. Now, in reference to the wants of mankind, love, when genuine and ardent, will endeavour to supply them wherever a deficiency is known to exist, and in reference to their calamities and sorrows, it will use its utmost exertions to relieve and assuage them, in as far its powers and influence can extend. In this respect, every one, however low his situation in life, however limited the range of his knowledge, and however contracted the sphere of his influence may be, has it in his power, in a greater or less degree, to communicate blessings to his brethren of mankind. He can visit the sick bed of an afflicted neighbour; he can supply a cup of cold water to cool his parched tongue; he can wipe the sweat from his forehead; he can smooth his pillow; he can turn him round on his bed of languishing, that he may enjoy a more comfortable repose; and he can cheer him with those expressions of tenderness and affection, which have a tendency above all other acts of kindness to sooth and revive the downcast spirit. He can assist his neighbour by his strength, or by his skill, by his counsel and advice, and by taking a lively interest in his concerns; he can promote his joy by rejoicing in his prosperity and success, by assisting him in his employment, by rescuing him from danger, by forgiving the injuries he may have received, by acknowledging the worth of the skill, virtues, and endowments of which he is possessed, and by listening with patience and complacency to his sentiments, complaints, or grievances. He can even promote the happiness of his neighbour in a *negative* way, by not injuring him in his character or reputation; by not standing in the way of his prosperity or advancement; by not thwarting him in his schemes and enterprises; by not interrupting him in his innocent amusements; and by refraining from every thing that would tend unnecessarily to injure him in his trade or profession. Such friendly attentions to promote the comfort of his fellow-men, every one has it in his power to bestow: and upon such apparently trivial actions the happiness of mankind in general more immediately depends, than on many of those legislative arrangements which arrest the attention of a whole empire. For were they universally performed, the greater part

of the miseries which afflict humanity would disappear from the world.

But, in cases where a high degree of intellectual talent, of wealth, and of influence is possessed, love is enabled to take a wider range in its beneficent operations, by endeavouring to counteract public evils, and to promote rational schemes of general philanthropy. When we take a survey of the condition of the great mass of the lower orders of society, we find them labouring under many physical evils and inconveniences, which have a tendency to injure their health and their comfort, and to obstruct their moral and intellectual improvement. In their private habitations, we find multitudes of them residing in places where they are almost deprived of light and of pure air, and surrounded with noxious effluvia, putrid smells, and every thing that is insalubrious and offensive to the senses. We find whole families packed into a narrow apartment of twelve feet square, in a narrow lane, where the rays of the sun never penetrate, where the refreshing breeze is seldom felt, and where the beauties of nature are never beheld. In public manufactories we find hundreds of men, women, and children, with pale faces and emaciated looks, breathing a polluted atmosphere half-poisoned with deleterious fumes, steam, smoke, or noxious gases. In large cities, we find numbers of children, through the carelessness and unprincipled disposition of their parents, left to wallow in filth and wretchedness, without even rags to cover their nakedness, and encouraged in the habits of pilfering, and of every other vice which can debase their minds and render them pests to society; and we behold others doomed to the degrading employment of chimney-sweeping, deprived of the attentions which flow from the tender affection of parents, and subjected to the harsh treatment of unfeeling masters. We behold multitudes of human beings torn from their families and their native land, cooped up in an infernal floating dungeon, carried to a foreign land, sold like cattle to an avaricious planter, and held in the chains of perpetual slavery. In reference to all these and similar evils which exist in human society, love will exert its energies, either to alleviate or to remove them. It will induce one individual to investigate their causes, to point out the proper means of remedy, and to publish to the world the result of his deliberations and researches. It will induce another to apply the discoveries of natural science and the inventions of art to the purpose of improving the physical condition of mankind. It will induce a third individual, in conjunction with others, to form rational plans of melioration, and to organize societies to carry them into effect; and it will impel others to come forward with their wealth and influence to provide the means for carrying forward on the most extensive scale the plans of general bene-

ficence. In short, the whole machinery of nature and art, of mind and matter, of religion and literature, of science and legislation, would be set in motion to promote the external enjoyments of mankind, were love a predominant principle in human society. Cottages on commodious and healthy plans would be reared for the industrious poor; streets would be formed and gardens allotted them for their pleasure and accommodation; public manufactories would be arranged and regulated in such a manner as to contribute to health, to comfort, and to rational improvement;\* the children of the poor would be fed and clothed, and trained up to habits of industry and virtue; employment would be provided for all classes of labourers and mechanics, and subsistence furnished when employment could not be procured; idleness would be universally discouraged, and honourable industry would be rewarded in such a manner as to afford not only the comforts, but even many of the luxuries of life; slavery in every shape, with all its injustice and cruelties, would be abolished, and rational liberty would be proclaimed among all ranks and in every clime.

Thus the man in whose heart love presides, takes a lively and sincere interest in every thing that has a tendency to promote the external comfort and welfare of his neighbour. He is compassionate and merciful, gentle and indulgent, kind and tender-hearted, generous and humane; he feels for the sorrows of suffering humanity, and his wealth and activity are directed to relieve the distresses of the poor and the afflicted, to feed the hungry, to clothe the naked, to protect the widow and the orphan, to encourage honest industry, to meliorate the condition of the useful mechanic, and to increase and extend his comforts and enjoyments. Of such a one it may be said, in the language of Job, "He is eyes to the blind, feet to the lame, and a father to the poor. When the ear hears him, then it blesses him, and when the eyes see him, it gives witness to him; because he delivers the poor that cries, and the fatherless, and him that hath none to help

\*Some may be disposed to insinuate, that such attempts would be altogether visionary, and could never be realized. But I would ask such persons. Have such schemes ever been attempted to be realized on an extensive scale? Has the promotion of the health and comfort of the industrious poor ever become a *particular object of attention* to the legislature to men of rank and influence, and to the whole class of opulent manufacturers? Is it not a fact, that while the acquisition of wealth is made the main object of attention, the melioration of the condition of the industrious labourer and mechanic is either altogether overlooked, or viewed as a very subordinate object of attention? He is generally left to shift for himself the best way he can, and left to breathe in an impure atmosphere without any *particular sacrifice* being made to remedy the evil. I venture to affirm that were the comfort of the lower orders of society made as particular an object of attention as is the acquisition of wealth, every obstacle to its accomplishment would soon be removed.

him. The blessing of him that was ready to perish comes upon him, and he causes the widow's heart to sing for joy."

But the activities of benevolence are not confined to the communication of sensitive enjoyments. Man is a rational and immortal, as well as a sensitive being; and the operations of genuine love will have for their ultimate object the promotion of his best interests as a moral and intellectual agent, and as an heir of immortality.

When we consider man as an intellectual being, standing in various important relations to his God and to his fellow-creatures, we behold numerous evils which require to be remedied, as well as in the circumstances of his physical condition. Though the human mind is capable of vast expansion, of acquiring an immense number of sublime and interesting ideas, and of enjoying the purest pleasure in contemplating the objects which lie within its range, yet it is a melancholy fact, that in all ages, mental darkness has enveloped the great majority of our race; and that the grossest ignorance of the most important truths, accompanied with the most degrading affections, still prevails among the greater part of the population of every region of the globe. We need not go to the frozen climes of Lapland and Labrador, to the filthy huts of the Greenlander and the Esquimaux, to the rude savages of Nootka Sound, to the degraded tribes of New-Holland and Van Dieman's Land, to the wild and wretched Boshemen and Caffres, or to the swarthy sons of Central Africa, in order to be convinced of this lamentable truth. We need only to look around us among the various ranks of our own population, and we shall not fail to see ignorance, in all its diversified forms, exerting its malign influence over the minds of men, accompanied with superstition, enthusiasm, bigotry, intolerance, and every grovelling affection that can debase the human mind. Multitudes of the young, both in the city and in the country, are suffered to shoot up from infancy to manhood, as if they were mere animal existences, ignorant of the character and operations of God, of the duties they owe to their Creator and to one another, and of the eternal state of existence to which they are destined. Even in many of those places where instruction is attempted to be communicated, what a pitiful picture is exhibited of the results of education, and of the folly which attaches itself to the character of man! The pronunciation of a number of unmeaning words, the reciting of passages which the young cannot understand, the repetition of a few propositions in religion to which no ideas are attached, and the casting of a few accounts, are considered as sufficient to lead them forward in the path of knowledge and virtue; and are substituted in the place of those definite and luminous instructions which are requisite to expand the opening intellect, to convey distinct ideas to the mind, to unfold the

scenes of creation and providence, to display the character of God, and to train up the youthful mind to glory and immortality.

Now, in reference to the ignorance which prevails in the world, love to man, as an intellectual being, will excite to active endeavours in order to counteract its influence. It will prove an excitement to the erection of seminaries of instruction wherever they are deficient; it will patronize every scheme and every exertion by which knowledge may be increased; and will diffuse mental illumination as far as the sphere of its influence extends. It will not rest satisfied with the form of instruction, without the substance; with the elements of language, without the elements of thought; with the key of knowledge, without knowledge itself; but will devise rational plans for conveying *substantial* information to the minds of the young, so as to win their affections, arrest their attention, and carry them forward with pleasure in the paths of improvement. It will not offer them stones and ashes instead of bread, but will spread before them an intellectual feast, and "feed them with knowledge and understanding." It will not confine its attention merely to the instruction of the young, but will endeavour, by writing, by conversation, by lectures, by lending and circulating books, by establishing public libraries, and by organizing rational and scientific institutions, to diffuse the rays of intellectual light among men of all ages, ranks, and professions; and will never cease its exertions till ignorance, with all its degrading accompaniments, be banished from society, and till the light of truth illuminate the inhabitants of every land. In a word, it will endeavour to render every branch of knowledge subservient to the illustration of the character and the revelation of God, and to the preparing of mankind for the employments of that nobler state of existence to which they are destined.

Again, as man is possessed of an immortal nature, and in his present state of sin and degradation is exposed to misery in the future world, so it is one of the highest offices of love to endeavour to promote the eternal salvation of mankind. For the accomplishment of this important object, all its activities are concentrated, and all its other labours are rendered subservient. To improve the physical condition of man as a sensitive being, and to enlarge his knowledge as an intellectual, while we overlook his eternal interests, is to neglect one of the most important duties of Christian philanthropy. The sensitive enjoyments of man are conducive to his happiness so long as they continue; and "knowledge is pleasant to the soul." But what are all the acquisitions and enjoyments of time, when compared with the concerns of eternity! and what will they avail, if their possessor be found *unqualified* for the employments of an endless life! If the soul of man be an immortal principle, and if the least

danger exists of its being deprived, though ignorance and guilt, of happiness in the future world, no words can express the importance which ought to be attached to this "labour of love." "What will it profit a man if he shall gain the whole world, and lose his own soul? or what shall a man give in exchange for his soul?" And therefore, the man in whose breast true benevolence resides, will consider the eternal happiness of his fellow-immortals as the grand and ultimate object which ought always to be kept in view, and will exert all his faculties, powers, and influence, in order to its accomplishment. He will not rest satisfied with prayers and wishes for the salvation of men; he will not wait for any extraordinary afflatus of the Divine Spirit; but will prosecute with judgment and perseverance that course of active duty, which has a tendency to produce the desired effect. So far as the circle of his influence extends, he will endeavour to instruct the ignorant, to arouse the careless, to reclaim the dissipated, to convince the skeptic, to train up the young in the knowledge of God and in the paths of virtue, and to encourage and animate every one who is inquiring the way to eternal life. He will exhibit religion in its most amiable, and attractive, and sublime aspects; and will endeavour to fix the attention on the lovely tempers, and the beneficial effects which the observance of its precepts has a tendency to produce. He will not make it his chief object to convert men to the belief of certain metaphysical dogmas in religion, nor to gain them over to embrace the peculiarities of a party; but to produce in their minds a cordial acquiescence in the plan of salvation which the Gospel exhibits, a reverence of the divine character and perfections, a desire to cultivate holy tempers, and a fixed determination to walk in the paths of God's commandments.

Such a character will give every due encouragement by his advice and by his wealth to Christian churches, and to faithful and intelligent ministers of religion. He will patronize every rational scheme which has for its object to propagate the Gospel of peace among all nations. He will encourage the translation of the Scriptures into the languages of all kindreds and tribes; he will give countenance to societies formed for circulating the Bible in foreign lands; and he will assist in sending forth intelligent and philanthropic missionaries to barbarous and unenlightened tribes, for the purpose of diffusing the blessings of knowledge, civilization, and religion; and he will rejoice to co-operate in such benevolent schemes with all who sincerely wish to promote the best interests of their fellow men, by whatever name they are distinguished, and to whatever section of the Christian church they may belong.

In short, love, when genuine and ardent, will set itself in opposition to every species of bigotry and intolerance, and to all those petty jealousies

and bitter animosities which have so long distracted the Christian church, which have thrown an odium on its character, and prevented the harmonious intercourse of the followers of Jesus. It will make every sacrifice consistent with the great objects of Christianity, and will use every appropriate mean to heal the unhappy divisions which exist in the religious world, and to promote an affectionate union of "all who love our Lord Jesus in sincerity;" in order that the church of Christ may form one compact harmonious body, in opposition to atheists, skeptics, and the men of the world, and in order that every plan and effort to diffuse the knowledge and influence of the Christian religion may be carried more speedily and more extensively into effect.

With regard to all the other branches of Christian morality, and to all the virtues which can adorn the human character, in every station and relation in life, they will be found to flow from the exercise of the principle I have now been illustrating, as naturally as the sap flows from the trunk of the remotest ramifications of a tree, or as the gas which now illuminates our streets and churches flows from the main gasometer, through hundreds of pipes, to all the different burners. Sincerity and veracity in our words and actions, honesty and fair dealing in trade and commerce, fidelity to compacts and engagements, a regard to public liberty, an equitable administration of justice, condescension and kindness to inferiors, reverence and respect to superiors, submission to just laws and regulations, friendship, and a cordial interchange of friendly sentiments and affections; courtesy, civility, affability, harmony, and good neighbourhood; modesty, chastity, and discretion; forgiveness of injuries, hospitality to strangers, humanity to servants and dependants, compassion to the distressed; parental, filial, and fraternal affection, sympathy, generosity, temperance, and fortitude, together with all the other social virtues which unite man to man, will as naturally flow from the fountain of love, when it exists in the human breast, as water flows from a reservoir, through all the pipes which distribute it to the inhabitants of a large city. For he who withholds the exercise of such virtues, or acts in direct opposition to them, can never be supposed to be sincerely attached to his fellow-creatures, or to consult their happiness; and the meaning of language must be inverted before we can apply to him the epithet *benevolent*; and the order of the moral system deranged, before we can expect happiness to flow from such a conduct.

The cardinal virtues have been arranged by some moralists under the heads of *Prudence*, *Temperance*, *Fortitude*, and *Justice*. *Prudence* consists in judging what is best, in the choice

both of ends and means, particularly in reference to our own interests, and to the good or evil which may result from our choice. *Temperance* is that virtue which moderates and restrains the sensual appetites. *Fortitude* is that calm and steady habit of the mind which either enables us bravely to encounter the prospect of ill, or renders us serene and invincible under its immediate pressure. *Justice* is that virtue which impels us to give to every person what is his due. Now, it could easily be shown, that love is the impelling principle which excites to the exercise of all these virtues. It will lead us to pay a due regard to our own comfort and interest, but not so as to interfere with the interests or to obstruct the happiness of others. It will teach us to preserve the dominion of the soul over sense and passion, and to restrain the influence of the sensual appetites, from considerations drawn from our own happiness, and from the good of others. For, as intemperance kindles the fire of resentment and the flames of lust, excites to boisterous words and to lawless actions, wastes the substance and reduces families to wretchedness and ruin, it must be directly opposed to the principle of benevolence. It will inspire us with a generous and heroic indifference to the precarious possessions of this mortal scene, and will excite to activity and perseverance in promoting human happiness, in the face of every difficulty and obstruction, and in spite of obstinacy and ingratitude, and of all the sneers and reproaches that may be thrown out upon us on account of the singularity of our conduct. And as *Justice* is nothing else than the *measure of benevolence*, it will uniformly direct us to give to every one his due, and restrain us from withholding from our neighbour any thing to which he is entitled by equity or by law. And in cases where the division of property is concerned, it will in many instances be induced to relinquish its right when only a few paltry pounds or shillings are at stake, rather than run the risk of dissolving the bonds of affection and friendship.

The duties of morality have by other moralists, particularly by the moderns, been arranged into *the duties we owe to God*, as piety, reverence, and confidence; *the duties we owe to other men*, as fidelity, loyalty, humanity, and justice; and *the duties we owe to ourselves*, as chastity, sobriety, and temperance. From what has been already stated, both in this and in several of the preceding sections, it will obviously appear, that all these classes of duties necessarily flow from the operation of that primary, diffusive, and ever active principle, which resides originally in the Eternal Mind, and which pervades the minds of all holy intelligences.

Finally, The man who is animated by the noble principle of benevolence, will endeavour to discharge with fidelity every social and relative duty, and will feel an interest in the domestic

comfort and the moral and religious improvement of all around him. He will display the activities of this holy affection more immediately in the family in which he resides, as a friend, a father, a husband, a son, or a brother; performing with punctuality all the duties which such relations include; promoting unity, harmony, affection, and a reciprocal interchange of all those offices of kindness, which tend to secure mutual confidence, pleasure, and improvement. From the family, his affections will be diffused to the neighbourhood around, in all the forms of kindness, compassion, faithfulness, forgiveness, charity, generosity, humanity, and justice. He will contemplate every member of society as a kinsman and a brother; he will feel a fraternal attachment; he will delight in his success and prosperity, and will endeavour to encourage the social virtues, and to multiply the sources of enjoyment wherever his influence extends. From the circle of his immediate neighbourhood, his affections will extend over all the nation to which he belongs. Its prosperity and advancement in arts, sciences, and legislation, its peace and tranquillity, and the wisdom and rectitude of its rulers, will be the object of his fervent prayers to the God of heaven. To watch over its interests, to promote the improvement of its constitution and its laws, to expose the intrigues of bribery and corruption, to resist the efforts of tyranny and ambition, and to defeat every encroachment on its rights and liberties, in a manly and Christian manner, he will consider as a duty which he owes to his fellow-subjects, to his rulers, and to succeeding generations. It will be his chief aim, not so much to prevent men from becoming thieves, and robbers, and murderers, as to make them pious, virtuous, and useful members of the general community; that every one may live "a quiet and peaceable life, in all godliness and honesty."

Nor will his benevolence be confined within the limits of a narrow-minded and selfish patriotism:—his affections will expand to surrounding nations, and embrace the interests of every people, and will excite him to co-operate in every scheme by which civilization and science, liberty and Christianity, may be promoted among all the tribes and kindreds of the earth. He will occasionally transport himself in imagination to distant climes, and to the islands scattered over the face of the ocean,—and the joy or sorrow which is felt in the hut of the Greenlander, in the Indian wigwam, or among the tents of the Tartars, will find access to his feeling heart. An inundation, an earthquake, the eruption of a volcano, a destroying pestilence, or the horrors of war, happening in Persia, China, or Japan, will not be viewed with apathy or indifference, because those countries are placed thousands of miles beyond the boundaries of his own; but he will sympathise in the sorrows of those distant

sufferers, as well as in the calamities which befall his brethren in his native land. Nor will his affections be confined to the men of the present age, but will stretch forward to embrace the sons and daughters of future times, who are destined to appear on the theatre of this world, in successive generations, till time shall be no longer. The plans which he now forms, the ground-works of the improvements which he is now establishing, and the diversified operations of benevolence in which he is now engaged, will have, for their ultimate object, the diffusion of the light of science and of religion, and the communication of happiness, in various forms, to unnumbered multitudes of the human race, after his spirit shall have taken its flight beyond the bounds of this terrestrial sphere. Nor will the current of his love towards fellow-intelligences be bounded by the limits of time, and the range of this sublunary system, but will run forward into those interminable ages, which shall succeed the dissolution of our globe, and will rise upward to the inhabitants of those glorious worlds which roll in the distant regions of creation. Contemplating the diversified scenes in which he may hereafter be placed, and the various orders of intellectual beings with which he may mingle, his soul will be transported at the prospect of entering upon a more extensive field for the range of his benevolent affections, and of being qualified to receive and to communicate happiness on a more enlarged scale, in company with other holy intelligences,—where the field of benevolence will be continually expanding, and the most exquisite delight springing up in his bosom, and ever increasing, as eternal ages are rolling on.

Thus, it appears, that Benevolence is an expansive and an ever active principle, diffusing happiness in its train wherever it extends. Were an extensive moral machinery to be set in action by this powerful principle, it is impossible to describe what a variety of blessings would soon be distributed among mankind, and what a mighty change would be effected in the social state of human beings, and on the whole aspect of the moral world. And from what has been already stated, it is evident, that, although intellectual talent, wealth, and influence, have most in their power, as the prime directors of the moral machine,—yet there is no individual in whom this principle resides, however limited his faculties, and his sphere of action, but has it in his power to communicate happiness to his fellow creatures, and to become at least a subordinate agent in promoting the plans of universal benevolence.

From what has been stated above, and in several of the preceding parts of this work, we may learn, that, in order to acquire a knowledge of our duty, and of the motives which should stimulate us to its performance, there is no need to engage in the study of voluminous systems of

ethical science, or to perplex the mind with laboured disquisitions on the principles of morals. The general path of duty is plain to every one who is inclined to walk in it; and whoever wishes to be assisted and directed in his progress towards moral perfection, will find, in the Proverbs of Solomon, the sermons of Jesus Christ, and the practical parts of the apostolic epistles, maxims, and precepts, and motives inculcated, infinitely superior in regard both to their authority and their excellence, to those of all other systems of moral philosophy, whether in ancient or in modern times. This seems to be partly admitted even by moral philosophers themselves. The celebrated Dr. Reid, in his "Essays on the Active Powers of Man," after a variety of learned and abstract discussions on active power, and the principles of human action, when treating on the theory of morals, says, "This is an intricate subject, and there have been various theories and much controversy about it in ancient and in modern times. But it has little connexion with the knowledge of our duty, and those who differ most in the theory of our moral powers, agree in the practical rules of morals which they dictate. As a man may be a good judge of colours, and of the other visible qualities of objects, without any knowledge of the anatomy of the eye, and of the theory of vision; so a man may have a very clear and comprehensive knowledge of what is right and of what is wrong in human conduct, who never studied the structure of our moral powers. A good ear in music may be much improved by attention and practice in that art; but very little by studying the anatomy of the ear, and the theory of sound. In order to acquire a good eye, or a good ear, in the arts that require them, the theory of vision, and the theory of sound, are by no means necessary, and indeed of very little use. *Of as little necessity or use is what we call the theory of morals, in order to improve our moral judgment.*"—REID, "On the Active Powers," Essay v. chap. 2.

To a man who is familiar with the Scriptures, and whose mind has acquired a relish for the simplicity and excellence of the Christian code of morals, how cold, and frigid, and uninteresting, do the laboured disquisitions of our most celebrated ethical writers appear! There is little to be found in such writings to kindle the fire of holy love, and to inspire the soul with a noble ardour, in carrying forward the plan of divine benevolence. What powerful stimulus to exalted virtue can be expected from abstract discussions on active power, on liberty and necessity, on theories of moral action, on the reason and fitness of things, on self-love, on public and private interest, on the law of honour, and the like; and of how little practical utility are the results of such disquisitions; since every principle of action, every motive, and every duty conducive to

the happiness of the intelligent system, is laid down in the Scriptures, with a plainness and perspicuity, which render them level to the meanest understanding? And what shall we say of those moralists who teach us, that "modesty, humility, and forgiveness of injuries," belong to the class of vices;\* and, by consequence, that pride, imprudence, and revenge, are to be ranked among the virtues! Such virtue, alas! has too long prevailed in our degenerate world; but were it universally to prevail, it would transform creation into a chaos, and banish happiness from the universe. What beneficial practical effects have ever yet been produced by all the systems of ethics which have hitherto been published to the world? Let us look back on the nations of antiquity, on the schools of Plato, Socrates, Epicurus, and Zeno; let us survey the conduct of our modern skeptical philosophers, and the practices of our youths who attend courses of ethical lectures in our universities and academies, and say, whether the general depravity of human nature has been counteracted, and a spirit of universal benevolence has been cherished and promoted by such instructions. I venture to affirm, that we are far more indebted to our Saviour's sermon on the mount, and to the practical writings of the apostle Paul, for that portion of morality which has given a polish to the manners of modern society, than to all the systems of ethics, detached from Christianity, which have ever been published by the philosophers either of Greece or Rome, or of the British empire: and, that it is only by following out the instructions of these divine teachers that we can expect to see the world regenerated, and vice and iniquity banished from our streets.

In throwing out the preceding hints, I have confined my attention chiefly to the intelligent creation. But it is evident, that where a principle of genuine love actuates the mind, it will extend its benevolent regards even to the lower orders of animated existence. Towards them the Creator has displayed his benevolence, as well as towards man. He has framed their bodies in as curious and admirable a manner, as the bodies of mankind. He has bestowed upon them organs of sensation exactly adapted to the situations they occupy, and to their various modes of subsistence. He has formed them with instincts which enable them to construct their habitations, to select their food, to protect themselves from danger, and to choose the fittest places for bringing forth their young. He has provided, in the different departments of nature, all that variety of food which is requisite to supply the wants of the whole of that immense assemblage of living beings which traverse the air, the waters, and the earth. "These all wait upon Him, and he giveth them their meat in due season."

\* This sentiment is taught by Mr. Hume, and his followers.

Their sportive motions, their varied movements, and the delight with which they seem to exercise their faculties, testify, that they are the objects of the beneficence of their Almighty though unknown Maker. So that God not only takes care of men, but of the fishes of the sea, the creeping insects, and the fowls of heaven, for "a sparrow cannot fall to the ground" without his providential permission.

This benevolent care of the Creator, which extends to the lowest order of his creatures, instructs us, that our benevolence also should be displayed towards the inferior ranks of sensitive existence—that we should not only abstain from vexing, and torturing, and unnecessarily depriving them of existence; but should endeavour to promote their comfort and enjoyment. It was the object of several of the laws delivered to the Jews, to inculcate compassion and humanity towards their domestic animals: and Solomon lays it down as a moral maxim, that "the righteous man regardeth the life of his beast." Benevolence will display itself, in the shape of tenderness and humanity towards every creature that is endowed with feeling and sensation; but it cannot be supposed to have a powerful influence over that man who can wantonly torture a poor fly, lash a feeble old horse, wound a bird or a hare for mere sport, twirl a cockchafer on a crooked pin, or even intentionally trample under foot a snail or a worm, that is doing him no injury. The benevolent man rejoices in the happiness of all creation around him; and, were this disposition universally prevalent, not only should we see cock-fighting, dog-fighting, bull-baiting, and other cruel and degrading sports for ever abolished, but should form a more delightful intercourse with many of the lower animals than we have ever yet enjoyed.—The Arabians never beat their horses; they never cut their tails; they treat them gently; they speak to them, and seem to hold a discourse; they use them as friends; they never attempt to increase their speed by the whip, nor spur them but in cases of great necessity. They never fix them to a stake in the fields, but suffer them to pasture at large around their habitations; and they come running the moment they hear the sound of their master's voice. In consequence of such treatment, these animals become docile and tractable in the highest degree. They resort at night to their tents, and lie down in the midst of the children, without ever hurting them in the slightest degree. The little boys and girls are often seen upon the body or the neck of the mare, while the beasts continue inoffensive and harmless, permitting them to play with and caress them without injury.—Several species of birds have a natural attachment to the habitations of man; but his malevolence prevents them from entering into any intimate and friendly association; for they seem to be fully aware of

his guns, and snares, and other arts of destruction, which make them shy, even in cases of necessity, of trusting themselves to his generosity and protection. How many amusing and instructive associations might be formed with this class of animals, if the kindness and benevolence of man were to secure their confidence! Even the beasts of the forest, the elephant, the lion, and the tiger,\* have had their ferocious dispositions softened by kindness and attention, and have become the protectors and the friends of man.

Although the lower animals seem to be incapable of making improvements when left to themselves, yet experience has proved, that, under the tuition of man, they are capable of making considerable advancement in knowledge, and in the exercise of the benevolent affections. Kindness and affection will frequently soften the most savage and obdurate dispositions among mankind; and it is not improbable, that a judicious and universal display of friendly attentions towards those animals which occasionally associate with man, would go far to counteract their malevolent propensities, and to promote their harmony and affection. I never was more delighted with an exhibition of animals than on a late occasion, when I beheld a cat, a bird, and a mouse living in the same cage, in the most cordial harmony and peace—a fact which demonstrates that the strongest antipathies of the animal tribes may be overcome by the care and attention of man. And as such an experiment could not have been attempted with success, except when these animals were very young, it shows us the immense importance of an early attention to the training of our youth in habits of kindness and affection towards each other, and of humanity towards every sensitive being; and that it ought to be the great care of parents, nurses, and servants, to counteract the *first appearance* of malevolent dispositions in very early life, however trivial the circumstances in which such dispositions are manifested.

The famous Baron Trenck, when confined in his dungeon in Magdeburg, had so tamed a mouse, that it would play round him, and, eat round him, and eat from his mouth. When he whistled, it would come and jump upon his shoulder. After his cruel keepers had given orders that he should be deprived of its society, and had actually taken it away blindfolded, it found its way back again to the door of his dungeon, waited the hour of visitation, when the door would be opened, and immediately testified its joy, by its antic leaping between his legs. This mouse was afterwards carried off, and put into a

cage, where it pined, refused all sustenance, and, in a few days, was found dead. "In this small animal," says the Baron, "I discovered proofs of intelligence too great to easily gain belief. Were I to write them, such philosophers as suppose man alone endowed with the power of thought, allowing nothing but what they call instinct in animals, would proclaim me a fabulous writer, and my opinions heterodox to what they suppose sound philosophy."—A nobleman of France, a Count Lauzun, was condemned to a rigid imprisonment. Cut off from all human society, and allowed no means of diverting his solitude, he made a companion of a spider, who had spun her web in the corner of his cell. He at length familiarized her so far, that she would come upon his hand, and eat from it a portion of his food which he gave her. The jailer, totally devoid of feeling, thought this too great an indulgence for the unfortunate prisoner, and crushed the spider to death.

Many such instances could be brought forward to illustrate the affection of the inferior tribes, and their capability of improvement. But although they were entirely destitute of mental qualities and affections, as they are sensitive beings, susceptible of pleasure and pain, the truly benevolent man will never intentionally inflict upon them unnecessary pain, and far less will he ever enjoy a savage delight, like some monsters in human shape, in beholding them writhing under the agonies occasioned by barbarous treatment. He will feel a joy in their comfort, and will endeavour to counteract their malignant propensities, and to train them up in those habits by which they may be rendered useful to man, and pleasing to each other. Were such a kind and humane disposition towards the lower animals generally to prevail, we might ultimately expect the literal accomplishment of those predictions recorded in ancient prophecy:—"In that day will I make a covenant for them with the beasts of the field, and with the fowls of heaven, and with the creeping things of the ground; and I will break the bow and the sword, and the battle out of the earth, and will make them to lie down safely." "I will cause the evil beasts to cease out of the land, and they shall dwell safely in the wilderness, and sleep in the woods." "The wolf shall dwell with the lamb: the cow and the bear shall feed in one pasture, and their young ones shall lie down together; the sucking child shall play on the hole of the asp, and the weaned child shall put his hand on the adder's den. They shall not hurt nor destroy in all my holy mountain, saith the Lord."

The remarks which have been stated in this section, in reference to the practical influence of the principle of benevolence, are intended merely as a few insulated hints in regard to some of the modes in which it may be made to ope-

\* An experiment was lately exhibited, by the keeper of the animals in the Tower of London, which demonstrates, that even the tiger is capable of being tamed, and rendered susceptible of friendly feelings towards man.

case. To illustrate its operation in detail, and to trace its progress in all its diversified bearings and ramifications, would be, to write a Body of Practical Morality, which would fill several volumes—a work which is still a desideratum in Christian literature. I cannot conclude this chapter more appropriately than with the following excellent passage, extracted from Dr. Dwight's "System of Theology."

"The divine law is wholly included in two precepts: *Thou shalt love the Lord thy God with all thy heart; and thy neighbour as thyself.* These are so short, as to be necessarily included in a very short sentence; so intelligible, as to be understood by every moral being who is capable of comprehending the meaning of the words God and neighbour; so easily remembered as to render it impossible for them to escape from our memory, unless by wanton, criminal negligence of ours; and so easily applicable to every case of moral action, as not to be mistaken unless through indisposition to obey. At the same time, obedience to them is rendered perfectly obvious and perfectly easy to every mind which is not indisposed to obey them. The very disposition itself, if sincere and entire, is either entire obedience,

or the unfailing means of that external conduct by which the obedience is in some cases completed. *The disposition to obey is also confined to a single affection of the heart, easily distinguished from all other affections, viz. love. Love, saith St. Paul, is the fulfilling of the law.* The humblest and most ignorant moral creatures, therefore, are in this manner efficaciously preserved from mistaking their duty.

"In the mean time, *these two precepts*, notwithstanding their brevity, are so comprehensive as to include every possible action. The archangel is not raised above their control, nor can any action of his exceed that bound which they prescribe. The child who has passed the verge of moral agency, is not placed beneath their regulation; and whatever virtue he may exercise, is no other than a fulfilling of their requisitions. All the duties which we immediately owe to God, to our fellow-creatures, and to ourselves, are, by these precepts, alike comprehended and required. In a word, endlessly varied as moral action may be, it exists in no form or instance in which he who perfectly obeys these precepts will not have done his duty, and will not find himself justified and accepted by God."

## CHAPTER III.

### ON THE MORAL LAW AND THE RATIONAL GROUNDS ON WHICH ITS PRECEPTS ARE FORMED.

In the preceding chapters, I have endeavoured to illustrate the foundation of love to God, from a consideration of his attributes, and the relations in which he stands to his creatures. I have also illustrated the rational grounds of love to our neighbour, from a consideration of the natural equality of mankind, of the various relations in which they stand to one another, and of their eternal destination. The dismal consequences which would result from a total subversion of these laws, the beneficial effects which would flow from their universal operation, their application to the inhabitants of other worlds, the declarations of Scripture on this subject, and the various modes in which benevolence should display its activities, have also been the subject of consideration.

The two principles now illustrated, may be considered as two branches proceeding from the same trunk, and spreading into different ramifications. The first four commandments of the moral law may be viewed as flowing from the principle of love to God, and the remaining six as ramifications of the principle of benevolence, or love to man. In the following brief

illustrations, I shall endeavour to show the reasonableness of these moral laws in relation to man, from a consideration of the misery which would necessarily result from their universal violation, and of the happiness which would flow from universal obedience to their requisitions.

These laws were published in the most solemn manner, to the assembled tribes of Israel in the wilderness of Horeb. While Mount Sinai was shaking to its centre, and smoking like a furnace; while flames of fire were ascending from its summit, and thick darkness surrounding its base; while thunders were rolling in clouds above, and lightnings flashing amidst the surrounding gloom; and while the earth was quaking all around, and the voice of a trumpet waxing louder and louder,—in the midst of this solemn and terrific scene, God spake the commandments with an audible articulate voice, in the hearing of the trembling multitude assembled round the mountain. A combination of objects and events more awful and impressive, the human mind can scarcely conceive; compared with which, the pretended pomp of Pagan deities,

and Jupiter shaking Olympus with his imperial rod, are lame, ridiculous, and profane; and never, perhaps, since the commencement of time, was such a striking scene presented to the view of any of the inhabitants of this world. The most solemn preparations, were made for this divine manifestation; the people of Israel were commanded to purify themselves from every mental and corporeal pollution, and strictly enjoined to keep within the boundaries marked out for them, and not to rush within the limits assigned to these awful symbols of the Deity. An assemblage of celestial beings, from another region of creation, was present on this occasion, to perform important services, to swell the grandeur of the scene, and to be witness of the impressive transactions of that solemn day.\* Moses was appointed as a temporary mediator between God and the people, to explain to them in milder terms the words of the law, and the further intimations of the divine will. Yet so terrible were the symbols of the present Deity, that even Moses was appalled, and said, "I exceedingly fear and quake." In order that the impressive words which were uttered on that day might not be forgotten in future generations, they were written on tables of stone with the finger of God. They were not simply *drawn* on a plane, like the strokes of writing upon paper, but the characters were *engraved*, or cut out of the solid stone, so that they could not be erased. They were not written on paper or parchment, or even on wood, but on *stone*, which is a much more durable material. "The tables were written upon *both their sides*, on the one side, and on the other were they written; and the tables were the work of God, and the writing was the writing of God, graven upon the tables."† This was intended to prevent the possibility of any thing being added to the law, or taken from it. The tables were two in number, the one containing the precepts which inculcate love to God, and the other containing those which enjoin the love of our neighbour. These laws, thus engraved on the most durable materials, were deposited in the most sacred part of the tabernacle, in the ark of the covenant under the mercy-seat. All the striking circumstances, now mentioned, were evidently intended to proclaim the Majesty and Grandeur of the Supreme Legislator—the excellency and perfection of his law—that it is the eternal and unalterable rule of rectitude—

\* Stephen says, that the Jews "received the law by the disposition of angels." Grotius observes, on this passage, that the Greek proposition (*eis*) here signifies *amidst*, and that (*diatagae angelon*) denotes *troops* of angels ranged in military order; and that there is a reference to Deut. xxxiii. 2. "The Lord came from Sinai, and rose up from Seir unto them; he shined forth from Mount Paran, and he came with ten thousands of his holy ones; from his right hand went a fiery law for them."

† Exod. xxxii. 45.

that it is of perpetual obligation on all the inhabitants of the earth—that it is the rule of action to angels and archangels, and to all other moral intelligences, as well as to the human race—and that the most dreadful consequences must ensue on all those who persist in violating its righteous precepts.

The proclamation of this law was prefaced by these words, "I am Jehovah thy God," which contain a ground and reason for our obedience. They evidently imply, that he is the Self-existent and Eternal Being who brought the vast universe into existence, who "garnished the heavens, and laid the foundations of the earth," and peopled all worlds with their inhabitants—that he has sovereign authority to prescribe a rule of action to his creatures—that he knows best what laws are requisite to preserve the order of his vast empire, and to secure the happiness of the intelligent creation—that he is the former of our bodies, the Father of our spirits, and the director of all the movements of nature and providence, from whose unceasing agency every joy proceeds—and that all his regulations and arrangements are calculated to promote the present and everlasting felicity of all rational agents that submit to his authority.—That these laws are not mere acts of Divine Sovereignty, but founded on the nature of things, and are calculated to preserve the harmony and order of the intelligent universe, will appear from the following illustrations and remarks.

#### THE FIRST COMMANDMENT.

*Thou shalt have no other gods before me.*

All the commandments, except the fourth and fifth, are expressed in a negative form: But it is obvious, that every negative command includes a requisition of the duty which is opposed to the sin forbidden; and those which are positive include a prohibition of the conduct which is opposed to the duty required. This first commandment, therefore, though expressed in the negative form, must be considered as including a positive injunction to love God with all our hearts, to offer a tribute of supreme adoration to his perfections, and to exercise the graces of hope, gratitude, submission, and reverence. Having already considered the precept in this point of view, (pp. 85—95) it is only necessary, in this place, to attend for a little, to the negative form of the command. The prohibition contained in this precept must be considered as extending not only to Polytheism, and the various objects of worship which have prevailed in the heathen world, but to every thing which is the object of our supreme affection and regard.

It is a dictate of enlightened and unprejudiced reason, that the Being to whom we are indebted for our existence, on whom we every moment

depend, who directs the movements of the system of nature, who daily loads us with his benefits, and on whom our hopes of eternal felicity entirely depend—should be contemplated with the most ardent affection and gratitude, regarded as the most excellent and venerable of all beings, and recognized as the Supreme Legislator, whose laws we are bound, by every tie of gratitude, to obey. Wherever such sentiments and affections pervade the mind, they constitute the first principles of piety, the source of all holy obedience, and the foundation of all true happiness. Were they universally felt, and acted upon by human beings, the Most High God, would be adored in every land, his image would be impressed on every heart, his righteous law would never be violated, grovelling desires and affections would be eradicated, and our world would be transformed into an abode of felicity, where joys similar to those of angels would succeed to scenes of wretchedness and wo.

On the other hand, where the unity and the attributes of the divine Being are not recognised, and where other objects are substituted in his place, the foundations of religion, and of moral order are completely subverted, and a door opened for the introduction of every absurdity, immorality, and vile abomination, that can degrade a rational intelligence. The command under consideration is placed on the front of the divine law as the foundation of all the other precepts; and, therefore, wherever it is violated, or not recognised, a regular obedience to the other subordinate injunctions of religion is not, in the nature of things, to be expected. Were its violation, in our world, complete and universal, it is impossible to say what would be the miserable condition of human beings in their social capacity. To its general violation, may be traced all the evils under which humanity has groaned in every age, and all the depraved passions, and shocking immoralities which now disfigure the aspect of the moral world.

There is nothing that appears more prominent in the history and the character of almost every nation under heaven, than an infringement of this first and fundamental law of the Creator. A rational and enlightened mind, on the first consideration of this subject, would be apt to surmise, that such a law is almost superfluous and unnecessary. There is such an immense disproportion between a block of marble, or a crawling reptile, and that Being who supports the system of universal nature, that it appears, at first view, next to impossible, that a reasonable being should ever become so stupid and degraded, as to substitute the one for the other, and to offer his adorations to an object completely devoid of life, power, and intelligence. Yet experience teaches us, that there is no disposition to which the human mind is more prone than “to depart from the living God,” and to multiply objects of

idolatrous worship. This will appear, if we take but the slightest glance of the objects of adoration which have prevailed, and which still prevail in the pagan world.

At one period of the world, with the single exception of the small nation of the Jews, idolatry overspread the face of the whole earth. And how numerous and degrading were the objects which the blinded nations adored! We are informed, by Hesiod, Varro, and other ancient authors, that no less than *thirty thousand* subordinate divinities were comprised within that system of idolatry which prevailed among the Greeks and Romans. They had both celestial and terrestrial deities. They assigned peculiar gods to the fountains, the rivers, the hills, the mountains, the lawns, the groves, the sea, and even to hell itself. To cities, fields, houses, edifices, families, gates, nuptial chambers, marriages, births, deaths, sepulchres, trees, and gardens, they also appropriated distinct and peculiar deities. Their principal *celestial* deities were Jupiter, Mars, Mercury, Apollo, Bacchus, Venus, Juno, and Minerva—their *terrestrial*, Saturn, Ceres, Diana, Neptune, Cybele, Proserpine, and Pluto. Their chief idol was Jupiter, whom they called the father of gods and men; and under his authority, Neptune had the jurisdiction of the sea, Juno, of the air, Cybele, of the earth, and Pluto, of the *realms below*. Instead of worshipping the living and immortal God, they deified a host of *dead men*, called heroes, distinguished for nothing so much, as for murder, adultery, sodomy, rapine, cruelty, drunkenness, and all kinds of debauchery. To such contemptible divinities, splendid temples were erected,\* adorations addressed, costly offerings presented, and rites and ceremonies performed, subversive of every principle of decency and morality, and degrading to the reason and the character of man.—A system of idolatry of a similar kind, though under a different form, prevailed among the Egyptians. The meanest and the most contemptible objects—sheep, cats, bulls, dogs, cows, storks, apes, vultures, and other birds of prey; wolves, and several sorts of oxen, were exalted as objects of adoration. “If you go into Egypt,” says Lucian, “you will see Jupiter with the face of a *ram*, Mercury as a fine *dog*, Pan, is become a *goat*; another god is *Ibis*, another the crocodile, and another the ape. There, many shaven priests gravely tell us, that the gods being afraid of the rebellion of the giants, assumed these shapes.” Each city and district in Egypt entertained a peculiar devotion for

\*The temple of *Diana* at *Ephesus*, has been always admired as one of the noblest pieces of architecture that the world ever produced. It was 425 feet long, 200 feet broad, and supported by 127 columns of marble 60 feet high; 27 of which were beautifully carved. Diodorus Siculus mentions, that the rich presents made to the temple of *Apollo* at Delphos, amounted to one million three hundred and thirty three thousand pounds.

some animal or other, as the object of its adoration. The city of Lentopolis worshipped a lion; the city of Mendes, a goat; Memphis, the Apis; and the people at the lake Myris, adored the crocodile. These animals were maintained, in or near their temples, with delicate meats; were bathed, anointed, perfumed, had beds prepared for them; and when any of them happened to die, sumptuous funerals were prepared in honour of the god. Of all these animals, the bull, *Apis*, was held in the greatest veneration. Honours of an extraordinary kind were conferred on him while he lived, and his death gave rise to a general mourning.

Such was the abominable idolatry that prevailed even among the most enlightened nations of antiquity. They changed the glory of the incorruptible God into "the similitude of an ox that eateth grass," and into images made like to corruptible man and to birds, and to four-footed beasts, and creeping things. And if the Egyptians, the Greeks, and the Romans, who are distinguished from the rest of the world for their improvements in literature, science, and the arts, had so far renounced their allegiance to the God of heaven, we may rest assured that the surrounding nations were sunk still farther into the pollutions of idolatry and of mental debasement. The Phenicians, the Syrians, the Canaanites, the Chaldeans and Babylonians, the Arabians, the Scythians, the Ethiopians, and the Carthaginians, the ancient Gauls, Germans, and Britons, were, if possible, more deeply debased; and mingled with their idolatrous rites, many cruel, obscene, and vile abominations.—Such is still the moral and religious debasement, even in modern times, of the greater part of the nations which dwell upon the earth. Even the Hindoos, the Birmans, the Chinese, the Persians, and the Japanese, though ranked among the most polished nations of the heathen world, are sunk into the grossest ignorance of the true God, and are found perpetrating, in their religious worship, deeds revolting to humanity, and stained with horrid cruelty and injustice.

The *moral effects* which were produced by a departure from this fundamental law of the Creator, were such as correspond with the abominations of that religious system which was adopted. Man is an imitative being; and he generally imitates the actions of those whom he conceives to be placed in a superior rank and station. When, therefore, the gods were introduced to his view, as swollen with pride, mad with rage, fired with revenge, inflamed with lust, engaged in wars, battles, and contests, delighting in scenes of blood and rapine, in hatred and mutual contentions, and in all kinds of riot and debauchery, it was natural to suppose that such passions and crimes would be imitated by their blinded votaries. Accordingly we find, that such vices universally prevailed, even among the

politest nations of antiquity; and some of their sacred rites, solemnized in honour of their gods, were so bestial and shocking, as to excite horror in every mind possessed of the least sense of decency and virtue. They gloried in the desolation and destruction of neighbouring nations. To conquer, and oppress, and enslave their fellow-men, and to aggrandize themselves by slaughter and rapine, was the great object of their ambition. The law of kindness and of universal benevolence was trampled under foot, and even the common dictates of humanity, equity, and justice, were set at defiance. But this was not all—Idolatry soon began to instigate its votaries to the perpetration of the most revolting and unnatural cruelties. Dreadful tortures were inflicted on their bodies, to appease their offended deities; human victims, in vast numbers, were sacrificed, and even their infants and little children were thrown into the flames, as an offering to the idol which they adored.

The Mexicans were accustomed to treat themselves with the most inhuman austerities, thinking that the diabolical rage of their deities would be appeased by human blood. "It makes one shudder," says Clavigero, "to read the austerities which they practised upon themselves, either in atonement for their transgressions, or in preparation for their festivals. They mangled their flesh as if it had been insensible, and let their blood run in such profusion, as if it had been a superfluous fluid in the body. They pierced themselves with the sharpest spines of the aloe, and bored several parts of their bodies, particularly their ears, lips, tongues, and the fat of their arms and legs." The priests of Baal, we are told, in the book of Kings, "cut themselves with knives and lancets, till the blood gushed out upon them." When the Carthaginians were vanquished by Agathocles, king of Sicily, they conceived that their god, Jupiter Latiavis was displeased with their conduct. In order to appease him, and propitiate his favour, they sacrificed to him, at once, *two hundred* sons of the first noblemen of their state. On the altars of Mexico, *twenty thousand* human beings are said to have been sacrificed every year; and *fifty thousand* were annually offered up in the various parts of that empire, accompanied with circumstances of such dreadful cruelty and horror, as makes us shudder at the recital. In Hindostan, even at the present day, several thousands of women are annually burned on the funeral piles of their deceased husbands, as victims to the religion they profess; besides multitudes of other human victims, which are crushed to death under the wheels of that infernal engine which supports the idol Juggernaut. Were the one hundredth part of the abominations which have been perpetrated under the system of idolatry, in those countries where it has prevailed, to be fully detailed, it would exhibit a picture of de-

pravity and of infernal agency, at which the human mind would shrink back with horror; and would form a striking commentary on the divine declaration, that "the dark places of the earth are full of the habitations of horrid cruelty."

It appears, then, that a violation of the first precept of the moral law is the greatest crime of which a rational creature can be guilty; for it is the source of all the other crimes which have entailed wretchedness on mankind, and strewed the earth with devastation and carnage. It is a comprehensive summary of wickedness; which includes pride, falsehood, blasphemy, malignity, rebellion, hatred of moral excellence, and the basest ingratitude towards Him from whom we derived our being, and on whom we depend for all our enjoyments. It is a crime which, above all others, has a tendency to *degrade* the character of man; for where it abounds, the human mind is sunk into the lowest state, both of moral and of intellectual debasement. What a pitiful and humiliating sight is it, and what emotions of astonishment must it excite in the mind of an archangel, to behold a rational and immortal intelligence cutting down an oak in the forest, burning part of it in the fire, baking bread, and roasting flesh upon its embers, and forming the residue of it into an idol, falling down and worshipping it, and saying, "Deliver me, for thou art my God!"\* And when we behold the same degraded mortal sacrificing the children of his own bowels before this stump of a tree, can we refrain from exclaiming, in the language of the prophet, "Be astonished, O ye heavens, at this; and be ye horribly afraid!" Were idolatry to become *universal* in the world, there is no crime, no species of cruelty, no moral abomination within the compass of the human heart to devise, but would soon be perpetrated without a blush, in the open face of day. Had not God, in his mercy, communicated a revelation of his will, in order to counteract the influence of Pagan theology,—instead of cultivating the powers of our minds, and expanding our conception of the Almighty, by a contemplation of his word and works, we might, at this moment, have been sunk into the lowest depths of moral degradation, been prostrating ourselves, in adoration, before a stupid ox or a block of marble, and sacrificing our sons and daughters to an infernal Moloch. It is one of the glories of Revelation, and a strong proof of its divine origin, that all its promises and threatenings, its admonitions and reproofs, its doctrines, its laws and ordinances, are directly opposed to every idolatrous practice; and that there is not a single instance in which the least countenance is given to any of the abominations of the Pagan world.

In the present age, and in the country in which

we reside, we are in little danger of relapsing into the practices to which I have now adverted. But idolatry is not confined to the adoration of Pagan divinities: it has its seat in every heart where God is banished from the thoughts, and where pride, ambition, and avarice occupy the highest place. "*Covetousness*," or an inordinate love of wealth, is declared by the Apostle Paul to be "*idolatry*;" and such mental idolatry, though more refined than that of the heathen world, is almost equally abhorrent to the Divine Being, and equally subversive of the grand principles of Christian morality. If the acquisition of wealth and riches be the constant and *supreme* aim of any individual, Mammon is the god whom he regularly worships, and the God of heaven is dethroned from his seat in the affections. Such moral effects as the following are the natural results of this species of idolatry: It steels the heart against every benevolent and generous emotion; it shuts the ears to the cries of the poor and needy; it engenders cheating, falsehood, and deceit; it prevents the man in whom it predominates from exerting his active powers, and from contributing of his wealth to promote the happiness of mankind; it chains down his noble faculties to the objects of time and sense; it leads him to love and to serve himself more than the Creator; it wraps him up in selfishness, and an indifference to the concerns of all other beings; it destroys the principles of equity and justice; it blunts the feelings of humanity and compassion; and prevents him from attending to the salvation of his soul, and from looking at those things which are unseen and eternal. And in every other case where a similar principle holds the supreme seat in the affections, similar effects will be produced.

#### THE SECOND COMMANDMENT.

*Thou shalt not make unto thee any graven image, nor any likeness of any thing that is in heaven above, or that is in the earth beneath, or that is in the waters under the earth: thou shalt not bow down thyself to them, nor serve them.*

The *first* commandment, which I have illustrated above, respects the *object* of our worship; forbidding us to substitute any other being in the room of God, or to offer it that homage which is due to the eternal Jehovah. This second commandment respects the *manner* in which he is to be worshipped. And in regard to the manner in which the Divine Being is to be contemplated and adored, it is expressly declared, that no *image* nor *representation* of this incomprehensible Being is at any time, or on any account, to be formed. This command, like the former, might at first sight appear to be unnecessary, if the almost universal practice of mankind had not taught us that there is no disposition which the

\* See Isaiah xlv. 9—21.

human mind is more apt to indulge, than to endeavour to bring the invisible Divinity within the range of our senses, and to contemplate him as such a one as ourselves. The necessity of this injunction, its reasonableness, and the folly and absurdity of the practice against which it is directed, will appear from the following considerations.

The Divine Being fills the immensity of space with his presence, and to his essence we can set no bounds. He inhabited eternity, before the earth or the heavens were brought into existence, rejoicing in the contemplation of his own excellences, and in the future effects of his power and benevolence. He is a spiritual uncompounded substance, and consequently invisible to mortal eyes, and impalpable to every other organ of sensation. His omnipotence neither man nor angel can scan, nor can they explore the depths of his wisdom and intelligence. When universal silence and solitude reigned throughout the infinite void—when not a sound was heard nor an object seen within the immeasurable extent of boundless space—at his command, worlds, numerous as the sand, started into being. Thousands of suns diffused their splendours through the regions of immensity; the ponderous masses of the planetary globes were launched into existence, and impelled in their rapid courses through the sky; their surfaces were adorned with resplendent beauties, and replenished with myriads of delighted inhabitants. The seraphim and the cherubim began to chant their hymns of praise, and “shouted for joy” when they beheld new worlds emerging from the voids of space. Life, motion, activity, beauty, grandeur, splendid illumination, and rapturous joy, among unnumbered intelligences, burst upon the view, where a little before nothing appeared but one immense, dark, and cheerless void. And ever since duration began to be measured, either in heaven or on earth, by the revolutions of celestial orbs, the same omnipotent energy has been incessantly exerted in directing the movements of all worlds and systems, and in upholding them in their vast career. Of a being invested with attributes so glorious and incomprehensible, with power so astonishing in its effects, with goodness so boundless, and with wisdom so unsearchable, what image or representation can possibly be formed which will not tend to contract our conceptions, and to debase the character of the infinite and eternal Mind! “To whom will ye liken me, or shall I be equal, saith the HOLY ONE.”

When a person of dignity and of respectability of character is caricatured, and associated with objects and circumstances that are mean, ridiculous, and grotesque, it has a tendency to degrade his character, and to lessen our veneration. For the respect we entertain for any individual is founded on the view we take of him in all the

aspects in which he may be contemplated. For a similar reason, every attempt to represent the Divine Majesty by sensible images, must have a tendency to narrow our conceptions of his glory, to debase his character, and to lessen our reverence and esteem. What possible similitude can there be between that mighty being, who by his word lighted up the sun, and diffused ten thousands of such immense luminaries through the regions of creation, whose hand wields the planets, and rolls them through the tracts of immensity; between him who “meteth out the heavens with a span, and holds the ocean in the hollow of his hand,” and the most resplendent image that was ever formed by human hands! Even the sun himself, with all his immensity of splendour, although our minds were expanded to comprehend his vast magnificence, would form but a poor and pitiful image of Him, whose breath has kindled ten thousand times ten thousand suns. How much less can a block of marble or a stupid ox adumbrate the glories of the King eternal, immortal, and invisible! It will doubtless redound to the eternal disgrace of the human character, in every region of the universe where it is known, that ever such an impious attempt was made by the inhabitants of our degenerate world, as to compare the glory of the incorruptible God to an image made like to corruptible man. Wherever such attempts have been made, there we behold human nature in its lowest state of debasement; the intellectual faculties darkened, bewildered, and degraded; the moral powers perverted and depraved; grovelling affections predominating over the dictates of reason, and diabolical passions raging without control. Hence, too, the debasing tendency of all those attempts which have been made to introduce into the Christian church, pictures and images, to represent “The invisible things of God,” and the sufferings of the Redeemer. For, wherever such practices prevail, the minds of men will generally be found to entertain the grossest conceptions of the Divine Being, and of the solemn realities of religion.

But the principal reason why any representation of God is expressly forbidden in this commandment, is, that whenever such a practice commences, it infallibly ends in adoring the *image itself*, instead of the *object* it was intended to represent. Or, in other words, the breach of this commandment necessarily and uniformly leads to a breach of the first. Notwithstanding the shock which the human mind appears to have received by the fall, it is altogether inconceivable, that any tribe of mankind should have been so debased and brutalized, as, in the first instance, to mistake a crocodile, or the stump of a tree, however beautifully carved, for the Creator of heaven and earth. Such objects appear to have been first used as *symbols* or representations of the Deity, in order to assist the mind in forming

a conception of his invisible attributes. But as they had a direct tendency to debase the mind, and to obscure the glory of the Divinity, in process of time they began to be regarded by the ignorant multitude as the very gods themselves, which they were at first intended to represent; and that tribute of adoration was paid to the symbol itself, which was originally intended to be given to the invisible God, through this sensible medium. And, when we contemplate kings and princes, poets and philosophers, heroes and sages, "young men and virgins, old men and children," whole provinces, nations, and continents, prostrating themselves before the shrine of such despicable and abominable idols, and the idea of the true God almost banished from the world, we have reason to feel ashamed, and to be deeply humbled, that we belong to a race of intelligences that have thus so grossly prostituted their rational and moral powers.

The only *natural* image or representation of God which is set before us for our contemplation, is, the boundless universe which his hands have formed; and his *moral* image is displayed in the laws which he has published; in the movements of his providence, and in the face of Jesus Christ his Son, who is "the image of the invisible God, and the brightness of his glory." All these exhibitions of the Divine Majesty, we are commanded to study, to contemplate, and admire; and it is essentially requisite in order to our acquiring correct and comprehensive views of the object of our adoration, that no one of these displays of the Divinity should be overlooked, or thrown into the shade. There are some Christians, who imagine they may acquire a competent knowledge of the character of God, although they should never spend a single moment in contemplating his perfections as displayed in his visible works. In regard to such, I hesitate not to affirm, that they are, to a certain extent, *idolaters*, and remain wilful idolaters, contented with the most inadequate and grovelling conceptions of the Deity, so long as they refuse to contemplate, with fixed attention, and with intelligence, the operations of his hands. If a man's ideas never extend beyond the bounds of his visible horizon, or beyond the limits of the country in which he resides, and if, at the same time, he has overlooked the most striking displays of divine wisdom and goodness within these bounds—his conceptions of the Divine Being himself, will nearly correspond with the conceptions he forms of his works. If his views be even confined within the limits of the globe on which he dwells, his conceptions of God will still be grovelling, distorted, and imperfect. And, therefore, the idea which such an individual forms to himself of God, may be inferior to that which is due to one of the higher orders of created intelligences. And, if so, he has only an image of a creature in his mind, instead of a comprehensive conception of

the Great Creator. We have too much reason to believe, that there are multitudes in the religious world, who pass for enlightened Christians, whose ideas of the Supreme Ruler of the universe do not rise beyond the conceptions we ought to form of the powers and capacities of Gabriel the archangel, or of one of the highest order of the seraphim.

We can never expect, from the very nature of things, to be able to explore the depths of Jehovah's essence, or to comprehend the whole range of his dominions and government. But, a large portion of his operations lies open to our inspection; and it is from an enlightened contemplation of what is presented to our view in the visible universe, that we are to form our conceptions of the grandeur of the Eternal Mind. For, it may be admitted as an axiom, both in natural and revealed theology, that *our conceptions of God will nearly correspond with the conceptions we acquire of the nature and extent of his operations*. In the universe around us, we perceive an image of his infinity, in so far as a finite and material existence can adumbrate the attributes of an Infinite and Invisible Existence. When we lift our eyes towards the midnight sky, we behold a thousand suns diffusing their splendours from regions of space immeasurably distant. When we apply a telescope to any portion of this vast concave, we perceive thousands more which the unassisted eye cannot discern. When we increase the magnifying powers of the instrument, we descry numerous orbs of light, stretching still farther into the unfathomable depths of space; so that there appear no limits to the scene of creating power. When the eye of reason penetrates beyond all that is visible through the most powerful telescopes, it contemplates a boundless region teeming with other resplendent suns and systems, whose number and magnificence overwhelm the imagination; so that no limit can be set to the excursions of the intellect when it wings its flight over the wide empire of Jehovah. Over all this vast assemblage of material splendour, over its movements, and over all the diversified ranks of intelligence it supports, God eternally and unchangeably presides. He is an *Infinite* Being;—and in this immense universe which he has opened to our view, he has given us an image of his infinity, which corresponds with the perfections which the inspired writers ascribe to him—and without a contemplation of which, the mind must have a very unworthy and circumscribed idea of the attributes of the Eternal Mind. Even in many of the objects which surround us in this lower world, we perceive an image of the infinity of the Creator—particularly in those living worlds which are contained in a few drops of water, some of the inhabitants of which are several hundreds of thousands of times smaller than the least grain of sand.—To the contempla-

tion of such objects we are directed by God himself, in order to acquire an impressive view of his character and operations. "Lift up your eyes on high, and behold who hath created these orbs, that bringeth out their host by number: he calleth them all by names, by the greatness of his might, for that he is strong in power."—And, the prophets, when reasoning against idolatry, present us with a train of thought similar to that to which I have now adverted. They describe the Almighty as "sitting on the circle of the heavens, and the inhabitants of the earth as grasshoppers in his sight." They represent him as "measuring the waters in the hollow of his hand, weighing the mountains in scales, and meting out the heavens with a span—before whom all nations are as the drop of a bucket, and are counted to him less than nothing and vanity."

It is strange, indeed, that the duty of contemplating the image of God as impressed upon his works, should be so much overlooked by the great body of the Christian world, notwithstanding the obvious reasonableness of this duty, and the pointed injunctions in relation to it which are reiterated in every department of the word of God. It is still more strange, that the instructions of many religious teachers have a tendency to dissuade Christians from engaging in this duty, by the foolish contrasts they attempt to draw between the word and the works of God; so that the great mass of Christians are left to remain half idolaters for want of those expansive conceptions of God which a knowledge of his works is calculated to produce.

It is also most unaccountable, on every principle of reason, and of Revelation, that the wilful neglect of this duty should never be accounted either as a sin, or as a want of that respect which is due to the Majesty of heaven. We have known persons rebuked, and even excluded from a Christian Church, for holding a metaphysical sentiment different from their brethren respecting the divine plans and decrees; but we never heard of an individual being either reproved or admonished by a Christian society, for neglecting to contemplate the character of God as displayed in his works, although he had lived fifty years amidst the magnificence of creation, and had acquired little more knowledge of his Creator, from this source, than the ox which browses on the grass. Yet, to this neglect is to be imputed a great proportion of those grovelling conceptions, superstitious notions, and distorted views of the doctrines of religion which still disgrace the Christian world. This fact is still more unaccountable, when we consider that a knowledge of the abstrusities and technicalities of science is not requisite in order to the performance of this duty. It requires only the eye of sense, of reason, and of devotion to be directed to the scene of divine operation within us, and around us, and to be occasionally fixed on the

object we contemplate, in order to appreciate the perfections and the glory of the ever present Deity. Although there were no other striking objects around us, the single fact of the apparent revolution of the celestial concave, with all its magnificent orbs, around the earth every twenty-four hours, is sufficient to overpower the mind of every rational observer with admiration and wonder, if his attention were seriously directed to it only for a single hour. The ideas of majesty, of grandeur, and of omnipotent energy which this single circumstance is calculated to inspire, are such as irresistibly to lead the mind to the contemplation of a Being whose perfections are incomprehensible, and whose ways are past finding out. Yet, I believe, it may be affirmed with truth, that more than one half of the Christian world are ignorant that such a fact exists;\* such is the indifference and the apathy with which many religionists view the wonderful works of God.

It was chiefly owing to such criminal inattention to the displays of the Divine Character in the works of creation, that the inhabitants of the Pagan world plunged themselves into all the absurdities and abominations of idolatry. "For the invisible things of God, even his eternal power and godhead, are clearly seen in the things that are made," if men would but open their eyes, and exercise their powers of intelligence. "The heavens declare the glory of Jehovah," they declare it to all the inhabitants of the earth. "There is no speech nor language where their voice is not heard: their line is gone out through all the earth, and their words to the end of the world."

"In reason's ear they all rejoice,  
And utter forth a glorious voice;  
For ever singing, as they shine,  
'The hand that made us is divine.'"

But the Heathen world did not listen to the instructions thus conveyed, nor did they apply their understandings, as they ought to have done, to trace the invisible things of God, from the visible displays of his character and perfections, in the universe around them. "They became vain in their imaginations, and their foolish hearts were darkened; and professing themselves to be wise, they became fools." While "the harp and the viol, the tabret, the pipe, and the wine were in their feasts, they regarded not the works of the Lord, nor considered the operations of his hands." "Wherefore they were given up by God to indulge" in vile affections, and "to worship and serve the creature rather than the Creator, who is blessed for ever." And, even under the

\* Here I refer simply to the *apparent* motion of the heavens—leaving every one to form his own opinion as to the other alternative—the motion of the earth. In either case the mind is overpowered with ideas of grandeur and of Almighty power. See this topic more particularly illustrated in "Christ. Philosopher."

Christian dispensation, we have too much reason to fear, that effects somewhat analogous to there have been produced, and a species of mental idolatry practised by thousands who have professed the religion of Jesus; owing to their inattention to the visible operations of Jehovah, and to their not connecting them with the displays of his character and agency as exhibited in the revelations of his word.

#### THE THIRD COMMANDMENT.

*Thou shalt not take the name of the Lord thy God in vain.*

The name of any person is that which distinguishes him from other individuals. Whatever word is employed to distinguish any object, whether animate or inanimate, is its name. In like manner, the Name of God is that by which he is distinguished from all other beings. It includes those terms which express his nature and character, as *Jehovah*—those titles by which his relation to his creation is designated, as “The Creator of the ends of the earth,—The Father of mercies,—The God of salvation,” &c.—the attributes of which he is possessed, as his Eternity, Omnipotence, Holiness, Justice, &c.—the works which he has exhibited in heaven and on earth—the movements of his Providence, and the Revelations of his word. By every one of these, the character of God is distinguished from that of all other beings in the universe. In relation to this name or character of the Divine Being, it is solemnly commanded that “we are not to take it in vain,”—that is, we are not to use any of the titles or designations of the Divine Majesty, for trifling, vain, or evil purposes; nor are we to treat any displays of his character with levity, profaneness, or irreverence.

We violate this command, when we use the name of God, in common discourse, in a light and irreverent manner, when we interlard our conversations with unnecessary oaths and asseverations in which this name is introduced; when we swear to what we know to be false, or when we multiply oaths in reference to vain and trifling concerns; when we imprecate curses and damnation on our fellow-creatures; when we approach God in prayer, without those feelings of reverence and awe, which his perfections demand; when we swear by any object in heaven or in earth, or by the false deities of the heathen world; when we treat his wonderful works with indifference or contempt; when we endeavour to caricature, and misrepresent them, or attempt to throw a veil over their glory; when we insinuate that his most glorious and magnificent works were made for no end, or for no end worthy of that infinite wisdom and intelligence by which they were contrived; when we overlook or deny the Divine Agency, which is displayed in the operations of nature; when we murmur and re-

pine at his moral dispensations, or treat the mighty movements of his providence, whether in ancient or in modern times, with a spirit of levity, with ridicule, or with contempt; when we treat the revelations of the Bible with indifference or with scorn; when we make the declarations of that book, which unfolds to us the sublime and adorable character of Jehovah, the subject of merriment and jest; when we endeavour to throw upon them contempt and ridicule, with the view of undermining their divine authority; and when we sneer at the public and private worship of God, and at the ordinances which he hath appointed.—In all these and many other ways, the name of God is profaned, his character reproached, and that reverence of the Divine Being, which is the foundation of all religion and moral order, undermined and subverted.

When the name or the titles by which a fellow-mortal is distinguished, are made the subject of banter and ridicule in every company, when they are brought forward for the purpose of giving an edge to a sarcastic sneer; and when his employments and the works he has constructed are contemned, and associated with every thing that is mean and degrading; it is an evidence of the low estimation in which he is held by the individual who does so, and has a tendency to debase his character in the eyes of others. On the same principle, the profanation of the name of God, has an evident tendency to lessen our admiration of the Majesty of Heaven, and to banish from the mind every sentiment of veneration and reverence. The man who can deliberately violate this command, from day to day,—thus offering a continual insult to his Maker—proclaims to all around, that he has no emotions of reverence and affection towards that Almighty Being, whose power upholds the fabric of heaven and earth, and who dispenses life and death to whomsoever he pleases. “He stretcheth out his hand against God, and strengtheneth himself against the Almighty.” He proclaims to every reflecting mind, that pride, enmity, rebellion, and irreverence, are deeply seated in his heart, and that “the fear of God,” and the solemnities of a future judgment “are not before his eyes.”

Were the violation of this law to become universal among men—the name of God, among all ranks, ages, and conditions of life, would be associated, not only with every trifling discourse and altercation, but with every species of ribaldry and obscenity. The lisping babe would be taught to insult that Mighty Being, from whom it so lately derived its existence; and the man of hoary hairs, even in the agonies of death, would pass into the eternal state, imprecating the vengeance of his Maker. All reverence for Jehovah would, of course, be banished from society; no temples would be erected to his honour; no silent adorations of the heart would ascend to his throne; no vows would be paid; no forms of worship ap-

pointed; no tribute of thanksgiving and gratitude would be offered to his name,—but the voice of profanity and of execration, among high and low, rich and poor, the young and the old, in every social intercourse, and in every transaction, would resound throughout all lands. No motives to excite to moral action, would be derived from the authority and the omnipresence of God, and from a consideration of his future retributions; for his character would be reproached, and his authority trampled under foot by all people. “They would set their mouths against the heavens in their blasphemous talk,” and they would say, “How doth God know, and is there knowledge in the Most High?” “What is the Almighty that we should serve him, and what profit shall we have, if we pray unto him?” “The Lord doth not see, neither doth the God of Jacob regard us.” His wonderful works would either be overlooked, or treated with contempt, or ascribed to the blind operation of chance or of fate. They would be represented as accomplishing no end, as displaying no wisdom, and as controlled by no intelligent agency. Their *apparent* irregularities and defects would be magnified, and expatiated upon with diabolical delight; while the glorious evidences they exhibit of infinite wisdom and beneficence would be thrown completely into the shade. The dispensations of his providence would be viewed as an inextricable maze, without order or design, directed by chance, and by the ever-varying caprice of human beings. His venerable word would universally become the subject of merriment and laughter,—a topic for the exercise of ribaldry and ridicule, and a theme for enlivening the unhallowed song of the drunkard. The most solemn scenes which it displays, and its most joyful and alarming declarations, would be equally treated with levity and contempt.—Such are some of the impious practices, and horrible effects which would follow, if the name of Jehovah were universally profaned. The very name of religion would be blotted out from the earth, its forms abolished, its sanctions disregarded, its laws violated, virtue and piety annihilated, the flood-gates of every evil burst open, and moral order entirely subverted.

On the other hand, universal reverence of the name and character of God would lead to the practice of all the duties of piety and morality. The Most High would be recognised with sentiments of veneration at all times; and the silent adorations of the heart would flow out towards him in all places; in the house, and in the street, in the bosom of the forest, and in the fertile plain, in the city, and in the wilderness, under the shades of night, and amidst the splendours of day. In every place, temples would be erected for his worship, hallelujahs of praise would ascend, and “incense and a pure offering” be presented to his name. With reverence and godly fear, with expansive views of his magnificence and glory,

with emotions of affection and of awe would his worshippers approach him in prayer, in praise, in contemplation, and in all the services of his sanctuary. The whole earth would be consecrated as one grand temple, from which a grateful homage would ascend from the hearts and from the lips of millions of devout worshippers, in all places, from the rising to the setting sun. In the domestic circle, in the social club, in the convivial meeting, in the streets, in “the high places of the city,” in the public walks, in the councils of the nations, and in every other intercourse of human beings, the name of God would never be mentioned nor his character alluded to, but with feelings of profound and reverential awe. His works would be contemplated with admiration, with reverence, and with gratitude, as proclaiming the glory of his kingdom, the depths of his wisdom, and the extent of his power. His mighty movements among the nations would be regarded with submission and reverence, as accomplishing the eternal purposes of his will, and his holy word would be perused by all classes of men with affection and delight, as the oracle which proclaims the glories of his nature and the excellence of his laws, the blessings of his salvation, and the path which conducts to eternal felicity in the life to come. Such are some of the delightful effects which would follow, were a sentiment of profound reverence to pervade the whole mass of human beings;—and corresponding sentiments of love and affection for each other, would be the necessary and unceasing accompaniments of respect and veneration for their common Parent.

#### THE FOURTH COMMANDMENT.

*“Remember the Sabbath day, to keep it holy. Six days shalt thou labour, and do all thy work; but the seventh day is the Sabbath of the Lord thy God,” &c.*

This commandment obviously enjoins the setting apart of one day in seven, as a day of rest from worldly labour, and as a portion of time to be devoted to the devotional exercises of religion, and particularly to the public worship of God. It was given forth, not merely to display the Sovereignty of the Lawgiver; but to promote both the sensitive and the intellectual enjoyment of man. “The Sabbath,” says our Saviour, “was made for man, and not man for the Sabbath.”

It was made for man, in the *first* place, as a day of rest. In this point of view, it is a most wise and merciful appointment, especially when we consider the present condition of mankind, as doomed to labour, and toil, and to the endurance of many sorrows. When we reflect on the tyrannical dispositions which prevail among mankind, on the powerful influence of avarice over the human mind, and on the almost total absence

of benevolence and compassion towards suffering humanity, wherever such dispositions predominate, we cannot but admire the wisdom and benevolence of the Creator, in the appointment of a weekly jubilee for the rest and refreshment of labourers spent with toil. On this day, the master has an opportunity of divesting his mind of worldly cares and anxieties, the servant of obtaining liberty and respite from his toilsome employments; and labourers of every class, of enjoying repose in the bosom of their families. Such, however, are the avaricious dispositions, and the contracted views of a great proportion of mankind, that they are apt to regard the institution of the Sabbath as an obstruction to the advancement of their worldly interests. They will calculate how much labour has been lost by the rest of one day in seven, and how much wealth might have been gained, had the Sabbath not intervened to interrupt their employments. But all such selfish calculations, even in a worldly point of view, proceed on the principles of a narrow and short-sighted policy. We know by experience, that, on the six days out of seven appointed for labour, all the operations requisite for the cultivation of the fields, and for the manufacture of every useful article for the comfort of mankind, can be performed with ease, and without the least injury to any class of men. And what more could be accomplished, although the Sabbath were converted into a day of labour? Were this violation of the divine command to become universal, it might be shown that, instead of producing an increase of wealth, it would infallibly produce an increase of toil and misery in relation to the great mass of mankind, without any corresponding pecuniary compensation. The labouring class at present receive little more wages than is barely sufficient to procure the necessities of life. If their physical strength would permit them to work eighteen hours a day, instead of twelve, it is beyond a doubt, that, in a very short time, the work of eighteen hours would be demanded by their employers for the price of twelve—particularly in all cases where a sufficient number of labourers can be easily obtained. In like manner, were the Sabbath to be used as a day of labour, the wages of seven days would soon be reduced to what is now given for the labour of six. In the first instance, indeed, before such a change was thoroughly effected, the labouring part of the community would acquire a seventh part more wages every week than they did before; and men unaccustomed to reflection, and who never look beyond a present temporary advantage, would imagine that they had acquired a new resource for increasing their worldly gain. But, in a very short time, when the affairs of the social state were brought to a certain equilibrium, they would be miserably undeceived; and the abolition of the Sabbath, instead of bringing along with it an increase of wealth, would carry

in its train an increase of labour,—a continued series of toilsome and unremitting exertions, which would waste their animal powers, cut short the years of their mortal existences, “make their lives bitter with hard bondage,” and deprive them of some of the sweetest enjoyments which they now possess.

And as the sabbath was appointed for the rest of man, so it was also intended as a season of repose for the *inferior animals* which labour for our profit. “The seventh day is the Sabbath of the Lord thy God; in it thou shalt not do any work, thou, nor thy son, nor thy daughter, thy man-servant, nor thy maid-servant, *nor thy cattle*, nor the stranger that is within thy gates.” This injunction exhibits the compassionate care and tenderness of the Creator in a very amiable and impressive point of view. It shows us, that the enjoyments of the lowest ranks of sensitive existence are not beneath his notice and regard. As he knew what degree of relaxation was necessary for the comfort of the labouring animals, and as he foresaw that the avarice and cruelty of man would endeavour to deprive them of their due repose, so he has secured to them, by a law which is to continue in force so long as the earth endures, the rest of one day in seven in common with their proprietors and superiors. And this privilege they will undoubtedly enjoy hereafter, in a more eminent degree than they have yet done, when man himself shall be induced to pay a more cordial and unreserved obedience to this divine precept,—when “he shall call the Sabbath a delight, and the holy of the Lord honourable.”

Again, the Sabbath was appointed for man, as a *season for pious recollection, and religious contemplation*. “Remember the Sabbath day, to keep it holy.” Amidst the numerous cares and laborious employments of human life, it is impossible to fix the mind, for any length of time, on the divine glory, as displayed in the works of creation, on the important facts and doctrines of revealed religion, and on the grand realities of the life to come. And, therefore, if the labouring classes enjoyed no regular season of repose for serious reflection, and religious instruction, the objects of religion would soon be entirely neglected, and the impression of a future world vanish from the mind. But in the wise arrangements of the beneficent Creator, an opportunity is afforded to all ranks of men for cultivating their moral and intellectual powers, and for directing them to the study and contemplation of the most glorious and interesting objects. As the Sabbath was originally instituted as a sacred memorial of the finishing of the work of creation, so it is obvious that the contemplation of the fabric of the universe, and of the perfections of its Almighty Author therein displayed, ought to form one part of the exercises of this holy day; and, consequently, that illustrations of this subject ought to be frequently brought

before the view of the mind in those discourses which are delivered in the assemblies of the saints. Since the references to this subject, throughout the whole of divine revelation, are so frequent and so explicit, it is evident, that the Creator intended that this amazing work of his should be contemplated with admiration, and make a deep and reverential impression upon every mind. To call to remembrance a period when there was no terraqueous globe, no sun, nor moon, nor planets, nor starry firmament, when darkness and inanity reigned throughout the infinite void—to listen to the voice of God resounding through the regions of boundless space, “LET THERE BE LIGHT; and light was”—to behold ten thousands of spacious suns instantly lighted up at his command—to trace the mighty masses of the planetary worlds projected from the hand of Omnipotence, and running their ample circuits with a rapidity which overwhelms our conceptions—to contemplate the globe on which we stand emerging from darkness and confusion to light and order; adorned with diversified scenes of beauty and of sublimity, with mountains, and plains, with rivers, and seas, and oceans; and with every variety of shade and colour; cheered with the melody of the feathered songsters, and with the voice of man, the image of his Maker, where a little before eternal silence had prevailed,—to reflect on the Almighty energy, the boundless intelligence, and the overflowing beneficence displayed in this amazing scene—has a tendency to elevate and expand the faculties of the human mind, and to excite emotions of reverence and adoration of the omnipotent Creator. This is a work which the eternal Jehovah evidently intended to be held in everlasting remembrance, by man on earth, and by all the inhabitants of the heavenly regions. It is the mirror of the Deity, and the natural image of the invisible God; and it forms the *groundwork* of all those moral dispensations towards his intelligent offspring, which will run parallel with eternity itself. And, therefore, to overlook this subject in the exercises of the Sabbath, is to throw a veil over the glories of the Deity, to disregard the admonitions of his word, and to condemn one of the most magnificent and astonishing displays of Divine perfection. “By the word of Jehovah were the heavens made, and all the host of them, by the breath of his mouth. He gathereth the waters of the sea together as an heap, he layeth up the depth in storehouses. Let all the earth fear the Lord; let all the inhabitants of the world stand in awe of him. For he spake, and it was done, he commanded, and it stood fast.”

This is a command which never was abrogated, and which never can be abrogated in relation to any intelligent beings, so long as the Creator exists, and so long as the universe remains as a memorial of his power and intelligence. Those sacred songs which are recorded in scripture for

directing the train of our devotional exercises, are full of this subject, and contain specimens of elevated sentiments, of sublime devotion, incomparably superior to what is to be found in any other record, whether ancient or modern.\* But man, whose unhallowed hand pollutes and degrades every portion of revelation which he attempts to improve, has either endeavoured to set aside the literal and sublime references of these divine compositions, or to substitute in their place the vague and extravagant fancies of weak and injudicious minds, for directing the devotional exercises of Christian churches.† As the book of God is the only correct standard of religious worship, so our devotional exercises both in public and in private, ought to be chiefly, if not solely, directed by the examples of devotion contained in the inspired writings, which are calculated to regulate and enliven the pious exercises of men of every age and of every clime.

But, the celebration of the work of creation is not the only, nor the principal exercise to which we are called on the Christian sabbath. Had man continued in primeval innocence, this would probably have constituted his chief employment. But he is now called to celebrate, in conjunction with this exercise, a most glorious deliverance from sin and misery, effected by the Redeemer of mankind. And, for this reason, the Sabbath has been changed from the seventh to the first day of the week, in memorial of the resurrection of Christ, when he was “declared to be the Son

\* See particularly Psalms 8, 18, 19, 29, 33, 65, 66, 68, 74, 99, 92, 93, 94, 95, 96, 100, 104, 107, 111, 135, 136, 139, 143, 146, 147, 148, &c. &c.

† I here allude to several collections of *Hymns* which have been introduced into the public worship of Christian societies—many of which, contain a number of vague and injudicious sentiments, and extravagant fancies, while they entirely omit many of those subjects on which the inspired writers delight to expatiate. This position could easily be illustrated by abundance of examples, were it expedient in this place. I am firmly of opinion, that the praises of the Christian church ought to be celebrated in *Scripture-language*—that selections for this purpose should be made from the book of Psalms, the Prophets, and the New Testament writers, which shall embody every sentiment expressed in the original, without gloss or comment, and be as nearly as possible in the very words of Scripture. This has been partly effected in many of the Psalms contained in metrical version, used in the Scottish Church, in which simplicity, and sublimity, and a strict adherence to the original, are beautifully exemplified. In this case there would be no need for a separate hymn-book for Baptists, Methodists, Independents, Presbyterians, and Episcopalians. But, when a poet takes an insulated passage of Scripture, and spins out a dozen stanzas about it, he may interweave, and most frequently does, as many fancies of his own as he pleases. Were the ideas contained in certain hymns to be painted on canvass, they would represent, either a congeries of clouds and mists, or a group of distorted and unnatural objects. And why should such vague fancies, and injudicious representations, be imposed on a Christian assembly? What a disgrace is thrown upon Christianity, when the different sects of Christians cannot cordially join together in the *same songs* of thanksgiving and praise to their common Father and Lord!

of God with power." In this deliverance, as in the first creation, a variety of the grandest and most interesting objects is presented to our view:—The Son of God manifested in the flesh—the *moral* image of the invisible Creator embodied in a human form, displaying every heavenly disposition, and every divine virtue, performing a series of the most astonishing and beneficent miracles, giving sight to the blind, and hearing to the deaf, making the lame man leap as a hart, and the tongue of the dumb to sing, restoring the infuriated maniac to the exercise of reason, commanding diseases to fly at the signal of a touch, recalling departed spirits from the invisible world, raising the dead to life, and, on every occasion, imparting heavenly instructions to attending multitudes. We behold this illustrious personage suspended on the cross, encompassed with the waters of affliction, and with the agonies of death; the veil of the temple rent in twain, from the top to the bottom—the rocks of mount Calvary rent asunder—the sun covered with blackness—darkness surrounding the whole land of Judea—the graves opening—the dead arising, and the Prince of Life consigned to the mansions of the tomb. On the third morning after this solemn scene, "a great earthquake" having shaken the sepulchre of the Saviour, we behold him bursting the prison-doors of the tomb, and awakening to a new life, which shall never end—we behold celestial messengers, in resplendent forms, descending from the ethereal regions to announce to his disconsolate disciples, that he who was dead "is alive, and lives for evermore;" we behold him, at length, bestowing his last benediction on his faithful followers, rising above the confines of this earthly ball, winging his way on a resplendent cloud, attended by myriads of angels, through distant regions which "eye hath not seen;" and entering "into heaven itself, there to appear in the presence of God for us." In the redemption achieved by this glorious person, we are directed to look back on that scene of misery in which sin has involved the human race, and to those "regions of sorrow and doleful shades," from which his mercy has delivered us; and to look forward to a complete deliverance from moral evil, to a resurrection from the grave, to a general assembly of the whole race of Adam—to the destruction and renovation of this vast globe on which we dwell, and to the enjoyment of uninterrupted felicity, in brighter regions, while countless ages roll away.—Such are some of the sublime and interesting objects which we are called upon to contemplate and to celebrate on the day appointed for the Christian sabbath—objects which have a tendency to inspire the mind with sacred joy, and with an anticipation of noble employments in the life to come.

Again, the Sabbath was appointed as a stated season for the public worship of God. As mankind are connected by innumerable ties, as they

are subject to the same wants and infirmities, are exposed to the same sorrows and afflictions, and stand in need of the same blessings from God,—it is highly reasonable and becoming, that they should frequently meet together, to offer up in unison their thanksgiving and praise to their common Benefactor, and to supplicate the throne of his mercy. These exercises are connected with a variety of interesting and important associations. In the public assemblies where religious worship is performed, "the rich and the poor meet together." Within the same walls, those who would never have met in any other circumstances, are placed exactly in the same situation before Him in whose presence all earthly distinctions vanish, and who is the Lord, and "the Maker of them all." Here, pride and haughtiness are abased; all are placed on the same level as sinners before Him "who is of purer eyes than to behold iniquity; the loftiness of man is humbled, the poor are raised from the dust, and the Lord alone is exalted in the courts of his holiness. Here, cleanliness and decency of apparel are to be seen, and human nature appears, both in its physical and its moral grandeur.\* Here, civility of deportment, and kindly affections are generally displayed. Here, we feel ourselves in the immediate presence of Him before whom all nations are as the drop of a bucket; we feel our guilty and dependant character, and stand, as suppliants, for mercy to pardon, and for grace to help us in the time of need. Here, knowledge of the most important kind is communicated to assembled multitudes, almost "without money and without price." Here, the poorest beggar, the youth, and the man of hoary hairs, may learn the character of the true God, and of Jesus Christ whom he hath sent—the way to eternal happiness—the sources of consolation under the afflictions of life—and the duties they owe to their Creator, and to all mankind. In a word, here the sinner, in the midst of his unhallowed courses, is aroused to consideration; and here the saint is animated and encouraged in his Christian journey, and enjoys a foretaste of the blessedness of heaven, and an earnest of the delightful intercourses and employments of "the saints in light."

Let us now suppose, for a moment, that the Sabbath, and its exercises, were *universally abolished* from the civilized world. What would be the consequences? The knowledge of the true God, which the institution of the Sabbath, more than any other mean, has tended to perpetuate, would soon be lost, his worship abandoned, and religion and moral principle buried in the dust. In Pagan countries, where the Sabbath is un-

\* What a striking contrast, even in a physical point of view, is presented between a modern assembly of Christian worshippers, and the hideous and filthy group of human beings that are to be seen in the kraal of a Hottentot, or in the cave of a New Hollander.

known, the true God is never adored, the soul of man is debased, and prostrates itself before the sun and moon, and even before demons, monsters, insects, reptiles, and blocks of wood and stone. In France, where the Sabbath was for a season abolished, an impious phantom, called the Goddess of Reason, was substituted in the room of the Omnipotent and Eternal God; the Bible was held up to ridicule, and committed to the flames; man was degraded to the level of the brutes; his mind was assimilated to a piece of clay, and the cheering prospects of immortality were transformed into the shades of an eternal night. Atheism, Scepticism, and Fatalism, almost universally prevailed; the laws of morality were trampled under foot; and anarchy, plots, assassinations, massacres, and legalized plunder, became "the order of the day."—With the loss of the knowledge of God, all impressions of the Divine presence, and all sense of accountability for human actions, would be destroyed. The restraints of religion, and the prospect of a future judgment, would no longer deter from the commission of crimes; and nothing but the dread of the dungeon, the gibbet, or the rack, would restrain mankind from the constant perpetration of cruelty, injustice, and deeds of violence. No social prayers, from assembled multitudes, would be offered up to the Father of mercies; no voice of thanksgiving and praise would ascend to the Ruler of the skies; the work of creation, as displaying the perfections of the Deity, would cease to be admired and commemorated; and the movements of Providence, and the glories of redemption, would be overlooked and disregarded. The pursuit of the objects of time and sense, which can be enjoyed only for a few fleeting years, would absorb every faculty of the soul; and the realities of the eternal world would either be forgotten, or regarded as idle dreams. In short, were the Sabbath abolished, or, were the law which enforces its observance to be reversed, man would be doomed to spend his mortal existence in an unbroken series of incessant labour and toil; his mental powers would languish, and his bodily strength would be speedily wasted. Habits of cleanliness, civility of deportment, and decency of apparel, would be disregarded; and the persons, and the habitations of the labouring classes, would soon resemble the filthiness and the wretched objects which are seen in the kraal of a Hottentot. Their minds would neither be cheered with the prospect of seasons of stated repose in this world, nor with the hope of eternal rest and joy in the world to come.

#### THE FIFTH COMMANDMENT.

*"Honour thy Father and thy Mother."*

The four preceding commandments, whose importance I have endeavoured to illustrate, were written on a separate tablet from those that follow,

and have been generally considered as enjoining the practice of piety, or those duties which more immediately respect God as their object. But they also include the duties we owe to ourselves; for in yielding obedience to these requirements, we promote our best interests in this world, and are gradually prepared for participating in the enjoyments of the world to come. These laws are binding upon angels and archangels, and upon every class of intelligent beings, in whatever quarter of the universe their local residence may be found, as well as upon the inhabitants of the earth. The fourth commandment, indeed, in so far as regards the *particular portion of time* to be set apart for the worship of God, may possibly be peculiar to the inhabitants of our world. Even although the inhabitants of such a world as the planet Jupiter were commanded to set apart every seventh natural day for the stated public worship of God, the proportion of absolute time allotted for this purpose, would not be the same as ours; for the natural day in that world is equal to only ten hours of our time. But the spirit of this precept, or, the principle on which it is founded, must be common to all worlds. For we can conceive of no class of intelligent creatures, on whom it is not obligatory to devote a certain portion of time for the social worship and adoration of their Creator, and for commemorating the displays of his Power and Benevolence; and all holy intelligences will cheerfully join in such exercises, and will consider it as a most ennobling and delightful privilege, to engage at stated seasons, along with their fellow-worshippers, in admiring and extolling the Uncreated Source of their enjoyments. But the stated seasons appointed by the Creator for such solemn acts of worship, the manner and circumstances in which they shall be performed, and the number of worshippers that may assemble on such occasions, may be different in different worlds, according to the situations in which they are placed.

The fifth commandment, to which I am now to advert, is one of those moral regulations which may possibly be peculiar to the relations which exist in our world; at least, it cannot be supposed to apply to the inhabitants of any world where the relations of parents and children, of superiors and inferiors, are altogether unknown. But, in the circumstances in which man is placed, it is a law indispensably requisite for preserving the order and happiness of the social system.—It requires the exercise of those dispositions, and the performance of those duties, which are incumbent upon mankind, in the *various relations in which they stand to each other*. It, consequently, includes within its spirit and references, the duties which children owe to their parents, and parents to their children; the duties of husbands and wives, of masters and servants, of teachers and scholars, of brothers and sis-

ters, of the young and the old, and of governors and their subjects; together with all those dispositions of reverence, submission, affection, gratitude, and respect, with which the performance of these duties ought to be accompanied. It must also be considered as forbidding every thing that is opposed to these dispositions, and to the obedience required; as contumacy, rebellion, and want of respect, on the part of children towards their parents; disobedience of servants to the reasonable commands of their masters; and every principle of disaffection and of insubordination among the various ranks of society. That all this is included within the range of this precept, might be proved from the principles on which our Saviour explains the sixth and seventh commandments, in his Sermon on the Mount, and from the illustrations of these duties which are given in the Apostolic epistles, and in other parts of Scripture.

As it forms no part of my plan, to enter into any particular explanations of the duties required in the Decalogue, which have frequently been expounded by many respectable writers, in works particularly appropriated to this object,—I shall simply illustrate, in a few words, the reasonableness of this, and the following precepts, from a consideration of the effects which would follow, were these laws either universally observed, or universally violated.

Were this law to be reversed, or universally violated, it is impossible to form an adequate conception of the dreadful scene of anarchy and confusion which would immediately ensue. Every social tie would be torn asunder, every relation inverted, every principle of subordination destroyed, every government overturned, every rank and order of mankind annihilated, and the whole assembly of human beings converted into a discordant mass of lawless banditti. Every family would present a scene of riot, confusion, insubordination, contention, hatred, tumult, and incessant execration. Instead of love, peace, unity, and obedience, the son would rise in rebellion against his father, and the father would insult and trample under foot his son. To use the words of our Saviour, "The brother would deliver up the brother to death, and the father the child; and the children would rise up against their parents, and cause them to be put to death; the daughter would be set at variance against her mother, and the daughter-in-law against her mother-in-law; and a man's foes would be they of his own household." Children would be unprovided with proper food, clothing, and instruction, and left to wander, homeless and forlorn, as vagabonds on the face of the earth; and parents, abandoned by their children, in sickness, poverty, and old age, would sink into the grave in wretchedness and despair. The young, instead of "rising up before the hoary head, and honouring the face of the old man," would treat

the aged and infirm with every mark of scorn, derision, and contempt; and would feel a diabolical delight in vexing, thwarting, and overpowering their superiors in age and station. No instructions could be communicated by teachers and guardians to the rising generation; for riot, insolence, insult, derision, and contempt, would frustrate every effort to communicate knowledge to a youthful group. No building nor other work of art could be commenced with the certain prospect of being ever finished; for its progress would depend upon the whims and humours of the workmen employed, who, of course, would rejoice in endeavouring to frustrate the plans and wishes of their employers. No regular government nor subordination in a large community, could possibly exist; for the great mass of society would endeavour to protect every delinquent, and would form themselves into a league to prevent the execution of the laws. These effects would inevitably follow, even although the requisition contained in this precept, were to be viewed as confined solely to the reverence and obedience which children owe to their parents. For, were this obedience withdrawn, and an opposite disposition and conduct uniformly manifested, the young would carry the same dispositions which they displayed towards their parents, into all the other scenes and relations of life, and fill the world with anarchy and confusion. But it would be needless to expatiate on this topic, as it appears obvious to the least reflecting mind, that a universal violation of this law would quite unhinge the whole fabric of society, and would soon put an end to the harmonious intercourse of human beings.

On the other hand, a constant and universal obedience to this precept would produce such effects on the deformed aspect of our world as would transform it into a paradise of moral beauty, of happiness and love. Every family would exhibit a picture of peace and concord, of harmony and affection. No harsh and bitter language, no strifes, nor jars, nor contentions would ever interrupt the delightful flow of reciprocal affection between parents and children. No longer should we behold the little perverse members of the domestic circle, indulging their sulky humours, and endeavouring to thwart the wishes of their superiors, nor the infuriated parent stamping and raging at the obstinacy of his children; nor should we hear the grating sounds of discord, and insubordination which now so frequently issue from the family mansion. Every parental command would be cheerfully and promptly obeyed. Reverence and filial affection would glow in every youthful breast towards the father that begat him, and towards the mother that gave him birth. Their persons, and their characters would be regarded with veneration and respect, and their admonitions submitted to without a murmur or complaint. To gladden

the hearts of their parents, to run at the least signal of their will, to share in their benignant smile or approbation, and to avoid every species of conduct that would produce the least uneasiness or pain—would be the unceasing aim of all the youthful members of the family circle. In sickness, they would smooth their pillows, and alleviate their sorrows, watch like guardian angels around their bed, drop the tear of affection, and pour the balm of consolation into their wounded spirits. In the decline of life, they would minister with tenderness to their support and enjoyment, guide their feeble steps, sympathize with them in their infirmities, cheer and animate their dejected spirits, and render their passage to the tomb smooth and comfortable. And how delighted would every parent feel amidst such displays of tenderness and affection! There is perhaps nothing in the whole range of human enjoyment that creates a higher and more unmingled gratification to parents, than the dutiful and affectionate conduct of their offspring. It sweetens all the bitter ingredients of human life, and adds a relish to all its other comforts and enjoyments. It imparts a continual satisfaction and serenity to the parental breast; it smooths the wrinkles of age; it cheers the spirits under the infirmities of declining nature, and makes the dying bed of old age comfortable and easy. And the joy and satisfaction thus felt by parents would be reflected into the bosom of their children; which would produce a union of interests, a cordiality of affection, and a peace and tranquillity of mind in every member of the family, which no adverse occurrence in future life could ever effectually destroy.

From the family circle the emanations of filial piety would spread and diffuse themselves through all the other departments of society. The same spirit of love and dutiful respect which united and endeared parents to children, and children to parents, would unite one family to another, one village to another, one city to another, one province to another, one kingdom and empire to another, till all the tribes of the human race were united in kindness and affection, as one great and harmonious family. Every dutiful child would become a faithful and obedient servant, a docile scholar, and a loyal and submissive subject, when placed in those relations; and would prove a blessing and an ornament to every society of which he was a member. And every dutiful and affectionate parent, when placed in the station of a king, or a subordinate ruler, would display a parental affection towards every member of the community over which he was appointed. Hence it might easily be shown, that an uninterrupted and universal observance of this single precept, viewed in all its connexions and bearings, would completely regenerate the world—and that the peace, the harmony, and the prosperity of all the nations of the earth, will ulti-

mately depend on the spirit of filia. piety being infused into every family. "Honour thy father and thy mother," says the Apostle, "which is the first commandment with promise; that it may be well with thee, and that thou mayest live long upon the earth." These words, which are frequently repeated in Scripture, are not empty sounds; nor ought they to be deprived, even under the Christian dispensation, of their obvious and literal meaning. Filial piety has a natural tendency to produce health, long life, and prosperity; and could we trace the whole of the secret history of Providence in reference to this precept, we should, doubtless, find this position abundantly exemplified. At any rate, were it universally practised, it would carry along with it a train of blessings which would convert the tumults and convulsions of nations into peace and tranquillity, and transform the moral wilderness of this world into a scene of verdure, beauty, and loveliness, which would enrapture the mind of every moral intelligence; and among its other benefits, "length of days, and long life and peace," would undoubtedly "be added" to the other enjoyments of mankind.

#### THE SIXTH COMMANDMENT.

*"Thou shalt not kill."*

This precept forbids the taking away of the life of sensitive or intelligent existence. The command is absolute, without the least exception, as it stands in the Decalogue; and it is universal, extending to every rational and moral agent. It implies that, as every sensitive and every intelligent being derived its existence from the omnipotent Creator of heaven and earth, no one has a right to deprive it of that existence, except that Being by whom it was bestowed. And, whatever exceptions to the universality of this law may be admitted, they can be admitted only on the authority of the Lawgiver himself, who is the Original Fountain of existence to all his creatures. The principal exceptions to this law are the following:—1. The man who has violently taken away the life of another is commanded, by the authority of God, to be put to death. "Whoso sheddeth man's blood, by man shall his blood be shed." This is the dictate of reason as well as of revelation; for no human power can recall the departed spirit or re-animate the lifeless corpee, and no adequate compensation can ever be given for such a crime.\* 2. The life of the lower animals is permitted by the same

\* Notwithstanding the considerations here stated, the Author is doubtful whether the Creator has conceded to man the right of taking away the life of another, even in case of murder. If the passage here quoted ought to be considered as a prediction rather than a law, as is most probable, it will afford no warrant for the destruction of human life; and there is no other injunction of this kind which has any relation to the New Testament dispensation.

authority to be taken away when *these animals are necessary for our food, or when they endanger our existence*. This permission was first granted, immediately after the flood, to Noah and his descendants. "God said to Noah and his sons; every thing that moveth shall be meat for you; even as the green herb have I given you all things." Without such a positive grant from the Creator, man could have had no more right to take away the life of an ox or a sheep, than he has to imbrue his hands in the blood, or to feast on the flesh of his fellow-men. To take the life of any sensitive being, and to feed on its flesh, appears incompatible with a state of innocence; and, therefore, no such grant was given to Adam in paradise; nor does it appear that the Antediluvians, notwithstanding their enormous crimes, ever feasted on the flesh of animals. It appears to have been a grant suited only to the degraded state of man after the deluge; and, it is probable, that as he advances in the scale of moral perfection, in the future ages of the world, the use of animal food will be gradually laid aside, and he will return again to the productions of the vegetable kingdom, as the original food of man, and as that which is best suited to the rank of rational and moral intelligence. And, perhaps, it may have an influence, in combination with other favourable circumstances, in promoting health and longevity. —But, although the inferior animals are, in the mean time, subjected to our use, no permission is granted to treat them with harshness or cruelty, or to kill them for the sake of sport and amusement. And, therefore, the man who wantonly takes away the lives of birds, hares, fishes, and other animals, for the mere gratification of a taste for hunting or fishing, can scarcely be exculpated from the charge of a breach of this commandment.

The above are the principal exceptions which the Creator has made in reference to the law under consideration. And it may not be improper to remark, that, besides the direct act of murder, every thing that leads to it, or that has a tendency to endanger life, is to be considered as forbidden in this commandment. All unkindness and harsh treatment exercised towards servants, dependants, and brute animals, by which life may be shortened or rendered intolerable—all furious and revengeful passions, which may lead to acts of violence—all quarrelling, fighting, and boxing, either for bets, or for the gratification of hatred or revenge—all wishes for the death of others, and all contrivances either direct or indirect to compass the destruction of our neighbour—all criminal negligence by which our own life or the life of others may be endangered or destroyed—and all those actions by which murder may be committed as a probable effect, as the burning of inhabited houses, and the throwing of the instruments of death into the midst of a crowd—are to be regarded as involv-

ing the principle of murder, as well as the direct acts of suicide, duelling, and assassination; and, consequently, as violations of that law which extends to the secret purposes of the heart, as well as to the external actions. Even unreasonable anger, malice, and scurrility are declared by our Saviour to be a species of murder: "Whosoever is angry with his brother without a cause, shall be in danger of the judgment, and whosoever shall say to his brother, *Raca*," that is, thou worthless empty fellow, "shall be in danger of the council."\* Life is desirable only as it is connected with enjoyment, and, therefore, when a man treats his brother with such a degree of hatred and scurrility, as to render his existence either unpleasant or intolerable, he ought to be ranked among the class of murderers. For the apostle John declares, without the least limitation, that "whosoever hateth his brother is a murderer, and he that loveth not his brother abideth in death." And, if this criterion be admitted, a train of murderers will be found existing in society far more numerous than is generally supposed.

It would be needless to attempt an illustration of the consequences which would ensue, were the breach of this law to become universal. It is obvious, on the slightest reflection, that were this to happen, human society would soon cease to exist. That prophecy which was given forth respecting Ishmael would then receive a most terrible and extensive accomplishment, in the case of every human agent: "His hand shall be against every man, and every man's hand against him." Every man would assume the character of an infernal fiend; every lethal weapon would be prepared and furnished for slaughter; every peaceful pursuit and employment would be instantly abandoned; the voice of wailing and the yells of fury and despair, would be heard in every family, in every village, in every city, in every field, in every kingdom, and in every clime. Every house, every street, every valley, every forest, every river, every mountain, and every continent would be strewn with fearful devastation, and with the mangled carcasses of the slain. The work of destruction would go on with dreadful rapidity, till the whole race of man were extirpated from the earth, leaving this vast globe a scene of solitude and desolation, an immense sepulchre, and a spectacle of horror to all superior intelligences.—And, let it be remembered, that such a picture, horrible and revolting as it is, is nothing more than what would be the re-

\* Math. v. 22. Christ, in this passage, refers to a court among the Jews, composed of *seventy-three men*, wherein capital sentences might be passed on which a malefactor might be strangled or be headed; this was called *the Judgment*. But the Sanhedrim, or *Council*, was the supreme Jewish court, consisting of *seventy-two*; in which the highest crimes were tried, which they, and they alone, punished with *stoning*, which was considered a more terrible death than the former.

atural result of the principle of *hatred*, were it left to its native energies, and were it not controlled, in the course of providence, by Him who sets restraining bounds to the wrath of man.

In order to counteract the tendencies of this baleful principle, it is of the utmost importance that youth be trained up in habits of kindness, tenderness, and compassion, both towards human beings, and towards the inferior animals; that an abhorrence should be excited in their minds of quarrelling, fighting, and all mischievous tricks and actions; that they be restrained from the indulgence of malicious and resentful passions; that every indication of a cruel and unfeeling disposition be carefully counteracted; and that every tendency of the heart towards the benevolent affections, and every principle of active beneficence be cultivated and cherished with the most sedulous care and attention. For, in youth, the foundation has generally been laid of those malevolent principles and passions which have led to robbery, assassination, and deeds of violence,—which have filled the earth with blood and carnage: and which have displayed their diabolical energy in so dreadful a manner amidst the contests of communities and nations.

Were the disposition to indulge hatred, which leads to every species of murder, completely counteracted, the greatest proportion of those evils which now afflict our world, would cease to exist. Human sacrifices would no longer bleed upon Pagan altars; the American Indians would no longer torture to death their prisoners taken in war, nor the New Zealanders feast upon the flesh and the blood of their enemies. The widows of Hindostan would no longer be urged to burn themselves alive on the corpses of their deceased husbands; nor would the mothers of China imbrue their hands in the blood of their infant offspring. The practice of *Duelling* would forever cease, and would be universally execrated as an outrage on common sense, and on every generous and humane feeling, and as the silly attempt of a puny mortal to gratify wounded pride or disappointed ambition, at the expense of the life of his fellow-creature. Despotism would throw aside its iron sceptre, and the nations would be ruled with the law of love; and plots, conspiracies, treasons, and massacres would be attempted no more. The fires of the Inquisition would cease to be kindled, the supposed heretic would no longer be consigned to the horrors of a gloomy dungeon, racks and gibbets and guillotines would be shivered to pieces and thrown into the flames, and the spirit of cruelty and persecution would be extirpated from the earth. Riot, tumult, and contention would be banished from our streets, and harmony and concord would prevail throughout all our borders. War would forever cease to desolate the nations; the confused noise of invading armies, the sounds of martial music,

the groans of dying victims, and the hoarse shouts of conquerors, would be heard no more. Peace would descend from heaven to dwell with man on earth; prosperity would follow in her train, science would enlarge its boundaries and shed its benign influence upon all ranks; the useful arts would flourish and advance towards perfection; philanthropy would diffuse its thousand blessings in every direction, and every man would sit “under his vine and fig-tree” in perfect security from all danger or annoyance.

#### SEVENTH COMMANDMENT.

*“Thou shalt not commit adultery.”*

This commandment is to be viewed as comprehending within its prohibition, every species of lewdness, both in thought, word, and action; as adultery, fornication, incest, polygamy, &c.; and likewise all those licentious desires and affections from which such actions proceed. In this comprehensive sense it is explained by our Saviour, in his Sermon on the Mount, and by the Apostles, in their letters to the Christian Churches. It is founded on the distinction of sexes which exists among mankind, and on the law of Marriage, which was promulgated immediately after the creation of the first pair—a law which was intended to limit, and to regulate the intercourse of the sexes; and to promote purity, affection, and order, among the several generations of mankind. By this law the marriage union is limited to two individuals. He who made mankind at the beginning, says Christ, made them male and female, and said, “For this cause shall a man leave father and mother and shall cleave to his wife; and they twain shall be one flesh.” And, it might easily be shown, from an induction of facts, and from a consideration of the present circumstances of the human race, that this law, and this alone, is calculated to promote the mutual affection of the married pair, and to secure the peace and happiness of families, and the harmony of general society. By this law the union is made permanent, so long as the parties exist in this world. “What God hath joined, let no man put asunder.” This regulation has a tendency to promote union of affection and interests, and to induce the parties to bear with patience the occasional inconveniences and contentions which may arise. Were divorces generally permitted, on the ground of unsuitableness of temper, or occasional jars, society would soon be shaken to its centre. Every real or supposed insult, or provocation, would be followed out, till it terminated in the separation of the parties; families would thus be torn into shreds; the education of the young would be neglected; parental authority disregarded; and a door opened for the prevalence of unbounded licentiousness. Soon after the commencement of the Re-

revolution in France, a law, permitting divorces, was passed by the National Assembly; and, in less than three months from its date, nearly as many divorces as marriages were registered in the city of Paris. In the whole kingdom, within the space of eighteen months, upwards of twenty thousand divorces were effected; and the nation sunk into a state of moral degradation, from the effects of which it has never yet recovered. This is one of the many practical proofs presented before us, of the danger of infringing on any of the moral arrangements which the Creator has established.

The precept under consideration is to be considered as directly opposed to all promiscuous and licentious intercourse between the sexes. And the reasonableness of this prohibition will appear, if we consider, for a moment, what would be the consequences which would inevitably follow were this law to be set aside, or universally violated. A scene of unbounded licentiousness would ensue, which would degrade the human character, which would destroy almost all the existing relations of society, and unhinge the whole fabric of the moral world.—One end of the institution of marriage was, to “replenish the earth” with inhabitants, to perpetuate the successive generations of men, and to train up a virtuous and intelligent race to people the congregation of the heavens. But this end would be ultimately frustrated, were a promiscuous and unlimited intercourse to become either general or universal. For, it has been found, that, wherever such intercourse partially prevails, it strikes at the root of human existence, and has a tendency to prevent the operation of that law which the Creator impressed on all living beings, “Increase and multiply.” In the haunts of licentiousness, in large cities, and in all such societies as those which formerly existed in Otaheite, under the name of *Arreey*, the laws of nature are violated, the course of generation obstructed, and numbers of human beings strangled at the very porch of existence. So that were mankind at large to relapse into such licentious practices, the human race instead of increasing in number, to replenish a desolate waste of our globe, according to the Creator’s intention, would rapidly decrease every succeeding generation, till after the lapse of a few centuries, human beings would be entirely extirpated, and the earth, barren and uncultivated, would be left to the dominion of the beasts of the forest.

But, although such a distant event were to be altogether disregarded, the immediate consequences of such unhallowed courses would be dismal in the extreme. That union of heart, affection, and of interests, which subsists between the great majority of married pairs, and those reciprocal sympathies and endearments which flow from this union, would be altogether unknown. The female sex, (as already happens in some nations,) with minds uncultivated and unpolish-

ed, would be degraded into mere instruments of sensitive enjoyment, into household slaves, or into something analogous to beasts of burden, and would be bought and sold like cattle and horses. The minds of all would be degraded to the level of brutes, and would be incapable of prosecuting either rational or religious pursuits. Their bodies would be wasted and enfeebled with squalid disease: the infirmities of a premature old age would seize upon them; and before they had “lived half their days,” they would sink into the grave in hopelessness and sorrow. A universal sottishness, and disregard of every thing except present sensual enjoyment, would seize upon the whole mass of society, and benumb the human faculties: the God of heaven would be overlooked, and the important realities of an immortal existence completely banished from their thoughts and affections. Thousands, and ten thousands of infants would be strangled at their entrance into life; and the greater part of those who were spared, would be doomed to a wretched and precarious existence. The training up of the youthful mind to knowledge and virtue would be quite neglected; and all that civility and softness of manners, which are now acquired under the eye of parental authority and affection, would be unknown in society. The endearing relations of father and mother, of brothers and sisters, of uncles, aunts, and cousins, and all the other ramifications of kindred, which now produce so many interesting and delightful associations, would fail to be recognised among men; for in such a state of society, the natural relations of mankind would be either disregarded, or blended in undistinguishable confusion.

Children, neglected or abandoned by their mothers, would be left to the full influence of their own wayward and impetuous passions; they would depend for subsistence, either on accident, on pilfering, or on the tender mercies of general society; they would wander about as vagabonds, tattered and forlorn; their hearts shrivelled with unkindness, their bodies chilled with the rains and biting frosts, and deformed with filthiness and disease. They would be left to perish in the open fields, without a friend to close their eyes; and their bodies, unnoticed and unknown, would remain as a prey, to be devoured by the fowls of heaven. In every land would be seen multitudes of homeless and shivering females, set adrift by their seducers, wandering with their hungry and half famished offspring, the objects of derision and contempt; and imploring, in vain, the comforts of food, of shelter, and protection. For, among human beings, in such a degraded state, the kindly and benevolent affections would seldom be exercised; cold-blooded selfishness and apathy, in relation to the sufferings of others, would supplant all the finer feelings of humanity; which would dispose them to view the wretched objects around them with perfect indifference,

and even with contempt. "However it may be accounted for," says Dr. Paley, "the criminal commerce of the sexes corrupts and depraves the mind, and the moral character, more than any single species of vice whatsoever. That ready perception of guilt, that prompt and decisive resolution against it, which constitutes a virtuous character, is seldom found in persons addicted to these indulgences. They prepare an easy admission for every sin that seeks it; are, in low life, usually the first stage in men's progress to the most desperate villainies; and, in high life, to that lamented dissoluteness of principle which manifests itself in a profligacy of public conduct, and a contempt of the obligations of religion and of moral probity. Add to this that habits of libertinism incapacitate and indispose the mind for all intellectual, moral, and religious pleasures."<sup>\*</sup>

In short, in such a state of society as would inevitably accompany a general violation of the seventh precept of the moral law, all the softness and loveliness of filial piety, of parental affection, of brotherly attachment, and of the intercourse of kindred, would forever cease; science and literature would be neglected; and churches, colleges, schools, and academies would crumble into ruins: a sufficient stimulus would be wanting to the exercise of industry and economy; a lazy apathy would seize upon the mass of society; the earth would cease to be cultivated, and would soon be covered with briars and thorns, or changed into the barren wastes of an African desert. The foundation of all regular government would be undermined; for it is chiefly in those habits of submission and obedience which are acquired under the domestic roof, that the foundations are laid of that subordination which is necessary to secure the peace and order of mankind. Society would, consequently, be thrown into a state of disorder, and would speedily sink into oblivion, in the mire of its own pollution.

The positions now stated could be illustrated, were it expedient, by a variety of melancholy facts, borrowed from the history and the present state, both of savage and of civilized nations. The annals of Turkey, of Persia, of Hindostan, of China, of Japan, of the Society Isles, and even of the civilized nations of Europe and America, would furnish abundance of impressive facts, to demonstrate the demoralizing, and brutalizing, and miserable effects which would flow from a spirit of universal licentiousness—What revolting scenes would open to view, were we to survey the haunts of licentiousness which abound in Algiers, in Constantinople, in Teheran, in Pekin, in Canton, in Jeddo, and other populous cities, where the restraints of

Christianity are altogether unknown! In such receptacles of impurity, every moral feeling is blunted, and every moral principle abandoned. Impiety, profanity, falsehood, treachery, perjury, and drunkenness, rear their unblushing fronts; and thefts, robberies, and murders, follow in their train. The unhappy female who enters those antechambers of hell, is, for the most part, cut off from all hopes of retreat. From that moment, the shades of moral darkness begin to close around her; she bids a last adieu to the smiles of tenderness and sympathy, to the kind embraces of father and mother, of sisters and brothers, to the house of God, to the instructions of his word, and to the society of the faithful. Instead of the cheering sounds of the Gospel of peace, her ears become accustomed to oaths, and curses, and horrid imprecations; the voice of conscience is hushed amidst the din of revelry and riot; every generous feeling is shrunk and withered; she stalks abroad like a painted corpse, to fill with horror the virtuous mind, and to allure the unwary to the shades of death; till at length, wasted with consumption and loathsome disease, she is stretched upon the bed of languishing, abandoned by her former associates, deprived of the least drop of consolation, haunted with the ghastly apparitions of departed joys, and the forebodings of futurity, and sinks, "in the midst of her days," into the chambers of the grave, without the least hope of a glorious resurrection.—And if we consider, that this is a picture of the wretchedness, not only of a few individuals, but of thousands, of tens of thousands, and of millions of human beings, it is impossible to describe the accumulated mass of misery which impurity has created, or to form any adequate conception of the horrible and revolting scenes of wretchedness which would be displayed, were the law under consideration to be set aside by all the inhabitants of our globe.

There is a certain levity and flippancy of speech in relation to this subject, which prevails among many who wish to be considered as respectable characters, which proceeds from a contracted view of the consequences of human actions. They conceive, that no great harm can be done to society, by a few insulated actions of the kind alluded to, especially if they be concealed from general observation; and that the Creator will be disposed to make every allowance for human frailty. But let such remember that, if it were right to violate this, or any other law of the Creator, in one instance, it would be right in a hundred, in a thousand, in a million, and in eight hundred millions of instances: and then all the revolting scenes now described, and thousands of similar effects, of which we cannot at present form a distinct conception, would inevitably take place. And, therefore, every man who, from levity and thoughtlessness, or from a disregard to the laws of heaven, persists in the occasional

<sup>\*</sup> Principles of Moral and Political Philosophy, Book III. Part III. chap. 2.

indulgence of such unhalloved gratifications, indulges in a practice which, were it universally to prevail, would sap the foundations of all moral order, exterminate the most endearing relations of society, prostrate man below the level of the brute, open the flood-gates of all iniquity, diffuse misery over the whole mass of human beings, and, at length, empty the world of its inhabitants.

The precept which we have now been considering, is one which, in all probability, is confined, in its references, to the inhabitants of our globe. At any rate, it would be quite nugatory, and therefore can have no place, in the moral code of a world where the distinction of sexes does not exist. And even in those worlds where a similar distinction may exist, the very different circumstances in which their inhabitants are placed, may render the promulgation of such a law altogether unnecessary. It appears to be a temporary regulation, to remain in force only during the limited period of the present economy of Providence; for, in the future destination of the righteous, we are told, that "they neither marry nor are given in marriage, but are as the angels of God in heaven." And, therefore, it is probable, that the recognition of such a law will not be necessary, in the intercourse which take place among redeemed men in the eternal world; but the principle on which it is founded, and from which it flows, will run through all the other new relations and circumstances in which they may be placed. In the existing circumstances of mankind, however, the operation of this law is essentially necessary to the stability and the happiness of the moral world; and, were its requisitions universally observed, the melancholy scenes to which I have alluded would no longer exist; the present and everlasting ruin of thousands, and of millions, would be prevented; and a scene of happiness and love, such as the world has never yet witnessed, would be displayed among all the families of the earth.

#### THE EIGHTH COMMANDMENT.

*"Thou shalt not steal."*

When the Creator had arranged our globe in the form in which we now behold it, he furnished it with every thing requisite for the sustenance and accommodation of living beings, and bestowed the whole of its riches and decorations as a free grant to the sons of men. To man he said, "Behold, I have given you every herb bearing seed, which is upon the face of all the earth, and every tree in the which is the fruit of a tree yielding seed; to you it shall be for meat." Ever since the period when this grant was made, God has not left himself without a witness to his benignity, in that he has unceasingly bestowed on mankind "rain from heaven, and fruitful seasons, filling their hearts with food and

gladness." The earth has, in every age, brought forth abundance to supply the wants of all the living beings it contains; and there is still ample room on its surface, for the accommodation and support of thousands of millions of the human race, in addition to those which now exist. But mankind have never yet agreed about the division and allotment of this free and ample gift of the Creator; for every one is disposed to think that his share in it is too small, and is continually attempting to make inroads upon the allotment of his neighbours. And to this disposition is to be ascribed more than one half of all the evils which have afflicted the world in every age since the fall of man. To counteract such a propensity in mankind, and to regulate their dispositions and conduct in relation to property, is the great object of this command, "Thou shalt not steal."

*To steal*, is to take the property of others, without their knowledge or consent, and to apply it to our own use. The most flagrant and violent breaches of the law, consist in robbery, housebreaking, pilfering, plunder, and pillage. But it may be violated in a thousand different ways of which human laws seldom take any cognizance. It is violated by every species of fraud by which our neighbour may be injured in his wealth or property. It is violated in the ordinary commerce of mankind, by the use of false weights and measures; by selling deteriorated commodities as if they were sound and good; by depreciating the value of what we wish to buy, and concealing the defects of what we wish to sell; by contracting debts which we have no prospect of discharging, and neglecting to pay them when they are due; by breaches of trust, in the case of servants, guardians, executors, or public officers, embezzling and squandering away the substance of others, or applying it to their own use.—It is also violated by trespassing on the property of others, so as to injure fences, gardens, orchards, plantations or corn-fields; and by that disposition to vulgar mischief which delights in breaking lamps, windows, and fences; in injuring and defacing public buildings, walks, and ornamental improvements; in hacking and carving walls, wainscottings, doors, and balustrades; and in cutting down trees and shrubs planted for use or for ornament.—It is violated when we retain borrowed articles beyond a reasonable time, when we suffer them to be injured through negligence, when we circulate them from one person to another, without the knowledge or consent of the proprietors, and when we apply them to purposes for which they were never intended, and which the lender never contemplated.—In short, this law is violated by every species of idleness, pride, vanity, gaming, and prodigality, which has a tendency to injure the external prosperity, either of our own family, or of the families of others.

Were the law which forbids those actions to be entirely set aside, or universally violated, it is easy to foresee, that, in a very short time, the whole assemblage of human beings would be transformed into a set of lawless banditti. Peace, harmony, and good neighbourhood, would be unknown among men; the strong would plunder the possessions of the weak, and deprive them of every enjoyment; children would rob their parents, and parents their children; brothers would plunder brothers, and servants their masters; buying and selling would cease, and all regular trade and commerce would be destroyed: every man's covetous eye would be directed to the wealth and property of his neighbour, with a view of depriving him of his enjoyments; and a thousand schemes, either of treachery or of open violence, would be contrived to effectuate his purpose. Murders would be daily contrived and perpetrated, for the purpose of more easily obtaining possession of the wealth and estates of the powerful and the opulent; and every man's life and happiness would be at the mercy of his covetous neighbour. The inhabitants of one province would rise up against those of another, and, by force of arms, plunder them of all their earthly treasures. One nation would invade the territories of another, for the purpose of ravaging its cities and provinces, and of appropriating its wealth and riches; and, in the midst of such lawless depredations, towns would be demolished, villages consumed to ashes, the fruits of the earth destroyed, men, women, and children, trampled under foot, and crushed to death, and every city and fertile field would present a scene of carnage and desolation. In such a state of society, no man could have confidence in his brother; fear would be on every side; uncertainty would attend every pursuit and possession; of the wealth which any one had acquired, and of the enjoyments which he possessed to-day, he might be deprived before to-morrow; and if, by means of circumspection and vigilance, and the strong arm of power, he were enabled to maintain possession of his property for one year, he could have no rational ground to expect, that he would enjoy it in security for another. And, as no one would think of engaging in regular labour, while he could subsist in plundering his weaker neighbours—the earth would soon be left uncultivated, the useful arts would be abandoned, agricultural industry and improvement would cease, and a universal famine would overspread every land, which would thin the human race, and gradually exterminate them from the face of the earth.

Such scenes of plunder and depredation, have in fact been partially realized in every age and nation of the world, and are still realized, to a certain extent, even in nations which boast of their progress in religion, in civilization, and in science. The annals of the human race contain little more than a number of melancholy records

of wholesale robbery, committed by one tribe of human beings upon another. One public robber and desperado has arisen after another, in constant succession, and, at the head of numerous armies, has violated the territories of peaceful industry, demolished the habitations of their unoffending inhabitants, broken down their furniture, and consigned it to the flames; wasted and devoured the fruits of their ground, and plundered them of every thing which could render existence desirable. And the inferior ranks of mankind, stimulated by the same principles which actuate their superiors, have supported a system of speculation, of cheating, of litigation, of injustice, and oppression, which, were it left solely to its own native energies, would soon undermine the foundations of the moral world. That such principles and practices have never yet become universal in their operation, is not owing so much to any deficiency in their malignant tendency, as to the over-ruling providence of the Moral Governor of the world, who has, by his influence, and his physical arrangements, confined the lawless passions of men within certain bounds, beyond which they cannot pass.

Were a principle of honesty and of justice, in regard to property, to pervade the mind of every human being; or, in other words, were the law to which I am now adverting universally recognised, a new scene would open upon the moral world, altogether different from what has hitherto been displayed in the transactions of mankind. The iron rod of oppression would be shivered to atoms, and destroying armies would no longer ravage the habitations of men. The crowds of sharpers, cheats, and jockeys, that now stalk through the world, with unblushing fronts, to entrap the unwary, would forever disappear from the world; and impartial justice would reign triumphant over every department of society. No malignant purpose would ever be formed to injure any one in his wealth and property; and all the harassing law-suits and prosecutions, which now distress so many thousands of families, would be swept away. Every loan of money, books, furniture, or utensils, would be returned without injury, and without unnecessary delay; and every debt punctually discharged, according to the nature of the obligation, and at the period at which it was due: Every bargain would be transacted on the principles of immutable justice, and the conditions of every contract faithfully performed: No suspicions of knavery would ever harbour in the breast, nor the least alarm at the possible consequences of any mercantile transaction. Public buildings would be secure from the inroads of the genius of mischief, and gardens and orchards from every wanton depredation. Locks, and bars, and bolts, would no longer be required for securing our substance from the pilferer and the robber; and the iron gratings of a bridewell or a jail, would never again remind us

of the dishonesty and the depravity of man. Servants would be universally honest and trustworthy, and the property of their masters would be regarded as a sacred deposit.

And what a happy change would such a state of society introduce among mankind! What a host of cares, anxieties, suspicions, vexations, and perplexities, would be chased away! and what a world of conveniences, and of delightful associations, would thus be created! Every merchant, by marking the price and the quality of each commodity, might leave his goods open to the inspection of the public, and enjoy himself in the bosom of his family, or in active services for the good of the community, without the least risk of loss or of depredations; and every purchaser might depend upon procuring the articles he wanted at their just value. Every traveller would prosecute his journey, either by day or by night, without the least apprehension from sharpers or robbers, and without being harassed by the impositions of inn-keepers, coachmen, carriers, and porters. Every one's mind would be at perfect ease, in regard to his property, whether he were at home or abroad, in health or in sickness; being firmly persuaded that every trust would be faithfully discharged, and every commercial concern fairly and honourably transacted. Selfishness and rapacity would give place to a spirit of justice, equity, and benevolence; contentions, jockeyings, and altercations would cease; peace and concord would prevail, and righteousness and truth would shed their benign influence over the whole brotherhood of mankind.

#### THE FIFTH COMMANDMENT.

*"Thou shalt not bear false witness against thy neighbour."*

This command, like most of the others, is expressed in a negative form. It is directed against every species of falsehood, and, consequently, must be viewed as inculcating a sacred and universal adherence to truth, in all our thoughts, words, and actions. In the remarks I may throw out in relation to this precept, I shall consider it chiefly in its positive form, as commanding an unviolable attachment to truth. Truth may be considered in two different points of view—*logical truth*, which consists in *the conformity of a proposition or assertion with the actual state of things*; and *moral truth*, which consists in *the agreement of our words and actions with our thoughts*. Logical truth belongs to the *thing* or the fact asserted; moral truth, or what is termed *veracity*, has a reference to the *person* who utters it. In both these respects, truth is of immense importance to all intelligent beings.—The importance of truth and veracity will appear from the following considerations.

In the first place, it is the bond of society, and the foundation of all that confidence and in-

tercourse which subsist among rational beings. By far the greater part of all the knowledge we possess, has been derived from the testimony of others. It is from the communication of others, and from a reliance on their veracity, that those who were never beyond the limits of Great Britain, know that there are such cities as Paris, Vienna, Constantinople, and Cairo; and that there are such countries as Canada, Nova Scotia, Brazil, Peru, Persia, China, and Hindostan. It is from the same source that we have learned the facts of ancient and modern history, and that there once existed such empires as the Greek and Roman, the Persian, Assyrian, and Babylonian. On the same ground, the veracity of others, we confide in all the domestic relations and intercourses of life; and on this ground all the transactions of commercial society, and all the arrangements and operations of government are conducted. On the implied veracity of others, we retire from our employments at certain hours, and sit down to breakfast or dinner; and, on the first day of the week, we assemble in a certain place, at an appointed hour, for religious worship. On this ground, the pupil confides in his teacher, for instruction—the child in his parents, for sustenance, clothing and protection, the master in his servant, for the execution of his orders, and the wife in her husband for provision and support. We confide every moment in the *faithfulness* of the Almighty for the regular returns of day and night, of summer and winter, of seed-time and harvest. Could the veracity of God be impeached or rendered liable to suspicion, we should remain in awful suspense, whether another day would again dawn upon the world, or whether the earth would be shattered to pieces, and its fragments dispersed throughout surrounding worlds, before the sun again appeared in the horizon. A Being possessed of boundless knowledge and omnipotence, without veracity, would be the terror of the whole intelligent universe, and would fill them with universal agitation and alarm.

Again, truth is the foundation of our present comfort and of our future prospects. On the veracity of those illustrious characters that have gone before us, whose declarations were confirmed by signs and miracles, we depend for the hope of forgiveness and acceptance with God. and for those rich sources of consolation which are calculated to support the mind under the afflictions of mortality, and to cheer and animate us in the prospect of a future world. Our hopes of happiness beyond the grave, of the resurrection of our bodies at the termination of the present plan of providence—of the renovation of the physical system of our globe—of a complete re-creation to holiness and virtue—of a re-union with departed friends—of associating with virtuous beings of a superior order—of mingling in a happier world with all those illustrious saints

who have gone before us—of contemplating the manifestations of Deity on a more extensive scale ; and of enjoying unmixed felicity without interruption and without end ; depend upon the testimony of the inspired writers, and the light in which we view the truths or declarations which they have recorded. And, therefore, the man who endeavours to undermine the authority of the sacred records, or to distort or misrepresent their meaning by sophistical reasonings, ought to be viewed as a deceiver, and as an enemy to his species, who wishes to deprive his fellow-men of their most substantial enjoyments, and of their most cheering prospects.

Again, truth and veracity are of the utmost importance in relation to the views we ought to take of the character of God. The moral character of the Deity is delineated in the Scriptures, and we are enabled to contemplate this character, in its true light, in so far as we understand and appreciate the delineations of the sacred writers. But his character is also exhibited in the works of creation and providence. Every physical law of nature, every arrangement in the material system, every movement which exists in the boundless universe ; every apparent deviation from the general course of nature, as in the case of earthquakes and volcanoes ; every event in the history of nations, every fact in relation to the physical and moral condition of the different tribes of the human race, and every arrangement in reference to the lower ranks of animated beings—embodies in it an exhibition of certain aspects of the divine character ; and these aspects, if fairly represented, ought to harmonize with the delineations contained in the sacred records. To ascertain such facts as those to which I now allude, requires, in many instances, the exercise of profound reasoning, and of accurate investigation, and that the mind should be free from the influence of prejudice and of every improper bias, and that the facts, when ascertained, be fairly represented, and accurately recorded ; otherwise, nothing but a distorted view of the divine character will be exhibited to the mind. For example, if the earth be represented as among the largest bodies in nature, and as placed at rest in the centre of the universe, and that the sun, moon, and all the other celestial orbs revolve around it every day, and consequently, that the planetary bodies move in orbits which display inextricable confusion—such a representation is not a true exhibition of the God of heaven, but a phantom of our own imagination ; and, if carried out to all its legitimate consequences, would involve an impeachment of the wisdom and intelligence of the Deity, and of the sublime simplicity and order, which characterize his operations in the universe. If the planet Saturn be represented as a globe 900 times larger than the earth, and surrounded with a ring 600,000 miles in circumference, it conveys

a very different idea of the majesty of the divine Being who formed it, from what we are led to entertain, when we consider it as only a taper, or a brilliant stud, fixed in the vault of heaven. If the eye of a fly be exhibited as containing ten thousand polished transparent globes, nicely adjusted for the purpose of vision, it displays the character of its Maker in a different light from that in which we might be disposed to view it, when this animal is represented as a nuisance in creation, and designed only to be mangled and tortured by a cruel and unthinking schoolboy.

In some instances the inaccurate statement of a physical fact, or the false colouring put upon it, may have a tendency to endanger the eternal interests of mankind. Mr. Brydone, in his "Tour through Sicily," states, on the authority of a priest, named Recupero, that, in sinking a pit near Jaci, in the neighbourhood of Mount *Ætna* "they pierced through seven distinct lavas, one under the other, the surfaces of which were parallel, and most of them covered with a bed of thick earth." From suppositions founded on questionable data, he concluded, that "it requires 2000 years or upwards to form but a scanty soil on the surface of a lava," and, consequently, that "the eruption which formed the lowest of these lavas, must have flowed from the mountain at least 14000 years ago. This pretended fact was, for a while, triumphantly exhibited by sceptics, as an unanswerable argument against the truth of the Mosaic history ; and its publication has, no doubt, tended to stagger weak minds, and to confirm the infidel in his prejudices against the truth of Revelation. But it has been shown by eminent geologists, that the facts alluded to are grossly mis-stated, and that no vegetable mould exists between these beds of lava ; and, consequently, the argument founded upon them goes for nothing. Mr. Brydone himself, in the very same volume in which these pretended facts are stated, before he had advanced twenty pages farther in his account of the regions about Mount *Ætna*, states a fact which completely overturns all his preceding reasonings and calculations. In describing the country near Hybla, as having been "overwhelmed by the lava of *Ætna*, and having then become totally barren," he adds, "in a second eruption, by a shower of ashes from the mountain, it soon resumed its ancient beauty and fertility." So that it is here admitted, that, instead of requiring a period of 2000 years, a bed of lava may speedily be transformed into a beautiful and fertile region. But even although such facts were fairly represented,—yea, although Mr. Brydone and the Canon Recupero could have proved, to a demonstration, that the strata of the earth is not only fourteen thousand, but fourteen hundred thousand years old, it would not in the least invalidate a single assertion contained in the Mosaic history ; for Moses de-

a *ribes* only the *arrangement* of the earth into its present form, but no where asserts, that the *materials* of which our globe is composed were *created*, or brought out of nothing, at the period at which his history commences. The circumstance, however, to which I have now adverted, shows us of how much importance it is, in many cases, that even a physical fact be fairly stated, as well as the moral facts and the doctrines contained in the Scriptures. For, since every fact in the economy of nature, and in the history of providence, exhibits a certain portion of the divine character, a very different view of this character will be exhibited, according to the different lights in which we view the divine operations. And therefore, every one who wilfully misrepresents a physical fact or law of nature, is a deceiver, who endeavours to exhibit a distorted view of the character of the Deity. It is nothing less than a man "bearing false witness" against his Maker.

Again, veracity is of infinite importance in reference to our future improvement in the eternal world. In that world, we have every reason to believe our knowledge of the attributes of God will be enlarged, and our views of the range of his operations in creation and providence extended far beyond the limits to which they are now confined. But the Divine Being himself, from the immateriality and immensity of his nature, will remain forever invisible to all finite intelligences; and hence he is described by the Apostle, as "the King Eternal, Immortal, and Invisible, whom no man hath seen or can see." It is, therefore, not only probable, but absolutely certain, that a great portion, perhaps the greatest portion of our knowledge in that state, will be derived from the communications of other intelligences. With intellectual beings of a higher order we shall hold the most intimate converse; for we are informed, that "just men made perfect" will join "the innumerable company of angels." These beings are endued with capacious powers of intellect, and have long been exercising them on the most exalted objects. As messengers from the King of heaven to the inhabitants of the earth, they have frequently winged their way through the celestial regions, and surveyed many of those glorious systems which lie hid from the view of mortals. We have every reason to believe, that they have acquired expansive views of the dispensations of the Almighty, not only in relation to man, but in relation to numerous worlds and intelligences in different provinces of the empire of God. And, therefore, they must be admirably qualified to impart ample stores of information on the sublimest subjects, to the redeemed inhabitants from our world. From the communications of these intelligences we may derive information of the order and arrangements of other systems; of the natural scenery of other worlds; of the different

orders of intellectual beings who people them; of the means by which they are carried forward in moral and intellectual improvement; of the most remarkable events which have happened in the course of their history; of the peculiar displays of divine glory that may be made to them, and of the various changes through which they may have passed in the course of the divine dispensations.

But the utility of all such sublime communications, and the delightful transports with which they will be accompanied, will entirely depend upon the immutable veracity of these moral intelligences who shall be employed in conveying information respecting the divine plans and operations. No *fictional* scenes and narrations will be invented, as in our degenerate world, to astonish a gaping crowd; nothing but unvarnished truth will be displayed in that world of light; and the *real* scenes which will be displayed, will infinitely transcend, in beauty, in grandeur, and in interest, all that the most fertile imagination can conceive. Were a single falsehood to be told in heaven, were the tongue of an archangel to misrepresent a single fact in the divine economy, or were the least suspicion to exist that truth might be violated in such communications, the mutual confidence of celestial intelligences would instantly be shaken; and, from that moment, their intercourse and their happiness would be destroyed. Hence, we are repeatedly told, in the book of Revelation, that, "Whosoever loveth, or maketh a lie, shall in no wise enter within the gates of the new Jerusalem." And, therefore, every one who expects to be an inhabitant of that happy world, ought now to cultivate a strict regard to truth and veracity in all its researches, intercourses, and communications; otherwise he cannot be admitted, from the very constitution of things, to the society of saints and angels in the realms of bliss.

Thus it appears, that truth is of the utmost importance to all rational beings, as it forms the source of our knowledge, the foundation of all social intercourse, the ground of our present comfort and future prospects, the basis of all the views we can take of the Divine character and operations, and of all our prospects of future improvement in the eternal world. It is the bond of union among all the inhabitants of heaven; it is the chain which connects the whole moral universe; and it constitutes the immutable basis on which rests the throne of the Eternal.

In the depraved society of our world, truth is violated in ten thousand different ways. It is violated in thoughts, in words, in conversation, in oral discourses, in writings, in printed books, by gestures and by signs, by speaking, and by remaining silent. It is violated in reference to the *character of our neighbour*, when we invent tales of falsehood respecting him; when we listen with pleasure to such tales when told by

others ; when we sit mute, and refuse to vindicate his character when it is unjustly aspersed ; when we endeavour to aggravate the circumstances which may have accompanied any criminal action ; when we make no allowances for the force of temptation, and the peculiar circumstances in which the criminal may have been placed ; when we fix upon an insulated act of vice or folly, and apply it to our neighbour as a general character ; when we rake up, with a malevolent design, an action which he has long since reprobated and repented of ; when his character is made the subject of jest or merriment, and when, by smiles, and noddings, and gestures, we insinuate any thing injurious to his reputation. It is violated in *promises*—when we promise, either what we have no intention of performing, or what we had no right to promise, or what is out of our power to perform, or what would be unlawful for us to execute. It is violated in *threatenings*, when we neglect to put them in execution, or we threaten to inflict what would be either cruel or unjust. It is violated in *history*, when the principal facts are blended with doubtful or fictitious circumstances ; when the conduct of liars and intriguers, of public robbers and murderers, is varnished over with the false glare of heroism and of glory ; and when the actions of upright men are, without sufficient evidence, attributed to knavery, or to the influence of fanaticism ; when the writer construes actions and events, and attributes to the actors motives and designs, in accordance with his own prejudices and passions, and interweaves his opinions and deductions, as if they were a portion of the authenticated records of historical fact.—It is violated in the invention of *fictitious* narratives, and in the relation of marvellous stories, when the system of nature is distorted, historical facts caricatured, misrepresented, and blended with the vagaries of a romantic imagination ; when scenes, events, and circumstances, “ which never did nor can take place,” are presented to the view, merely to convey a transient gratification to trifling and indolent minds.

It is violated by *men of science* when they give an inaccurate statement of the results of their observations and experiments ; when, either through carelessness or design, they give an unfair representation of the facts and principles in nature, in order to support a favourite system or hypothesis ; and when they studiously keep out of view the various circumstances in which every fact should be contemplated.—It is violated in the *literary world*, when the editor of a magazine or a review writes an article, and addresses it to himself, as if it came from the pen of another ; when, for the sake of “ filthy lucre,” or to gratify a friend, he bestows encomiums on a work which is unworthy of the attention of the public ; or when, to gratify a mean, or revengeful passion, he misrepresents or abuses the literary productions of his

opponents ; or when an author writes a review of his own work, and imposes it on the public, as if it were the decision of an impartial critic.—It is violated by *controversialists*, when they bring forward arguments in support of any position which they are conscious are either weak or unsound ; when they appear more anxious to display their skill and dexterity, and to obtain a victory over their adversaries, than to vindicate the cause of truth ; when sneers, and sarcasms, and personal reproaches, are substituted in the room of substantial arguments ; when they misrepresent the sentiments of their opponents, by stating them in terms which materially alter their meaning ; and when they palm upon them the doctrines and opinions which they entirely disavow.

It is violated in *commercial transactions*, when deteriorated goods are varnished over with a fair outside, and puffed off as if they were saleable and sound ; when a merchant asks more than he is willing to take for any commodity ; when he depreciates the commodities of his neighbour ; when he undervalues whatever he is purchasing, and makes an overcharge for the articles of which he is disposing ; when he denies the goods he has in his possession, when there is the prospect of an advancing price,—and in a thousand other ways, best known to the nefarious trader.—It is violated by persons in every department of life, not only when they utter what they know to be false, but when they profess to declare the whole truth, and keep back part of it with an intention to deceive ; when they make use of a proposition that is literally true, in order to convey a falsehood ;\* when they flatter the vanity of weak minds ; when they ascribe to their friends or to others good qualities which do not belong to them, or refuse to acknowledge those accomplishments of which they are possessed ; when they endeavour to cajole children into obedience, by promising what they never intend to perform, and threatening what they never intend to inflict ; and when they indulge in a habit of exaggeration, in the account they give of their adventures, and of the things which they have seen or heard.

Truth is violated by *signs*, as well as by words,—as, when we point with our finger in a wrong direction, when a traveller is inquiring about the road he should take ; when a British ship hoists

\* The following fact will illustrate this and similar pieces of falsehood:—A person, when selling a watch, was asked by the purchaser if it kept time correctly ? He was told by the owner, that neither the hour nor the minute hand had required to be altered for more than a twelve-month. This was *literally* true ; but the watch was, nevertheless, a very bad regulator of time. When hung in a perpendicular position, it went too slow, and, when laid in a horizontal position, it went too fast ; but by alternately shifting these positions, and thus modifying the rates of motion, the hands did not require to be altered. Such assertions, however, are to be considered as direct lies, when they are intended to convey a false or erroneous conception, as in the instance now stated.

Spanish colours; when flags of truce are violated; when spies insinuate themselves into society as upright men, for the purpose of entrapping the unwary; when false intelligence is communicated to an enemy; when fires are lighted, or put out, in order to deceive mariners at sea; and when signals of distress are counterfeited by ships at sea, for the purpose of decoying into their power the ships of an enemy.

Truth is violated in relation to God, when we conceal from those whom we are bound to instruct, the grandeur and immensity of his works, and the displays of divine intelligence and skill which are exhibited in his visible operations; when we exhibit a diminutive view of the extent and glory of his kingdom; when we give an inaccurate and distorted representation of the laws of nature, and of the order and the economy of the universe; when we misrepresent the facts which exist in the system of nature, and which occur in the truth of providence; when we call in question the history of that revelation which he has confirmed by signs and miracles, and by the accomplishment of numerous predictions; when we misrepresent its facts, its doctrines, and its moral requisitions; when we transform its historical narrations into a series of parables and allegories; when we distort its literal meaning by vague and injudicious spiritualising comments; when we fix our attention solely on its doctrines, and neglect to investigate its moral precepts; and when we confine our views to a few points in the system of revelation, and neglect to contemplate its whole range, in all its aspects and bearings.

In the above, and in ten thousand other modes, is the law of truth violated by the degenerate inhabitants of our world. The mischiefs and the miseries which have followed its violation, in reference to the affairs of nations, to the private interests of societies, families, and individuals, and to the everlasting concerns of mankind, are incalculable, and dreadful beyond description. It is one of the principal sources from which have sprung the numerous abominations and cruelties connected with the system of Pagan idolatry, the delusions and the persecuting spirit of the votaries of Mahomet, and the pretended miracles, and "the lying wonders," of that church which is denominated "the mother of harlots and abominations of the earth." It has been chiefly owing to the violation of this law, that the thrones of tyrants have been supported, that liberty has been destroyed, that public safety and happiness have been endangered, that empires have been overturned, that nations have been dashed one against another, and that war has produced among the human race so many overwhelming desolations. By the pernicious influence of falsehood, the peace of families has been invaded, their comforts blasted, their good name dishonoured, their wealth destroyed, their hopes disappointed, and their

bright prospects of happiness involved in a cloud of darkness and despair. By the sophistry of unprincipled men, literature and science have been perverted, and the avenues to substantial knowledge rendered difficult and dangerous; litigations have been multiplied without number; human beings have been agitated, perplexed, and bewildered; and the widow and the fatherless oppressed and robbed of their dearest enjoyments. Could we search the private records of ancient kings, princes, and legislators, and trace the deceitful plans which have been laid in palaces and cabinets—or could we, at this moment, penetrate into all the intrigues, deceptions, treacheries, plots, and machinations, which are going forward in the cabinets of despots, the mansions of princes, and the courts of law, throughout Europe, Africa, and Asia; such a host of falsehoods and "lying abominations," like an army of spectres from the infernal regions, would stare us in the face, as would make us shrink back with horror and amazement, and fill us with astonishment that the patience of the God of heaven has been so long exercised towards the inhabitants of such a depraved and polluted world.

Let us now consider, for a little, some of the effects which would inevitably follow were the law of truth universally violated. In this case a scene of horror and confusion would ensue, of which it is difficult for the mind to form any distinct conception. It is obvious, in the first place, that rational beings could never improve in knowledge, beyond the range of the sensitive objects that happened to be placed within the sphere of their personal observation. For, by far the greater part of our knowledge is derived from the communications of others, and from the stimulus to intellectual exertion which such communications produce.—Let us suppose a human being trained up, from infancy, in a wilderness, by a bear or a wolf, as history records to have been the case of several individuals in the forests of France, Germany, and Lithuania,—what knowledge could such a being acquire beyond that of a brute? He might distinguish a horse from a cow, and a man from a dog, and know that such objects as trees, shrubs, grass, flowers, and water, existed around him; but knowledge, strictly so called, and the proper exercise of his rational faculties, he could not acquire, so long as he remained detached from other rational beings. Such would be our situation, were falsehood universal among men. We could acquire a knowledge of nothing but what was obvious to our senses in the objects with which we were surrounded. We could not know whether the earth were twenty miles, or twenty thousand miles in extent, and whether oceans, seas, rivers, and ranges of mountains, existed on its surface, unless we had made the tour of it in person, and, with our own eyes, surveyed the various objects it contains. Of course, we should remain in ab

solate ignorance of the existence and the attributes of God, of the moral relations of intelligent beings to their Creator, and to one another, and of the realities of a future state. For it is only, or chiefly, through the medium of testimony, combined with the evidence of our senses, that we acquire a knowledge of such truths and objects.

In the next place, all confidence among intelligent beings, would be completely destroyed. Disappointment would invariably attend every purpose and resolution, and every scheme we wished to execute, if it depended in the least degree upon the direction or assistance of others. We durst not taste an article of food which we received from another, lest it should contain poison; nor could we ever construct a house to shelter us from the storm, unless our own physical powers were adequate to the work. Were we living in Edinburgh, we could never go to Musselburgh or Dalkeith, if we were previously ignorant of the situation of these places; or were we residing in London, it would be impossible for us ever to find our way to Hammersmith or Hampstead, unless, after a thousand attempts, chance should happen to direct us; and when we arrived at either of these villages, we should still be in as much uncertainty as ever whether it was the place to which we intended to direct our steps. Confidence being destroyed, there could be no friendship, no union of hearts, no affectionate intercourse, no social converse, no consolation or comfort in the hour of distress, no hopes of deliverance in the midst of danger, and no prospect of the least enjoyment from any being around us. In such a case, the mind would feel itself as in a wilderness, even when surrounded by fellow intelligences, and wherever it roamed over the vast expanse of nature, or among the mass of living beings around it, it would meet with no affectionate interchange of feelings and sentiments, and no object on which it could rest for solace and enjoyment. Every one would feel as if he were placed in the midst of an infinite void, and as if he were the only being residing in the universe. In such a case we would flee from the society of men as we would do from a lion or a tiger when rushing on his prey; and hide ourselves in dens, and forests, and caverns of the earth, till death should put a period to a cheerless and miserable existence.

All social intercourses and relations would cease;—families could not possibly exist; nor any affectionate intercourse between the sexes; for truth, and the confidence which is founded upon it, are implied in all the intercourses of husbands and wives, of brothers and sisters, and of parents and children;—and consequently, the human race, dropping into the grave, one after another, like the leaves of autumn, without any successors, would, in a short time, be extirpated from the earth. In such a state, kindness and affection would never be exercised; trade

and commerce, buying and selling, social compacts and agreements would be annihilated; science, literature, and the arts, could not exist; and consequently, universities, colleges, churches, academies, schools, and every other seminary of instruction would be unknown. No villages, towns, nor cities would be built; no fields cultivated; no orchards, vineyards, nor gardens planted; no intercourse would exist between different regions of the globe; and nothing but one dreary barren waste would be presented to the eye, throughout the whole expanse of nature. So that were truth completely banished from the earth, it would present a picture of that dark and dismal region where "all liars have their portion!" where all are deceivers and deceived, and where the hopeless mind roams amidst innumerable false intelligences, for one ray of comfort, or one confidential spirit in which it may confide, but roams in vain.

In short, were truth banished not only from this world, but from the universe at large, creation would be transformed into a chaos; the bond which now connects angels and archangels, cherubim and seraphim, in one harmonious union, would be forever dissolved; the inhabitants of all worlds would be thrown into a state of universal anarchy, they would shun each other's society, and remain as so many cheerless and insulated wretches, amidst the gloom and desolations of universal nature; all improvements in knowledge, and all progressive advances towards moral perfection, would be forever interrupted; and happiness would be banished from the whole intelligent system. Every mind would become the seat of terror and suspense, and would be haunted with frightful spectres and dreadful expectations. The government of the Eternal would be subverted, the moral order of the intelligent system overturned; all subordination would cease, and misery would reign uncontrolled throughout every region of intellectual existence. For truth is implied in the principle of love; it is essential to its existence; so that the one cannot operate except on the basis of the other: and we have already shown, that the destruction of love would be the destruction of all order, and of all happiness among intelligent beings.

Such are some of the dreadful effects which would inevitably follow, were the law under consideration reversed or universally violated. In our world this law has, hitherto, been only partially violated; yet what dreadful mischiefs, beyond calculation, and even beyond conception, has its frequent violation created! Ever since that moment when "the father of lies" deceived the first human pair, how many thousands of millions of liars have trodden in his footsteps! and what a host of falsehoods has followed in their train, which have destroyed the harmony of the moral system, and robbed the world of happiness and repose! Yet how little are we affect-

ed by the frequent violations of this law? and how seldom do we reflect, that every falsehood we unadvisedly utter, is an infringement of that law on which rest the throne of the Almighty and the eternal happiness of the universe? For if one lie may be palliated or vindicated, on the same principle we might vindicate a thousand, and a million, and millions of millions, till falsehood became universal among all ranks of beings and till the moral order of the intelligent creation was completely subverted. Of how much importance is it then, that an inviolable attachment to truth, in its minutest ramifications, be early impressed upon the minds of the young, by persuasion, by precept, by example, by reasoning, and by a vivid representation of its importance, and of its inestimable benefits? and how careful should we be to preserve them from all incentives to the practice of lying, and especially from the company of those "whose mouth speaketh vanity, and their right hand is a right hand of falsehood."

Were falsehood universally detested, and the love of truth universally cherished; were a single lie never more to be uttered by any inhabitant of this globe, what a mighty change would be effected in the condition of mankind, and what a glorious radiance would be diffused over all the movements of the intelligent system? The whole host of liars, perjurers, sharpers, seducers, slanderers, tale-bearers, quacks, thieves, swindlers, harpies, fraudulent dealers, false friends, flatterers, corrupt judges, despots, sophists, hypocrites, and religious impostors, with the countless multitude of frauds, treacheries, impositions, falsehoods, and distresses which have followed in their train, would instantly disappear from among men. The beams of truth, penetrating through the mists of ignorance, error, and perplexity, produced by sophists, sceptics, and deceivers, which have so long enveloped the human mind, would diffuse a lustre and a cheerfulness on the face of the moral world, like the mild radiance of the morning after a dark and tempestuous night. Confidence would be restored throughout every department of social life; jealousy, suspicion, and distrust would no longer rankle in the human breast; and unfeigned affection, fidelity, and friendship, would unite the whole brotherhood of mankind. With what a beautiful simplicity, and with what smoothness and harmony would the world of trade move onward in all its transactions! How many cares and anxieties would vanish! how many perplexities would cease! and how many ruinous litigations would be prevented? For the violation of truth may be considered as the chief cause of all those disputes respecting property, which have plunged so many families into suspense and wretchedness. The tribunals of justice would be purified from every species of sophistry and deceit; and the promises of kings, and the leagues of nations,

would be held sacred and inviolate. Science would rapidly advance towards perfection; for, as all its principles and doctrines are founded upon facts, when truth is universally held inviolable, the facts on which it is built will always be fairly represented. Every fact asserted by voyagers and travellers, in relation to the physical or the moral world, and every detail of experiments made by the chemist and the philosopher, would form a sure ground-work for the development of truth, and the detection of error; without the least suspicion arising in the mind respecting the veracity of the persons on whose testimony we rely. For want of this confidence the mind has been perplexed and distracted by the jarring statements of travellers, naturalists, and historians; false theories have been framed; systems have been reared on the baseless fabric of a vision; the foundations of science have been shaken; its utility called in question, and its most sublime discoveries overlooked and disregarded.

In fine, the clouds which now obscure many of the sublime objects of religion, and the realities of a future world, would be dispelled, were falsehood unknown, and truth beheld in its native light; and religion, purified from every mixture of error and delusion, would appear arrayed in its own heavenly radiance, and attract the love and the admiration of men. When exhibited in its native grandeur and simplicity, all doubts respecting its divine origin would soon vanish from the mind—the beauty and sublimity of its doctrines would be recognised as worthy of its Author; and all its moral requisitions would be perceived to be "holy, just, and good," and calculated to promote the order, and the everlasting happiness of the intelligent universe. Divine truth irradiating every mind, and accompanied with the emanations of heavenly love, would dispel the gloom which now hangs over many sincere and pious minds; would unite man to man, and man to God; and the inhabitants of this world, freed from every doubt, error, and perplexity, would move forward in harmony and peace, to join "the innumerable company of angels, and the general assembly of the spirits of just men made perfect, whose names are written in heaven."

#### THE TENTH COMMANDMENT.

*"Thou shalt not covet thy neighbour's house, thou shalt not covet thy neighbour's wife, nor his man-servant, nor his maid-servant, nor his ox, nor his ass, nor any thing that is thy neighbour's."*

Every precept of the law to which I have hitherto adverted, has a reference not only to the *external conduct* of moral agents, but also to the *internal motives or principles* from which that conduct proceeds. This is evident from the con-

considerations already stated, and from the whole tenor of Divine Revelation ;—and it is in unison with reason, and with the common sense of mankind, that the merit or demerit of any action is to be estimated, according to the intention of the actor, and the disposition from which it flows. That no doubt may remain on this point, the Supreme Legislator closes the decalogue with a command, which has a reference solely to the desires and dispositions of the mind : “Thou shalt not covet.” Covetousness consists in an *inordinate* desire of earthly objects and enjoyments. This desire, when uniformly indulged, leads to a breach of almost every other precept of the Divine law ; and is the source of more than one half of all the evils which afflict the human race. It leads to a breach of the eighth command, by exciting either to fraudulent dealings, or to direct acts of theft and robbery.—It leads to a breach of the ninth command, by cherishing the principle of falsehood which is implied in every fraudulent transaction.—It leads to a violation of the sixth command, by engendering a spirit of revenge against those who stand in the way of its gratification ; and by exciting the covetous man to the commission of murder, in order to accomplish his avaricious desires.—It also leads to a violation of the seventh command ; for, when one “covets his neighbour’s wife,” the next step is to endeavour to withdraw her affection from her husband, and to plunge a family into misery and distress.—It also leads to a violation of the fifth precept of the law, not only as it steals the heart against those kindly filial affections which children ought to exercise towards their parents, but as it excites them to withhold from their parents, when in old age and distress, those external comforts which are requisite to their happiness, and which it is the duty of affectionate children to provide. And, when covetousness has thus led to the breach of every other precept of the second table of the law, it follows, that all the precepts of the first table are also virtually violated. For all the commandments of the first table are briefly summed up in this comprehensive precept, “Thou shalt love the Lord thy God with all thy heart :” but it is obviously impossible, nay, it would be a contradiction in terms, to suppose, that supreme love to the Creator can reside in the same breast in which an *inordinate* desire of worldly enjoyments reigns uncontrolled, and in which love to man has no existence. So that covetousness may be considered as the great barrier which separates between man and his Maker, and also as the polluted fountain from whence flow all the moral abominations and the miseries of mankind.

The more obvious and direct manifestation of this principle is generally distinguished by the name of *Avarice*, or an *inordinate* desire of riches. And what a countless host of evils has flowed from this unhallowed passion, both in relation to individuals, to families, to nations, and to the

world at large ! In relation to the avaricious man himself, could we trace all the eager desires, anxieties, perplexities, and cares, which harass his soul ; the fraudulent schemes he is obliged to contrive, in order to accomplish his object ; the miserable shifts to which he is reduced, in order to keep up the appearance of common honesty ; the mass of contradictions, and the medley of falsehoods, to which he is always obliged to have recourse ; the numerous disappointments to which his eager pursuit of wealth continually exposes him, and by which his soul is pierced as with so many daggers—we should behold a wretched being, the prey of restless and contending passions, with a mind full of falsehoods, deceitful schemes, and grovelling affections, like a cage-full of every unclean and hateful bird,—a mind incapable of any rational enjoyment in this life, and entirely incapacitated for relishing the nobler enjoyments of the life to come. Such a man is not only miserable himself, but becomes a moral nuisance to the neighbourhood around him ; stinting his own family of its necessary comforts ; oppressing the widow and the fatherless ; grasping with insatiable fangs every house, tenement, and patch of land within his reach ; hurrying poor unfortunate debtors to jail ; setting adrift the poor and needy from their long-accustomed dwellings ; and presenting to the young and thoughtless a picture, which is too frequently copied, of an immortal mind immersed in the mire of the most degrading passions, and worshipping and serving the creature more than the Creator, who is blessed forever.

In relation to large communities and nations, this grovelling passion has produced, on an extensive scale, the most mischievous and destructive effects. It has plundered palaces, churches, seats of learning, and repositories of art ; it has polluted the courts of judicature, and the tribunals of justice ; it has corrupted magistrates, judges, and legislators ; and has transformed many even of the ministers of religion, into courtly sycophants, and hunters after places and pensions. It has ground whole nations to poverty, under the load of taxation ; it has levelled spacious cities with the dust ; turned fruitful fields into a wilderness ; spread misery over whole empires ; drenched the earth with human gore ; and waded through fields of blood in order to satiate its ungovernable desires. What has led to most of the wars which have desolated the earth, in every age, but the insatiable cravings of this restless and grovelling passion ? It was the cursed love of gold that excited the Spaniards to ravage the territories of Mexico and Peru, to violate every principle of justice and humanity, to massacre, and to perpetrate the most horrid cruelties on their unoffending inhabitants. It is the same principle, blended with the lust of power, which still actuates the infatuated rulers of that unhappy nation, in their vain attempts to overthrow the

ed by the frequent violations of this law? and how seldom do we reflect, that every falsehood we unadvisedly utter, is an infringement of that law on which rest the throne of the Almighty and the eternal happiness of the universe? For if one lie may be palliated or vindicated, on the same principle we might vindicate a thousand, and a million, and millions of millions, till falsehood became universal among all ranks of beings and till the moral order of the intelligent creation was completely subverted. Of how much importance is it then, that an inviolable attachment to truth, in its minutest ramifications, be early impressed upon the minds of the young, by persuasion, by precept, by example, by reasoning, and by a vivid representation of its importance, and of its inestimable benefits? and how careful should we be to preserve them from all incentives to the practice of lying, and especially from the company of those "whose mouth speaketh vanity, and their right hand is a right hand of falsehood."

Were falsehood universally detested, and the love of truth universally cherished; were a single lie never more to be uttered by any inhabitant of this globe, what a mighty change would be effected in the condition of mankind, and what a glorious radiance would be diffused over all the movements of the intelligent system? The whole host of liars, perjurers, sharpers, seducers, slanderers, tale-bearers, quacks, thieves, swindlers, harpies, fraudulent dealers, false friends, flatterers, corrupt judges, despots, sophists, hypocrites, and religious impostors, with the countless multitude of frauds, treacheries, impositions, falsehoods, and distresses which have followed in their train, would instantly disappear from among men. The beams of truth, penetrating through the mists of ignorance, error, and perplexity, produced by sophists, sceptics, and deceivers, which have so long enveloped the human mind, would diffuse a lustre and a cheerfulness on the face of the moral world, like the mild radiance of the morning after a dark and tempestuous night. Confidence would be restored throughout every department of social life; jealousy, suspicion, and distrust would no longer rankle in the human breast; and unfeigned affection, fidelity, and friendship, would unite the whole brotherhood of mankind. With what a beautiful simplicity, and with what smoothness and harmony would the world of trade move onward in all its transactions! How many cares and anxieties would vanish! how many perplexities would cease! and how many ruinous litigations would be prevented? For the violation of truth may be considered as the chief cause of all those disputes respecting property, which have plunged so many families into suspense and wretchedness. The tribunals of justice would be purified from every species of sophistry and deceit; and the promises of kings, and the leagues of nations,

would be held sacred and inviolate. Science would rapidly advance towards perfection; for, as all its principles and doctrines are founded upon facts, when truth is universally held inviolable, the facts on which it is built will always be fairly represented. Every fact asserted by voyagers and travellers, in relation to the physical or the moral world, and every detail of experiments made by the chemist and the philosopher, would form a sure ground-work for the development of truth, and the detection of error; without the least suspicion arising in the mind respecting the veracity of the persons on whose testimony we rely. For want of this confidence the mind has been perplexed and distracted by the jarring statements of travellers, naturalists, and historians; false theories have been framed; systems have been reared on the baseless fabric of a vision; the foundations of science have been shaken; its utility called in question, and its most sublime discoveries overlooked and disregarded.

In fine, the clouds which now obscure many of the sublime objects of religion, and the realities of a future world, would be dispelled, were falsehood unknown, and truth beheld in its native light; and religion, purified from every mixture of error and delusion, would appear arrayed in its own heavenly radiance, and attract the love and the admiration of men. When exhibited in its native grandeur and simplicity, all doubts respecting its divine origin would soon vanish from the mind—the beauty and sublimity of its doctrines would be recognised as worthy of its Author; and all its moral requisitions would be perceived to be "holy, just, and good," and calculated to promote the order, and the everlasting happiness of the intelligent universe. #### THE TENTH COMMANDMENT.

*"Thou shalt not covet thy neighbour's house, thou shalt not covet thy neighbour's wife, nor his man-servant, nor his maid-servant, nor his ox, nor his ass, nor any thing that is thy neighbour's."*

Every precept of the law to which I have hitherto adverted, has a reference not only to the *external conduct* of moral agents, but also to the *internal motives or principles* from which that conduct proceeds. This is evident from the con-

vid:ratious already stated, and from the whole tenor of Divine Revelation;—and it is in unison with reason, and with the common sense of mankind, that the merit or demerit of any action is to be estimated, according to the intention of the actor, and the disposition from which it flows. That no doubt may remain on this point, the Supreme Legislator closes the decalogue with a command, which has a reference solely to the desires and dispositions of the mind: “Thou shalt not covet.” Covetousness consists in an *inordinate* desire of earthly objects and enjoyments. This desire, when uniformly indulged, leads to a breach of almost every other precept of the Divine law; and is the source of more than one half of all the evils which afflict the human race. It leads to a breach of the eighth command, by exciting either to fraudulent dealings, or to direct acts of theft and robbery.—It leads to a breach of the ninth command, by cherishing the principle of falsehood which is implied in every fraudulent transaction.—It leads to a violation of the sixth command, by engendering a spirit of revenge against those who stand in the way of its gratification; and by exciting the covetous man to the commission of murder, in order to accomplish his avaricious desires.—It also leads to a violation of the seventh command; for, when one “covets his neighbour’s wife,” the next step is to endeavour to withdraw her affection from her husband, and to plunge a family into misery and distress.—It also leads to a violation of the fifth precept of the law, not only as it steels the heart against those kindly filial affections which children ought to exercise towards their parents, but as it excites them to withhold from their parents, when in old age and distress, those external comforts which are requisite to their happiness, and which it is the duty of affectionate children to provide. And, when covetousness has thus led to the breach of every other precept of the second table of the law, it follows, that all the precepts of the first table are also virtually violated. For all the commandments of the first table are briefly summed up in this comprehensive precept, “Thou shalt love the Lord thy God with all thy heart:” but it is obviously impossible, nay, it would be a contradiction in terms, to suppose, that supreme love to the Creator can reside in the same breast in which an *inordinate* desire of worldly enjoyments reigns uncontrolled, and in which love to man has no existence. So that covetousness may be considered as the great barrier which separates between man and his Maker, and also as the polluted fountain from whence flow all the moral abominations and the miseries of mankind.

The more obvious and direct manifestation of this principle is generally distinguished by the name of *Avarice*, or an *inordinate* desire of riches. And what a countless host of evils has flowed from this unhallowed passion, both in relation to individuals, to families, to nations, and to the

world at large! In relation to the avaricious man himself, could we trace all the eager desires, anxieties, perplexities, and cares, which harass his soul; the fraudulent schemes he is obliged to contrive, in order to accomplish his object; the miserable shifts to which he is reduced, in order to keep up the appearance of common honesty; the mass of contradictions, and the medley of falsehoods, to which he is always obliged to have recourse; the numerous disappointments to which his eager pursuit of wealth continually exposes him, and by which his soul is pierced as with so many daggers—we should behold a wretched being, the prey of restless and contending passions, with a mind full of falsehoods, deceitful schemes, and grovelling affections, like a cage-full of every unclean and hateful bird,—a mind incapable of any rational enjoyment in this life, and entirely incapacitated for relishing the nobler enjoyments of the life to come. Such a man is not only miserable himself, but becomes a moral nuisance to the neighbourhood around him; stinting his own family of its necessary comforts; oppressing the widow and the fatherless; grasping with insatiable fangs every house, tenement, and patch of land within his reach; hurrying poor unfortunate debtors to jail; setting adrift the poor and needy from their long-accustomed dwellings; and presenting to the young and thoughtless a picture, which is too frequently copied, of an immortal mind immersed in the mire of the most degrading passions, and worshipping and serving the creature more than the Creator, who is blessed forever.

In relation to large communities and nations, this grovelling passion has produced, on an extensive scale, the most mischievous and destructive effects. It has plundered palaces, churches, seats of learning, and repositories of art; it has polluted the courts of judicature, and the tribunals of justice; it has corrupted magistrates, judges, and legislators; and has transformed many even of the ministers of religion, into courtly sycophants, and hunters after places and pensions. It has ground whole nations to poverty, under the load of taxation; it has levelled spacious cities with the dust; turned fruitful fields into a wilderness; spread misery over whole empires; drenched the earth with human gore; and waded through fields of blood in order to satiate its ungovernable desires. What has led to most of the wars which have desolated the earth, in every age, but the insatiable cravings of this restless and grovelling passion? It was the cursed love of gold that excited the Spaniards to ravage the territories of Mexico and Peru, to violate every principle of justice and humanity, to massacre, and to perpetrate the most horrid cruelties on their unoffending inhabitants. It is the same principle, blended with the lust of power, which still actuates the infatuated rulers of that unhappy nation, in their vain attempts to overthrow the

Independence of their former colonies. The same principle commenced, and still carries on, that abominable traffic, the *slave trade*,—a traffic which has entailed misery on millions of the sons of Africa; which has excited wars, and feuds, and massacres, among her numerous tribes; which has forever separated from each other brothers and sisters, parents and children; which has suffocated thousands of human beings in the cells of a floating dungeon, and plunged ten thousands into a watery grave;—a traffic which is a disgrace to the human species; which has transformed civilized men into infernal fiends; which has trampled on every principle of justice; which has defaced the image of God in man, and extinguished every spark of humanity from the minds of the ferocious banditti which avarice has employed for accomplishing her nefarious designs.\*

Ambition, or, an inordinate desire of power, superiority, and distinction, is another modification of this malignant principle. This passion is manifested, in a greater or less degree, by men of all ranks and characters, and in every situation in life. It is displayed in the *school-room* by the boy who is always eager to stand foremost in his class; in the *ball-room*, by the lady who is proud of her beauty, and of her splendid attire; in the *corporation-hall*, by the citizen who struts with an air of conscious dignity, and is ever and anon aiming at pompous harangues; on the *bench*, by the haughty and overbearing judge; in the *starch*, by those rulers who, like Diotrephes, "Love to have the pre-eminence;" in the *pulpit*, by the preacher whose main object it is to excite the admiration and applause of a surrounding audience; in the *streets*, by the pompous airs of the proud dame, the coxcomb, and the dashing squire; in the *village*, by him who has a better house, and a longer purse, than his neighbours; in the *hamlet*, by the peasant who can lift the heaviest stone, or fight and wrestle with the greatest strength or agility; and in the *city*, by the nobleman who endeavours to rival all his compeers in the magnificence of his mansion, and the splendour of his equipage; among the *learned*, by their eager desire to spread their name to the world, and to extend their fame to succeeding generations; and among all classes

\* That this accursed traffic is still carried on, with unabated vigour, by the civilized powers of Europe, appears from the following statement:—"The boats of a British Frigate, the *Maldstone*, boarded, in eleven days of June, 1834, no less than ten French vessels, at a single spot upon the coast of Africa; the measurement of which vessels was between 1400 and 1600 tons, while they were destined for the incarceration—we might say, the living burial—of 8000 human beings!" The report to Government says—"The schooner *La Louisa*, Capt. Armand, arrived at Gaudaloupe, during the first days of April, 1834, with a cargo of 200 negroes, the remainder of a complement of 875, which the vessel had on board. The vessel not being large enough to accommodate so great a number of men, the *overplus* were consigned ALIVE to the waves by the Captain!"

who assume airs of importance, on account of the antiquity of their families, their wealth, their exploits of heroism, and their patrimonial possessions.

But it is chiefly on the great theatre of the world that ambition has displayed its most dreadful energies, and its most overwhelming devastations. In order to gain possession of a throne, it has thrown whole nations into a state of convulsion and alarm. The road to political power and pre-eminence, has been prepared by the overflow of truth and justice, by fomenting feuds and contentions, by bribery, murder, and assassinations, by sanguinary battles, by the plunder of whole provinces, the desolation of cities and villages, and by the sighs, the groans, and lamentations of unnumbered widows and orphans. In order to raise a silly mortal to despotic power on the throne of Spain, how many human victims have been sacrificed at the altar of ambition! how many families have been rent asunder, and plunged into irremediable ruin! and how many illustrious patriots have been immured in dungeons, and have expired under the axe of the executioner! At the present moment, the fertile vales of Mexico, the mountains and plains of South America, the forests of the Burmese, and the shores of Turkey and of Greece, are every where covered with the ravages of this fell destroyer, whose path is always marked with desolation and bloodshed. To recount all the evils which ambition has produced over this vast globe, would be to write a history of the struggles and contests of nations, and of the sorrows and sufferings of mankind. So insatiable is this ungovernable passion, that the whole earth appears a field too small for its malignant operations. Alexander the Great, after having conquered the greater part of the known world, wept, because he had not another world to conquer. Were there no physical impediments to obstruct the course of this detestable passion, it would ravage, not only the globe on which we dwell, but the whole of the planetary worlds; it would range from system to system, carrying ruin and devastation in its train, till the material universe was involved in misery and desolation; and it would attempt to subvert even the foundations of the throne of the Eternal.

Such are some of the dismal and destructive effects of *covetousness*, when prosecuting the paths of avarice and ambition: and when we consider that it is uniformly accompanied in its progress, with pride, envy, discontentment, and restless desires,—it is easy to perceive, that, were it left to reign without control over the human mind, it would soon desolate every region of the earth, and produce all the destructive effects which, as we have already shown, would flow from a universal violation of the other precepts of God's law.

On the other hand, *Contentment*,—the duty implied in this command, would draw along with

is an unnumbered train of blessings, and would restore tranquillity and repose to our distracted world. To be contented under the allotments of the providence of God, is one of the first and fundamental duties of every rational creature. By contentment and resignation to the divine disposal, we recognise God as the supreme Governor of the universe; as directed by infinite wisdom, in the distribution of his bounty among the children of men; as proceeding on the basis of eternal and immutable justice, in all his providential arrangements; and as actuated by a principle of unbounded benevolence, which has a regard to the ultimate happiness of his creatures. Under the government of such a Being, we have abundant reason, not only to be contented and resigned, but to be glad and to rejoice. "The Lord reigneth, let the earth be glad, let the multitude of the isles thereof rejoice." However scanty may be the portion of earthly good measured out to us at present, and however perplexing and mysterious the external circumstances in which we may now be involved, we may rest assured, that, under the government of unerring wisdom, rectitude, and benevolence, all such dispensations shall ultimately be found to have been, not only consistent with justice, but conducive to our present and everlasting interests. Were such sentiments and affections to pervade the minds of all human beings, what a host of malignant passions would be chased away from the hearts and from the habitations of men? Restless cares, and boundless and unsatisfied desires, which constitute the source and the essence of misery, would no longer agitate and torment the human mind. Voluptuousness would no longer riot at the table of luxury on dainties, wrung from the sweat of thousands;—nor avarice glut its insatiable desires with the spoils of the widow and the orphan;—nor ambition ride in triumph over the miseries of a suffering world. Every one, submissive to the allotments of his Creator, and grateful for that portion of his bounty which he has been pleased to bestow, would view the wealth and enjoyments of his neighbour with a kind and benignant eye, and rejoice in the prosperity of all around him. Benevolence and peace would diffuse their benign influence over the nations, and mankind, delivered from the fear of every thing that might "hurt or destroy," would march forward in harmony and affection, to that happier world where every wish will be crowned, and every holy desire satisfied in God "their exceeding great reward."

Thus it appears, that, on the observance of this law, which closes the Decalogue, and which has a reference to a single affection of the mind—the order and happiness of the intelligent system almost entirely depends. Let the flood-gates of *Covetousness* be burst open, and let it flow in every direction without control,—in a short period the world is desolated, and over-

whelmed with a deluge of miseries. Let the current of every passion and desire be restrained within its legitimate boundary, and let contentment take up its residence in every heart, and this deluge will soon be dried up, and a new world will appear, arrayed in all the loveliness, and verdure, and beauty of Eden. May Jehovah hasten it in his time!

Thus I have endeavoured, in the preceding sketches, to illustrate the *reasonableness* of those laws which God has promulgated for regulating the moral conduct of the intelligent creation. If the propriety of these illustrations be admitted, they may be considered as a commentary on the words of the Apostle Paul: "*The law is holy, and the commandment is holy and just and good.*" In like manner it might have been shown, that all the Apostolic injunctions, and other precepts recorded in the volume of inspiration, are accordant with the dictates of reason, and with the relations of moral agents; for they are all so many subordinate ramifications of the principles and laws, which I have already illustrated.

*General Conclusions and Remarks, founded on the preceding illustrations.*

I shall now conclude this chapter with the statement of a few remarks in relation to the moral law, founded on the illustrations which have been given in the preceding pages; which may be considered as so many inferences deduced from the general subject which has now occupied our attention.

I. In the *first place*, one obvious conclusion from the preceding illustrations is, That the laws of God are not the commands of an arbitrary Sovereign, but are founded on the nature of things, and on the relations which exist in the intelligent system. Many divines, especially those of the supralapsarian school, have been disposed to ascribe every regulation of the Deity to the Divine Sovereignty. I have been told that, in one of the Latin treatises of Mr. Samuel Rutherford, Professor of Divinity, in St. Andrews, there is a sentiment to the following purpose: "That such is the absolute sovereignty of God, that had it so pleased him, he might have made every precept of the moral law given to man exactly the reverse of what we now find it." A sentiment more directly repugnant to the scriptural character of God, and to every view we can take of the divine attributes, it is scarcely possible for the human mind to entertain; and it shows us the dangerous consequences to which we are exposed, when we attempt to push certain theological dogmas to an extreme. If it were possible to suppose the Deity capable of such an act, it would overturn all the grounds on which we are led to contemplate him as glorious, amiable, and adorable. At some future period in the revolutions of eternity, his love, his rectitude

and his faithfulness, might be changed into malevolence, injustice, and falsehood. If the requisitions of the moral law depended solely on the Divine Sovereignty, then there is no inherent excellence in virtue; and theft, falsehood, murder, idolatry, profanity, cruelty, wars, devastations, and the malevolence of infernal demons, might become equally amiable and excellent as truth, justice, benevolence, and the songs and adorations of angels; provided the Deity *willed* the change to take place. But this is impossible; and it is evident, I trust, from the preceding illustrations, that, were moral laws, directly opposite to those contained in the scriptural code, to be prescribed to men, or to any other class of moral agents, not only would misery reign uncontrolled through the universe, but, in a short time, the operation of such laws would annihilate the whole intelligent creation.

It is evident, then, that the moral law is not founded on the will of God, but on the relations of intelligent beings, and on its own intrinsic excellence; or, in other words, on its tendency to produce happiness throughout the intelligent system. This idea nearly coincides with that of some of our modern moralists, who maintain "that virtue is founded on utility,"—if, by *utility*, is meant a tendency to promote happiness. But it by no means follows, from this position, as some moralists have concluded, that utility is the guide, or the rule by which we are to be directed in our moral conduct. This may be considered as the rule which directs the conduct of the Divine Being, whose eye takes in the whole system of creation, whose knowledge extends from eternity past, to eternity to come, and who perceives, at one glance, the remotest consequences of every action. But it cannot be a rule for subordinate intelligences, and especially for man, who stands near the lowest degree of the scale of intellectual existence. From the limited range of view to which he is confined, he cannot trace the remote consequences of any particular action, the bearings it may have on unnumbered individuals, and the relation in which it may stand to the concerns of the eternal world. An action which, to our limited view, may appear either beneficial or indifferent, may involve a principle which, if traced to its remotest consequences, would lead to the destruction of the moral universe. It might appear, at first view, on the whole, beneficial to society, that an old unfeeling miser should be gently suffocated, and his treasures applied for the purpose of rearing asylums for the aged poor, and seminaries of instruction for the young. But the principle which would sanction such an action, if generally acted upon, would lead to universal plunder, robbery, and bloodshed. To tell a lie to a child, in order to induce it to take a nauseous medicine which is essential to its recovery from disease, may appear, in such a

case, to have a benevolent tendency; but we have already shown, that were such a principle universally admitted, it would introduce anarchy and misery through the universe, and would ultimately annihilate the intelligent creation. Man, in his present state, can be directed only by *positive laws* proceeding from the Almighty, whose comprehensive mind alone can trace all their consequences to the remotest corners of the universe, and through all the ages of eternity. These laws are contained in the Scriptures—a comprehensive summary of which has been the subject of the preceding illustrations. And we know, in point of fact, that in every country where these laws are either unknown, or not recognised, there is no fixed standard of morals: and vice, in its various ramifications, almost universally prevails.

From what has been now stated we may infer—that a *full and unreserved obedience to the Divine law is a most reasonable requisition*. Men are too frequently disposed to view the commands of God as the dictates of an arbitrary Sovereign. There is a secret thought that occasionally lodges in the heart of every human being, that the law of God is too extensive and rigorous in its demands, accompanied with a secret wish, that the severity of its requisitions could be a little modified or relaxed. Every man is subject to some "besetting sin," and he is apt to say within himself—"If I were allowed but a little license with regard to one precept of the law, I would endeavour to do what I could to comply with the requisitions of the rest." But, it would be inconsistent both with the *benevolence* of the Deity, and with the happiness of his moral creation, either to modify or to relax any one requirement of his law; for it is a *perfect* law, from which nothing can be taken without impairing its excellence and utility. Were he to do so, it would be in effect, to shut up the path to happiness, and to open the flood-gates of misery upon the universe. Although it is impossible for man in his present degraded condition, to yield a *perfect* obedience to this law, yet nothing short of perfect obedience ought to be his aim. For in as far as we fall short of it, in so far do we fall short of happiness; and consequently, till that period arrives when our obedience shall reach the summit of perfection, our happiness must remain incomplete, and a certain portion of misery must be expected to mingle itself with all our enjoyments.

II. *There is so intimate a connexion between all the parts of the Divine law, that the habitual violation of any one precept necessarily includes the violation of the greater part, if not the whole of the other precepts.* This is evident from the general tenor of the preceding illustrations. It has been shown that a breach of the first commandment includes pride, falsehood, blasphemy, ingratitude, and hatred of moral excellence, and

that it leads to injustice, cruelty, murder, obscenity, and the most revolting abominations. A breach of the fifth involves a principle which would sap the foundations of all government and moral order, and transform society into a rabble of lawless banditti. The violation of the eighth is connected with falsehood, treachery, and covetousness, and leads to oppression, robbery, plunder, murders, and the devastation of empires; and the violation of the tenth, though consisting only in the indulgence of an irregular desire, is the origin of almost every other species of moral turpitude, in relation either to God or to man. In like manner it might be shown, that the strict and regular observance of any one precept is necessarily connected with a regard for all the other requirements of God's law.

III. It appears, from the preceding illustrations, that a universal violation of any one of the six precepts of the second table of the law, would lead to the entire destruction of the human race. In the case of the sixth commandment being supposed to be reversed, or universally violated, this effect would be most rapidly produced; but the destruction and complete extirpation of human beings from the earth would be as certainly effected, in the course of two or three generations, by the universal violation of any one of the other five precepts. Some of the circumstances which would necessarily produce this effect, are alluded to, in the preceding illustration of these precepts. And as the first principle of the moral law, love to God, is the foundation of the precepts contained in the second table, it is obvious, that the same effect would ultimately follow from a universal violation of the first four precepts of the Decalogue.

IV. It follows from what has hitherto been stated, That the moral law has never yet been universally violated, nor has any one of its precepts been completely reversed in the conduct of the inhabitants of our globe. Every individual, of all the millions of mankind that have existed since the fall of Adam, has, indeed, in one shape or another, broken every one of the commandments of God; but such breaches have not been constant and uniform, and running through every action he performed. Falsehood has always been mingled with a portion of truth, theft with honesty, cruelty with clemency and mercy, anarchy with subordination, and licentiousness with chastity and purity. It is owing to this partial obedience to the dictates of the law of nature, impressed upon every human heart, that the world of mankind has hitherto been preserved in existence. The partial violation, however, of the divine law, which has characterized the actions of mankind, in all ages, has been the source of all the calamities, miseries, and moral abominations, under which the earth has groaned from generation to generation; and, in proportion to the extent of this violation, will be the extent of

wretchedness and misery entailed on the human race.—That a universal violation of God's law has never yet taken place in any region of the earth, is not owing so much to any want of energy, or of malignity in the principle of disobedience which is seated in the hearts of men as to the restraining influence of the moral Governor of the world, and to the physical impediments which he has placed to prevent the diabolical passions of men from raging without control. Whether it be possible for any class of intelligent organized beings to subsist for any length of time, under a complete violation of the moral law, it is not for us positively to determine; but it is evident to a demonstration, that in the present physical condition of the human race, such a violation would unhinge the whole fabric of society, and, in a short time, exterminate the race of Adam from the earth.

V. The greater part of the precepts of the Decalogue is binding upon superior intelligences, and upon the inhabitants of all worlds, as well as upon man. For any thing we know to the contrary, there may be worlds in different regions of the universe, and even within the bounds of our planetary system, where their inhabitants are placed in circumstances similar to those in which man was placed in his paradisiacal state; and, consequently, where the precepts which compose their moral code may be exactly the same as ours. But, it is highly probable that, in general, the inhabitants of the various globes, which float in the immensity of space, differ as much in their moral circumstances and relations, as the globes themselves do in their size, their physical constitution, and their natural scenery. I have already shown, (p. 78, &c.) that there are seven precepts of our moral law which are common to the inhabitants of all worlds, namely, the *first*, *second*, *third*, *fourth*, (see p. 114,) the *sixth*, the *ninth*, and the *tenth*. And, if there be no portion of the intelligent system in which *subordination*, in a greater or less degree, does not exist, then, the fifth precept of our code must also be a law common to all intelligences. It was formerly stated, (p. 108,) that the seventh precept is in all probability, a law peculiar to the inhabitants of the earth, during the present economy of Providence; and, perhaps it is the only one which is not applicable to the other inhabitants of the universe. So that the moral laws given to man may be considered as substantially the same with those which govern all the other parts of the universal system.

VI. From the preceding illustrations, we may infer, the excellency and the divine origin of the Christian Revelation. The Scriptures contain the most impressive evidence of their heavenly original in their own bosom. The wide range of objects they embrace, extending from the commencement of our earthly system, through all the revolutions of time, to the period of its termi-

nation · and from the countless ages of eternity past, to the more grand and diversified scenes of eternity to come—the plan of Providence which they unfold, and the views they exhibit of the moral principles of the Divine government, and of the subordination of all events to the accomplishment of a glorious design—the character and attributes of the Creator, which they illustrate by the most impressive delineations, and the most lofty and sublime descriptions—the views they exhibit of the existence, the powers, the capacities, the virtues, and the employments of superior orders of intellectual beings—the demonstrations they afford of the dignified station, and of the high destination of man—and the sublime and awful scenes they unfold, when the earth “shall melt like wax at the presence of the Lord,” when the throne of judgment shall be set, and the unnumbered millions of the race of Adam shall be assembled before the Judge of all—infinity surpass every thing which the unassisted imaginations of men could have devised, and every thing which had ever been attempted by the greatest sages of antiquity, either in prose or in rhyme; and, consequently prove, to a moral demonstration, that a Power and Intelligence, superior to the human mind, must have suggested such sublime conceptions, and such astonishing ideas; since there are no prototypes of such objects to be found within the ordinary range of the human mind.

But the subject to which we have been hitherto adverting, when properly considered, suggests an evidence of the truth and divinity of the Scriptures, as striking, and, perhaps, more convincing than any other. They unfold to us the moral laws of the universe—they present to us a summary of moral principles and precepts, which is applicable to all the tribes and generations of men, to all the orders of angelic beings, and to all the moral intelligences that people the amplitudes of creation—to man, during his temporary abode on earth, and to man, when placed in heaven, so long as eternity endures—precepts, which, if universally observed, would banish misery from the creation, and distribute happiness, without alloy, among all the intellectual beings that exist throughout the empire of God. Can these things be affirmed of any other system of religion or of morals that was ever published to the world? The Greek and Roman moralists, after all their laboured investigations, could never arrive at any certain determination with regard to the nature of happiness, and the means of attaining it. We are told by Varro, one of the most learned writers of the Augustan age, that, the heathen philosophers had embraced more than two hundred and eighty different opinions respecting the supreme good. Some of them taught that it consisted in sensual enjoyments, and in freedom from pain; others considered it as placed in study and contemplation, in military

glory, in riches, honours, wealth, and fame. Some of their moral maxims, separately considered, were rational and excellent; but they were connected with other maxims, which completely neutralized all their virtue, and their tendency to produce happiness. Pride, falsehood, injustice, impurity, revenge, and an unfeeling apathy to the distresses of their fellow-creatures, were considered as quite consistent with their system of morality; and such malignant principles and practices were blended with their most virtuous actions. But we have already shown, that the uniform operation of such principles would necessarily lead to the destruction of all happiness, and to the overthrow of all order throughout the intelligent creation.

Now, can it be supposed, for a moment, that a Jew, who had spent forty years of his life as a shepherd in a desert country, who lived in a rude age of the world, who had never studied a system of ethics, and whose mind was altogether incapable of tracing the various relations which subsists between intelligent beings and their Creator, could have investigated those moral principles and laws which form the foundation of the moral universe, and the basis of the divine government in all worlds; unless they had been communicated immediately by Him, who, at one glance, beholds all the physical and moral relations which exist throughout creation, and who can trace the bearings and the eternal consequences of every moral law? Or can we suppose, that, throughout the whole period of the Jewish economy, and during the first ages of the Christian dispensation, a multitude of writers should appear, many of them unknown to each other, all of whom should uniformly recognise those laws in their minutest bearings and ramifications, unless their minds had been enlightened and directed by the same powerful and unerring Intelligence? If these laws are distinguished by their extreme simplicity, they are the more characteristic of their divine Author, who, from the general operation of a few simple principles and laws in the system of nature, produces all the variety we perceive in the material world, and all the harmonies, the contrasts, the beauties, and the sublimities of the universe. If it be asked why these laws, which are so extremely simple and comprehensive, were not discovered nor recognised by the ancient sages? It might be answered, by asking why the laws of gravitation, which are also simple and comprehensive, were not discovered, till Newton arose to investigate the agencies of nature, and to pour a flood of light on the system of the universe? But the true reasons are—the unassisted powers of the human mind were inadequate to the task of surveying all the moral relations which subsist throughout the intelligent system, and of tracing those moral principles which would apply to the whole assemblage of moral agents, so as to re-

cure the happiness of each individual, and of the system as one great whole—that the laws of God were almost directly contrary to the leading maxims of morality which prevailed in the world—and that they struck at the root of all these principles of pride, ambition, revenge, and iniquity, which almost universally directed the conduct of individuals and of nations.

If, then, we find in a book which professes to be a revelation from heaven, a system of moral laws which can clearly be shown to be the basis of the moral order of the universe, and which are calculated to secure the eternal happiness of all intellectual beings—it forms a strong presumptive proof, if not an unanswerable argument, that the contents of that book are of a celestial origin, and were dictated by Him who gave birth to the whole system of created beings.

VII. From this subject we may learn the absurdity and pernicious tendency of Antinomianism. Of all the absurdities and abominations which have assumed the name of Religion, I know none more pernicious and atheistical in its tendency, than the sentiment which is tenaciously maintained by modern Antinomians, “That Christians are set free from the law of God as a rule of conduct.” That in the nineteenth century of the Christian era, amidst the rapid progress of physical and moral science, under the mask of a Christian profession, and with the moral precepts and injunctions of the prophets of Jesus Christ, and of his apostles, lying open before them, a set of men, calling themselves rational beings, should arise to maintain, that there is such a thing as “imputed sanctification,” that the moral law is not obligatory upon Christians, and that “whoever talks of progressive sanctification is guilty of high treason against the majesty of heaven”—is a moral phenomenon truly humbling and astonishing; and affords an additional proof, to the many other evidences which lie before us, of the folly and perversity of the human mind, and of its readiness to embrace the most wild and glaring absurdities! If the leading train of sentiment which has been protracted in the preceding illustrations be admitted, there appears nothing else requisite in order to show the gross absurdity and the deadly malignity of the Antinomian system. If any system of religion be founded on the cancellation of every moral tie which connects man with man, and man with God—if its fundamental and distinguishing principles, when carried out to their legitimate consequences, would lead men to hate their Creator and to hate one another—if it can be shown, that the operation of such principles constitutes the chief ingredient of the misery which arises from “the worm that never dies,

and the fire which is never quenched;” and that, if universally acted upon, they would overthrow all order in the intelligent system, and banish every species of happiness from the universe—it necessarily follows, that such a system cannot be the religion prescribed by the All-wise and benevolent Creator, nor any part of that revelation which proclaims “peace on earth and goodwill among men,” and which enjoins us to “love the Lord our God with all our hearts, and our neighbour as ourselves.”

The Antinomian, in following out his own principles, if no human laws or prudential considerations were to deter him, might run to every excess of profligacy and debauchery—might indulge in impiety, falsehood, and profanity—might commit theft, robbery, adultery, fraud, cruelty, injustice, and even murder, without considering himself as acting contrary to the spirit of his religious system. On his principles, the idea of heaven, or a state of perfect happiness, is a physical and moral impossibility; and the idea of hell a mere bugbear to frighten children and fools. For, wherever the moral law is generally observed, there can be no great portion of misery experienced under the arrangements of a benevolent Creator; and if this law be set aside, or its observance considered as a matter of indifference, the foundation of all the happiness of saints and angels is necessarily subverted. A heaven without love pervading the breasts of all its inhabitants, would be a contradiction in terms; but love, as we have already seen, is the foundation of every moral precept.

I trust the moral conduct of the deluded mortals who have embraced this system is more respectable than that to which their principles naturally lead;—but the consideration, that such absurd and dangerous opinions have been deduced from the Christian revelation, should act as a powerful stimulus on the Christian world, for directing their attention to a more minute and comprehensive illustration than has hitherto been given, of the *practical bearings* of the Christian system, and of the eternal and immutable obligation of the law of God, which it is the great end of the gospel of Christ to enforce and demonstrate. For it is lamentable to reflect how many thousands of religionists, both in North and in South Britain, even in the present day, have their minds tinctured, in a greater or less degree, with the poison of Antinomianism, in consequence of the general strain of many of the doctrinal sermons they are accustomed to hear, and of the injudicious sentiments they have imbibed from the writings of the supralapsarian divines of the seventeenth century.

VIII. Faith and repentance, as required in the Gospel, are absolutely necessary, in the present condition of man, in order to acceptable obedience to the divine law. “Without faith it is impossible to please God; for he that cometh

\* See Cottle's “*Strictures on the Plymouth Antinomians*.”

to God must believe that he is, and that he is the rewarder of them that diligently seek him."—Faith, as the term is used in scripture, denotes confidence in the moral character of God, founded on the belief we attach to the declarations of his word. It is defined, by the Apostle Paul, in the eleventh chapter of the epistle to the Hebrews, to be "the confident expectation of things hoped for," and "the conviction of things which are not seen."<sup>\*</sup> Faith substantiates and realizes those objects which are invisible to the eye of sense, and which lie beyond the reach of our present comprehension. It recognises the existence and the omnipresence of an invisible Being, by whose agency the visible operations of nature are conducted; and views him as possessed of infinite wisdom, power, benevolence, faithfulness, rectitude, and eternal duration. It realizes the scenes of an invisible and eternal world—the destruction of the present fabric of our globe, the resurrection of the dead, the solemnities of the last judgment, the new heavens, and the new earth, the innumerable company of angels, and the grandeur and felicity of the heavenly world. These invisible realities it recognises, on the testimony of God exhibited in his word; and without a recognition of such objects, religion can have no existence in the mind.—In a particular manner, faith recognises the declarations of God in relation to the character and the condition of men as violators of his law, and as exposed to misery; and the exhibition which is made of the way of reconciliation, through the mediation of Jesus Christ, who is "set forth as a propitiation to declare the righteousness of God in the remission of sins." The man in whose heart the principle of faith operates, convinced that he is guilty before God, and exposed to misery on account of sin, *confides* in the declarations of God respecting "the remission of sins through the redemption that is in Christ Jesus;"—he confides in the goodness, mercy, faithfulness, and power of God, which secure the accomplishment of his promises, and the supply of all requisite strength and consolation to support him amidst the dangers and afflictions of life; he confides in the wisdom and excellence of those precepts which are prescribed as the rule of his conduct, and which are fitted to guide him to the regions of happiness;—and in the exercise of this confidence, he "adds to his faith, fortitude and resolution, knowledge, temperance, patience, godliness, brotherly kindness, and charity;" and prosecutes with courage this course of obedience, till at length "an entrance is abundantly administered to him into the everlasting kingdom of our Lord and Saviour, Jesus Christ." But, without a recognition of such objects, and an unshaken confidence in the declarations of God respecting them, it is obvious, from the nature of things,

that we "cannot please God," nor yield to him an acceptable and "reasonable service."

In like manner it might be shown, that repentance is essentially requisite in order to acceptable obedience. Sin is directly opposed to the character of God, and is the great nuisance of the moral universe. While the love of it predominates in any mind, it leads to every species of moral turpitude and depravity; and, consequently, completely unfits such a mind for yielding a cheerful obedience to the divine law. But repentance, which consists in hatred of sin, and sorrow for having committed it, naturally fits and prepares the mind for the practice of universal holiness. It tends to withdraw the soul from the practice of sin, and warns it of the danger of turning again to folly. It is the commencement of every course of virtuous conduct, and the avenue which ultimately leads to solid peace and tranquillity of mind. It is intimately connected with humility and self-denial, and is directly opposed to pride, vanity, and self-gratulation. It must, therefore, be indispensably requisite to prepare us for conformity to the moral character of God, for universal obedience to his law, and for the enjoyment of substantial and never-ending felicity. Hence the importance which is attached to the exercise of repentance by our Saviour and his Apostles. In connexion with faith, it is uniformly represented as the first duty of a sinner, and the commencement of the Christian life. Repentance was the great duty to which the forerunner of the Messiah called the multitudes who flocked to his baptism, and on which the Messiah himself expatiated during the period of his public ministry. "Repent ye, for the kingdom of heaven is at hand." "Except ye repent, ye shall all likewise perish." And the apostles, in their instructions to every nation and to every class of men, laid down the following positions as the foundation of every moral duty. "Repentance towards God, and faith towards our Lord Jesus Christ."

IX. From the preceding illustrations we may learn, that no merit, in the sense in which that term is sometimes used, can be attached to human actions in the sight of God; and that the salvation, or ultimate happiness of sinners, is the effect of the grace or benevolence of God.—That the good works of men are meritorious in the sight of God, is a notion, as unphilosophical and absurd, as it is impious and unscriptural. They are requisite, and indispensably requisite, as qualifications, or preparations for the enjoyment of felicity, without which the attainment of true happiness either here or hereafter, is an absolute impossibility; but the actions of no created being, not even the sublimest services and adorations of the angelic hosts, can have the least merit in the eyes of the Creator. "Thy wickedness may hurt a man as thou art, and thy righteousness may profit the son of man;" but "if thou

<sup>\*</sup> Doddridge's translation of Heb. xi. 1.

sinners, what dost thou against God ; or, if thou be righteous, what givest thou him ? and what receiveth he of thine hand ?" \* " Thy goodness extendeth not unto him," and he that sinneth against him wrongeth his own soul."—What merit can there be in the exercise of love, and in the cultivation of benevolent affections, when we consider, that these affections are essentially requisite to our happiness, and that the very exercise of them is a privilege conferred by God, and one of the principal ingredients of bliss ? What merit can be attached, in the presence of the Most High, to the noblest services we can perform, when we reflect, that we derived all the corporeal and intellectual faculties by which we perform these services, and all the means by which they are excited and directed, from our bountiful Creator ? What merit can there be in obedience to his law, when disobedience must infallibly lead to destruction and misery ? Is it considered as meritorious in a traveller, when he is properly directed, furnished with strength of body and mind, and provided with every necessary for his journey,—to move forward to the place of his wished for destination ? Our benevolent affections, and the active services to which they lead, may be meritorious in the eyes of our fellow-men, in so far as they are the means of contributing to their enjoyment ; but in the presence of Him who sits on the throne of the universe, dispensing blessings to all his offspring, we shall always have to acknowledge, that " we are unprofitable servants." It is probable, that, if the great object of religion were represented in its native simplicity, if the nature of salvation were clearly understood, and if less were said on the subject of human merit in sermons, and systems of divinity, the idea which I am now combating, would seldom be entertained by any mind possessed of the least share of Christian knowledge, or of common sense.

That the eternal salvation of men, is the effect of the love and the grace of God, is also a necessary consequence from what has been now stated.

\* Job xxxiv. 6. 8. Psalm xvi. 2 &c.

For every power, capacity, and privilege we possess, was derived from God. " What have we that we have not received ?" Even our very existence in the world of life, is an act of grace. We exerted no power in ushering ourselves into existence : We had no control over the events which determined that we should be born in Britain, and not in Africa ; which determined the particular family with which we should be connected ; the education we should receive ; the particular objects towards which our minds should be directed, and the privileges we should enjoy. And, when we arrive at the close of our earthly career, when the spirit is hovering on the verge of life, and about to take its flight from this mortal scene, can it direct its course, by its own energies, through the world unknown ? can it wing its way over a region it has never explored, to its kindred spirits in the mansions of bliss ? can it furnish these mansions with the scenes and objects from which its happiness is to be derived ? can it re-animate the body after it has long mouldered in the dust ? can it re-unite itself with its long-lost partner ? can it transport the resurrection-body, to that distant world where it is destined to spend an endless existence ? or can it create those scenes of glory and magnificence, and those ecstatic joys which will fill it with transport while eternity endures ? If it cannot be supposed to accomplish such glorious objects by its own inherent powers, then, it must be indebted for every entertainment in the future world to the unbounded and unmerited love and mercy of God. To Him, therefore, who sits upon the throne of the heavens, and to the Lamb who was slain and hath redeemed us to God by his blood, let all praise, honour, dominion, and power, be ascribed now and forever. Amen.

Having now finished what I proposed in the illustration of the principles of love to God and to man, and of the precepts of the Decalogue,—in the following chapter, I shall take a bird's eye view of the moral state of the world ; and endeavour to ascertain, to what extent these principles and laws have been recognised and observed by the inhabitants of our globe.

## CHAPTER IV.

### A BRIEF SURVEY OF THE MORAL STATE OF THE WORLD; OR, AN EXAMINATION OF THE GENERAL TRAIN OF HUMAN ACTIONS, IN REFERENCE TO ITS CONFORMITY WITH THE PRINCIPLES AND LAWS NOW ILLUSTRATED.

THE discoveries of modern astronomy have led us infallibly to conclude, that the universe consists of an immense number of systems and worlds dispersed, at immeasurable distances from each other, throughout the regions of infinite space. When we take into consideration the *Benevolence* of the Deity, and that the happiness of the intelligent creation is the great object which his Wisdom and Omnipotence are employed to accomplish—it appears highly probable, that the inhabitants of the whole, or at least of the greater part, of those worlds whose suns we behold twinkling from afar, are in a state of moral perfection, and consequently, in a state of happiness. At any rate, it is reasonable to conclude, that the exceptions which exist are not numerous. Perhaps this earth is the only material world where physical evil exists, where misery prevails, and where moral order is subverted; and these dismal effects may have been permitted to happen, under the government of God, in order to exhibit to other intelligences, a specimen of the terrible and destructive consequences of moral evil, as a warning of the danger of infringing, in the least degree, on those moral principles which form the bond of union among the intelligent system.

Could we trace the series of events which have occurred, in any one of those happy worlds, where moral perfection prevails, ever since the period when it was replenished with inhabitants, and the objects to which their physical and rational powers have been directed, we should, doubtless, be highly delighted and enraptured with the moral scenery which the history of such a world would display. Its annals would uniformly record the transactions of *benevolence*. We should hear nothing of the pomp of hostile armies, of the shouts of victory, of the exploits of heroes, of the conflagration of cities, of the storming of fortifications, of the avarice of merchants and courtiers, of the burning of heretics, or of the ambition of princes. The train of events, presented to our view, would be directly opposed to every object of this description, and to every thing which forms a *prominent* feature in the history of mankind. To beautify and adorn the scenery of nature around them, to extend their views of the operations of the Almighty, to explore the depths of his wisdom and intelligence, to admire the *exuberance* of his goodness, to celebrate, in unison

the praises of the “King Eternal,” the Author of all their enjoyments, to make progressive advances in moral and intellectual attainments, to circulate joy from heart to heart, to exert their ingenuity in the invention of instruments by which their physical powers may be improved, and the wonders of creation more minutely explored; to widen the range of delightful contemplation, to expand their views of the Divine perfections, and to increase the sum of happiness among all their fellow-intelligences, will doubtless form a part of the employments of the inhabitants of a world where moral purity universally prevails. One circumstance which may probably diversify the annals of such a world, and form so many eras in its history, may be the occasional visits of angelic or other messengers, from distant regions of creation, to announce the will of the Almighty on particular emergencies, to relate the progress of new creations in other parts of the Divine Empire, and to convey intelligence respecting the physical aspects, the moral arrangements, and the history of other worlds, and of other orders of intellectual beings. Such visits and occasional intercourses with celestial beings, would, undoubtedly, have been more frequent in our world, had not man rendered himself unqualified for such associations, by his grovelling affections, and by the moral pollutions with which his character is now stained.

When we turn our eyes from the transactions of such a world, to the world in which we live, how very different a scene is presented to the view! The history of all nations embraces little more than

### A RECORD OF THE OPERATIONS OF MALEVOLENCE.

Every occurrence has been considered as tame and insipid, and scarcely worthy of being recorded, unless it has been associated with the confused noise of warriors, the shouts of conquerors, the plunder of provinces, the devastation of empires, the groans of mangled victims, the cries of widows and orphans, and with garments rolled in blood. When such malevolent operations cease for a little, in any part of the world, and the tumultuous passions which produced them, subside into a temporary calm, the historian is presented with a *blank* in the annals of the human race, the short interlude of peace and of apparent

tranquillity is passed over as unworthy of notice, till the restless passions of avarice and ambition be again roused into fury, and a new set of desperadoes arise, to carry slaughter and desolation through the nations. For, during the short temporary periods of repose from the din of war, which the world has occasionally enjoyed, the malignant passions, which were only smothered, but not extinguished, prevented the operation of the benevolent affections; and, of course, no extensive plans for the counteraction of evil, and the improvement of mankind, worthy of being recorded by the annalist and the historian, were carried into effect.

In order to produce a definite impression of the moral state of the world, I shall endeavour, in this chapter, to give a rapid sketch of the prominent dispositions of mankind, as displayed in the general train of human actions—that we may be enabled to form a rude estimate of the degree in which the law of God has been recognised, and of the extent to which its violation has been carried, on the great theatre of the world, and in the ordinary transactions of general society.

I shall, in the first place, take a rapid view of the moral state of the world in ancient times, and then take a more particular survey of the present state of morals, among savage and civilized nations—in the Christian world—and among the various ranks and orders of society.

## SECTION I.

### STATE OF MORALS IN THE ANCIENT WORLD.

MAN was originally formed after the moral image of his Maker. His understanding was quick and vigorous in its perceptions; his will subject to the divine law, and to the dictates of his reason; his passions serene and uncontaminated with evil; his affections dignified and pure; his love supremely fixed upon his Creator; and his joy unmingled with those sorrows which have so long been the bitter portion of his degenerate race. But the primogenitor of the human race did not long continue in the holy and dignified station in which he was placed. Though he was placed in “a garden of delights,” surrounded with every thing that was delicious to the taste and pleasant to the eye, yet he dared to violate a positive command of his Maker, and to stretch forth his impious hand to pluck and to taste the fruit of the forbidden tree—a picture and a prelude of the conduct of millions of his degraded offspring who despise the lawful enjoyments which lie within their reach, and obstinately rush on forbidden pleasures, which terminate in wretchedness and sorrow. The dismal effects of the depraved dispositions thus introduced among the human species, soon became apparent. Cain, the first-born son of Adam, had no sooner reached to the years

of maturity, than he gave vent to his revengeful passions, and imbrued his hands in his brother's blood. And ever since the perpetration of this horrid and unnatural deed, the earth has been drenched with the blood of thousands and of millions of human beings, and the stream of corruption has flowed without intermission, and in every direction around the globe.

Of the state of mankind in the ages before the flood, the sacred history furnishes us with only a few brief and general descriptions. But those descriptions, short and general as they are, present to us a most dreadful and revolting picture of the pitch of depravity and wickedness to which the human race had arrived. We have the testimony of God himself to assure us, that, within 1600 years from the creation of the world, “the wickedness of man had become great upon the earth—that the earth was filled with violence”—yea, that “every imagination of the thoughts of man's heart was only evil continually,”—or, as it may more literally be rendered from the Hebrew, “the whole imagination, comprehending all the purposes and desires of the mind, was only evil from day to day.”—“God looked upon the earth; and behold it was corrupt; for all flesh had corrupted their way upon the earth.” A more comprehensive summary of the greatness and the extent of human wickedness it is scarcely possible to conceive. The mind is left to fill up the outline of this horrid picture with every thing that is degrading to the human character, with every thing that is profligate and abominable in manners, with every thing that is base, false, deceitful, licentious, and profane, and with every thing that is horrible and destructive in war, and ruinous to the interests of human happiness.

The description now quoted, contains the following intimations:—1. That, previous to the deluge, wickedness had become universal. It was not merely the majority of mankind that had thus given unbounded scope to their licentious desires, while smaller societies were to be found in which the worship of the true God, and the precepts of his law were observed. For “*all flesh* had corrupted their ways.” And, at this period the world is reckoned to have been much more populous than it has been in any succeeding age, and to have contained at least ten billions of inhabitants, or many thousands of times the amount of its present population. So that universal wickedness must have produced misery among human beings to an extent of which we can form no adequate conception. 2. The description implies, that every invention, and every purpose and scheme devised both by individuals and by communities, *was of a malevolent nature*. “The imagination of every man's heart was *only evil* continually.” The dreadful spectacles of misery and horror which the universal prevalence of such principles and practices which then

existed, must have produced, are beyond the power of human imagination either to conceive or to delineate. Some faint idea, however, may be formed of some of these spectacles, from the descriptions I have already given of the effects which would inevitably follow, were the principle of *benevolence* to be eradicated from the mind, or were any one of the precepts of the divine law to be universally violated—(see ch. ii. sect. iv. and ch. iii. throughout.) 3. The *effects* produced by this universal depravity are forcibly expressed in the words, “The earth was filled with violence.” From this declaration we are necessarily led to conceive a scene in which universal anarchy and disorder, devastation and wretchedness, every where prevailed—the strong and powerful forcibly seizing upon the wealth and possessions of the weak, violating the persons of the female sex, oppressing the poor, the widow, and the fatherless, overturning the established order of families and societies, plundering cities, demolishing temples and palaces, desolating fields, orchards, and vineyards, setting fire to towns and villages, and carrying bloodshed and devastation through every land—a scene in which cruelty, injustice, and outrages of every kind, obscenity, revelry, riot, and debauchery of every description, triumphed over every principle of decency and virtue—a scene in which the earth was strewed with smoking ruins, with the fragments of human habitations, with mangled human beings in a state of wretchedness and despair, and with the unburied carcasses of the slain.

Such appears to have been the state of general society at the time when Noah was commanded to build an ark of refuge—a state of society which could not have long continued, but must inevitably, in the course of a few generations, have thinned the race of mankind, and ultimately have extirpated the race of Adam from the earth, even although the deluge had never been poured upon the world. Wickedness appears to have come to such a height, that no interposition of Providence could be supposed available to produce a reformation among mankind, without destroying their freedom of will; and, therefore, it was an act of *mercy*, as well as of judgment, to sweep them away at once by the waters of the flood, after having given them warnings of their danger; in order to convince such obstinate and abandoned characters, that “there is a God that judgeth in the earth;” and in order to prevent the misery which would otherwise have been entailed on succeeding generations.

Not only the Sacred, but also the Pagan writers, when alluding to the antediluvians, uniformly represent them as abandoned to uncleanness, and all kinds of wickedness. Eutychus, in his *Annals*, when speaking of the posterity of Cain, says, “that they were guilty of all manner of filthy crimes with one another, and, meeting to-

gether in public places for that purpose, two or three men were concerned with the same woman the ancient women, if possible, being more lustful and brutish than the young. Nay, fathers lived promiscuously with their daughters, and the young men with their mothers, so that neither the children could distinguish their own parents, nor the parents know their own children.”—Lucian, a native of Samosata, a town situated on the Euphrates, a spot where memorials of the deluge were carefully preserved, gives the following account of the antediluvians:—“The present race of mankind,” says he, “are different from those who first existed; for those of the antediluvian world were all destroyed. The present world is peopled from the sons of Deucalion [or Noah;] having increased to so great a number from one person. In respect of the former brood, they were men of violence, and lawless in their dealings. They were contentious, and did many unrighteous things; they regarded not oaths, nor observed the rights of hospitality, nor showed mercy to those who sued for it. On this account they were doomed to destruction: and for this purpose there was a mighty eruption of waters from the earth, attended with heavy showers from above; so that the rivers swelled, and the sea overflowed, till the whole earth was covered with a flood, and all flesh drowned. Deucalion alone was preserved to re-people the world. This mercy was shown to him on account of his piety and justice. His preservation was effected in this manner:—He put all his family, both his sons and their wives, into a vast ark which he had provided, and he went into it himself. At the same time animals of every species—bears, horses, lions, serpents, whatever kind lived upon the face of the earth—followed him by pairs; all which he received into the ark, and experienced no evil from them; for there prevailed a wonderful harmony throughout, by the immediate influence of the Deity. Thus were they wafted with him as long as the flood endured.”

Such is the account which Lucian gives of the antediluvian world, and of the preservation of the human race, as he received it from the traditions of the inhabitants of Hierapolis, in Syria, where the natives pretended to have very particular memorials of the deluge. It corroborates the facts stated in the sacred history, and bears a very near resemblance to the authentic account which has been transmitted to us by Moses.—These facts, respecting the depravity of the antediluvians, present to us a striking example, and a demonstrative evidence of the dreadful effects to which a general violation of the divine law necessarily leads; and of the extensive confusion and misery which are inevitably produced, when the law of love is set aside, and when malevolence exerts, without control, its diabolical energies. All order in society is subverted, every species of rational happiness is destroyed, and

the existence of intelligent beings, in such a state, becomes a curse to themselves, and to all around them. Had not this been the case in the primeval world, we cannot suppose that the Deity would have exerted his Omnipotence in shattering the crust of the terraqueous globe, and burying its inhabitants under the waters of a deluge.

After the deluge had subsided, and the race of Noah had begun to multiply on the earth, it was not long before the depravity of man began to show itself by its malignant effects; though human wickedness has never arrived to such a pitch as in the times before the flood; for this reason, among others, that the life of man has been reduced to a narrow span, which prevents him from carrying his malevolent schemes to such an extent as did the inhabitants of the world before the flood, whose lives were prolonged to the period of nearly a thousand years. The lust of ambition soon began to exert its baleful influence over the mind; and an inordinate desire after wealth, distinctions, and aggrandizement, paved the way for the establishment of despotism, and for encroachments on the rights and the enjoyments of mankind. Among the heroes and despots of antiquity, *Nimrod*, the founder of the Babylonish empire, holds a distinguished place. He was the grandson of *Ham*, the son of Noah, and is the first one mentioned in Scripture who appears to have made invasions on the territories of his neighbours. Having distinguished himself, by driving from his country the beasts of prey, and by engaging in other valorous exploits, he appears to have aspired after regal dignity and power, and to have assumed the reins of absolute government. He was the first that subverted the patriarchal government; and is supposed to have introduced, among his subjects, the *Zabian* idolatry, or the worship of the heavenly host. "The beginning of his kingdom," we are told, "was Babylon, and Erech, and Accad, and Calneh, in the land of Shinar." In the footsteps of this proud and ambitious despot, has followed a train of Alexanders, Cæsars, Hannibals, Jenghiz-Kans, Attilas, Alaric, Tamerlanes, Marlboroughs, Fredericks, and Bonapartes, who have driven the plough-share of devastation through the world, erected thrones over the graves of slaughtered nations, decorated their palaces with trophies dyed in blood, and made the earth to resound with the groans and shrieks of dying victims, and the voice of mourning, lamentation, and woe.

To delineate all the scenes of desolation and horror which have been produced by such desperadoes, and the atrocious crimes and immoralities which have followed in their train, would be to transcribe the whole records of ancient and modern history, which contain little else than a register of human folly, avarice, ambition, and cruelty; and of the daring villanies with which they have been accompanied. Even then, we

should acquire but a very limited conception of the extent of moral evil, and of the immense variety of shapes which it has assumed; for the one tenth of the crimes of mankind has never been recorded; and it is to the public transactions of only a small portion of the world that the page of the historian directs our attention. I shall, therefore, content myself with stating a few insulated facts, as specimens of the train of actions which have generally prevailed in the world.

#### WARLIKE DISPOSITIONS OF MANKIND.

*War*, as already noticed, has been the delight and the employment of man in every age; and, under this term may be included every thing that is base and execrable in moral conduct, every thing that is subversive of the principle of benevolence, every thing that is destructive of human enjoyment, every thing that rouses the passions into diabolical fury, every thing that adds to the sum of human wretchedness, every thing that is oppressive, cruel, and unjust, and every thing that is dreadful and appalling to mankind.—As an exemplification of the destructive effects of war, I shall, in the first place, state a few facts in relation to the Carthaginians.

Carthage was originally a small colony of Phenicians, who, about 800 years before the Christian era, settled on the northern coast of Africa, on a small peninsula, adjacent to the bay of Tunis. Having increased in wealth and power, by means of their extensive commerce, like most other nations, they attempted to make inroads on the territories of neighbouring tribes, and to plunder them of their treasures. By degrees they extended their power over all the islands in the Mediterranean, Sicily only excepted. For the entire conquest of this island, about 480 years before Christ, they made vast preparations, which lasted for three years. Their army consisted of 300,000 men; their fleet was composed of upwards of 2000 men of war, and 3000 transports. With such an immense armament, they made no doubt of conquering the whole island in a single campaign. But they found themselves miserably deceived. Hamilcar, the most experienced captain of the age, sailed from Carthage with this formidable army, and invested the city of Hymera. The besieged were much straitened and dismayed by the operations of this powerful armament; but Gelon, the tyrant of Syracuse, flew immediately to their relief, with 50,000 foot and 5000 horse. A dreadful slaughter ensued: an hundred and fifty thousand of the Carthaginians were killed in the battle and pursuit, and all the rest taken prisoners; so that not a single person escaped of this mighty army. Of the 2000 ships of war, and the 3000 transports of which the fleet consisted, *eight* ships only, which then happened to be out at sea, made their escape: these immediately set sail for Carthage, but were

all cast away, and every soul perished, except a few who were saved in a small boat, and at last reached Carthage with the dismal tidings of the total loss of the fleet and army.—Here we have presented to our view, in one short struggle, the entire destruction of more than *two hundred thousand* human beings, if we take into account the number which must necessarily have fallen in the Sicilian army. And, if we take into consideration the many thousands of mangled wretches, whose existence, from that moment, would be rendered miserable; the destruction of property in the besieged city; the victims crushed to death amidst the ruins of falling houses; the cries, and shrieks, and lamentations of women and children; the diseases and the misery induced by terror and alarm, and the loss of friends; the terrific and appalling spectacle of 5000 ships all on a blaze, of ten thousands of burning and drowning wretches, supplicating in vain for mercy, and the oaths, execrations, and furious yells which would be mingled with this work of destruction, we shall find it difficult to form an adequate conception of the miseries and horrors of such a scene. And what was the cause of this dreadful slaughter and devastation? That a proud and opulent city, whose inhabitants were rioting in every species of luxury, might gratify its ambition, by tyrannizing over neighbouring tribes, and by plundering them of that wealth of which it did not stand in need. And this is but *one* instance out of ten hundred thousand of the miseries of war,—one *faint shade* in the picture of human wo!

One would have thought, that, after such a signal loss and discomfiture, the Carthaginians would have contented themselves with their own territory, and refrained from aggressive war. This, however, was not the case. Where benevolence is banished from the mind, and revenge occupies its place in the affections, it will hurry unprincipled men to the most wild and atrocious actions, although they should terminate in destruction to themselves and to all around them. It was not long after this period, when preparations were again made for the invasion of Sicily. Hannibal, the grandson of Hamilcar, landed on the coast of Sicily, and laid siege to Selinus. The besieged made a vigorous defence; but at last the city was taken by storm, and the inhabitants were treated with the utmost cruelty. All were massacred by the savage conquerors, except the women, who fled to the temples;—and these escaped, not through the merciful dispositions of the Carthaginians, but because they were afraid, that, if driven to despair, they would set fire to the temples, and by that means consume the treasure they expected to find in those places. Sixteen thousand were massacred; the women and children, about 5000 in number, were carried away captive; the temples were plundered of all their treasures, and the city razed to the ground.

Hymera was next besieged by Hannibal, and razed to its foundations. He forced three thousand prisoners to undergo all kinds of ignominy and punishments, and at last murdered them, on the very spot where his grandfather had been killed by Gelon's cavalry, to appease and satisfy his *manes*, by the blood of these unhappy victims. such is the *humanity* and the *justice* of those men, whom we are accustomed to distinguish by the names of *Patriots* and *Heroes*!—Elated with these partial victories, the Carthaginians meditated the reduction of the whole of Sicily. They marched against the city of Agrigentum, and battered its walls with dreadful fury. The besieged defended themselves with incredible resolution. In a sally, they burned all the battering machines raised against their city, and repulsed the enemy with immense slaughter. Again the Carthaginians rallied their forces, beat down the walls of the city, plundered it of an immense booty, and with their usual cruelty, put all its inhabitants to the sword, not excepting even those who had fled to the temples. The Carthaginians were soon after forced to retire from Sicily. Again they renewed their expeditions; again they were repulsed; and again they plunged into the horrors of war; while thousands and ten thousands were slaughtered at every onset; men, women, and children massacred in cold blood and the pestilence produced by the unburied carcasses of the slain, proved more fatal to myriads, than even the sword of the warrior.

In this manner did these infatuated mortals carry on a series of sanguinary contests for several centuries, with the Sicilians, Greeks, and other nations; till, at length, they dared to encounter the power, and the formidable forces of the Romans, and commenced those dreadful and long-continued conflicts, distinguished in History by the name of *The Punic Wars*. The first Punic war lasted twenty-four years; the second, seventeen years; and the third, four years and some months. In this last contest, the ploughshare of destruction was literally driven through their devoted city, by the Romans. It was delivered up to be plundered by their soldiers; its gold, silver, statues, and other treasures amounting to 4,470,000 pounds weight of silver, were carried off to Rome; its towers, ramparts, walls, and all the works which the Carthaginians had raised in the course of many ages, were levelled to the ground. Fire was set to the edifices of this proud metropolis, which consumed them all, not a single house escaping the fury of the flames. And though the fire began in all quarters at the same time, and burned with incredible violence, it continued for *seventeen* days before all the buildings were consumed.—Thus perished Carthage—a city which contained 700,000 inhabitants, and which had waged so many ferocious wars with neighbouring nations—a terrible example of the destructive effects produced

by malevolent passions, and of the retributive justice of the Governor of the world. The destruction of human life in the numerous wars in which it was engaged, is beyond all specific calculation. During the space of sixteen years, Hannibal, the Carthaginian general, plundered no less than four hundred towns, and destroyed 300,000 of his enemies; and we may safely reckon, that nearly an equal number of his own men must have been cut off by the opposing armies; so that several millions of human victims must have been sacrificed in these bloody and cruel wars.

The following is a summary statement of the number of human beings that were slain in several of the battles recorded in history.—In the year 101 before Christ, in an engagement between Marius, the Roman Consul, and the Ambrones and the Teutones, in Transalpine Gaul, there were slain of these barbarians, besides what fell in the Roman army, 200,000, some historians say, 290,000. And it is related, that the inhabitants of the neighbouring country made fences for vineyards of their bones. In the following year, the Romans, under the command of the same general, slaughtered 140,000 of the Cimbri, and took 60,000 prisoners. In the year 105, B. C. the Romans, in a single engagement with the Cimbri and the Teutones, lost upwards of 80,000 men. In the battle of Cannæ, the Romans were surrounded by the forces of Hannibal, and cut to pieces. After an engagement of only three hours, the carnage became so dreadful, that even the Carthaginian general cried out, to spare the conquered. Above 40,000 Romans lay dead on the field, and six thousand of the Carthaginian army. What a dreadful display of the rage and fury of diabolical passions must have been exhibited on this occasion! and what a horrible scene must have been presented on the field of battle, when we consider, that, in the mode of ancient warfare, the slain were literally mangled, and cut to pieces!—In the battle of Issus, between Alexander and Darius, were slain 110,000; in the battle of Arbela, two years afterwards, between the same two despots, 300,000; in the battle between Pyrrhus and the Romans, 25,000; in the battle between Scipio and Asdrubal, 40,000; in the battle between Suetonius and Boadicea, 80,000. In the siege of Jerusalem by Vespasian, according to the account of Josephus, there were destroyed, in the most terrible manner, 1,100,000; and there were slaughtered in Jerusalem, in 170, B. C. by Antiochus, 40,000. At Cyrene, there were slain of Romans and Greeks, by the Jews, 220,000; in Egypt and Cyprus, in the reign of Trajan, 240,000; and in the reign of Adrian, 580,000 Jews. After Julius Cæsar had carried his arms into the territories of Usipetes in Germany, he defeated them with such slaughter, that 400,000 are said to have perished in one battle. At the defeat of Attila, King of

the Huns, at Chalons, there perished about 300,000. In the year 631, there were slain by the Saracens in Syria, 60,000; in the invasion of Milan by the Goths, no less than 300,000; and in A. D. 734, by the Saracens in Spain, 370,000. In the battle of Fontenoy, were slaughtered 100,000; in the battle of Yermouk, 150,000; and in the battle between Charles Martel and the Mahometans, 350,000. In the battle of Muret, in A. D. 1213, between the Catholics and the Albigenses, were slain 32,000; in the battle of Cressy, in 1346, 50,000; in the battle of Halidon-hill, in 1333, 20,000; in the battle of Agincourt, in 1415, 20,000; in the battle of Towton, in 1461, 37,000; in the battle of Lepanto, in 1571, 25,000; at the siege of Vienna, in 1683, 70,000; and in a battle in Persia, in 1734, 60,000.\*

The most numerous army of which we have any account in the annals of history, was that of Xerxes. According to the statement of Rollin, which is founded on the statements of Herodotus, Isocrates, and Plutarch, this army consisted of 1,700,000 foot, 80,000 horse, and 20,000 men for conducting the carriages and camels. On passing the Hellespont, an addition was made to it from other nations, of 300,000, which made his land forces amount to 2,100,000. His fleet consisted of 1207 vessels, each carrying 230 men; in all 277,610 men, which was augmented by the European nations, with 1200 vessels carrying 240,000 men. Besides this fleet the small galleys, transport ships, &c. amounted to 3000, containing about 240,000 men. Including servants, eunuchs, women, sutlers, and others, who usually follow an army, it is reckoned, that the whole number of souls that followed Xerxes into Greece, amounted to 5,283,220; which is more than the whole of the male population of Great Britain and Ireland, above twenty years of age, and nearly triple the whole population of Scotland. After remaining some time in Greece, nearly the whole of this immense army, along with the fleet, was routed and destroyed. Mardonius, one of his ablest commanders, with an army of 300,000, was finally defeated and slain at the battle of Platea, and only three thousand of this vast army, with difficulty escaped destruction.

The destruction of human life in the wars which accompanied and followed the incursions of the barbarians, who overthrew the Roman empire, is beyond all calculation or conception. It forms an era in history most degrading to the human species. In the war which was waged in Africa, in the days of Justinian, Procopius remarks, "It is no exaggeration to say, that five

\* The above statements are collected from the facts stated in Rollin's Ancient History, Millet's Elements, Mavor's Universal History, the historical Articles in the Encyclopedia Britannica, from a list of battles contained in the "Pictures of War," &c.

millions perished by the sword, and famine, and pestilence." The same author states that, during the twenty years' war which Justinian carried on with the Gothic conquerors of Italy, the loss of the Goths amounted to above 15 millions; nor will this appear incredible, when we find, that in one campaign, 50,000 labourers died of hunger. About the beginning of the 13th century arose that cruel and bloody tyrant Jenghiz-Khan. With immense armies, some of them amounting to more than a million in number, he overran and subdued the kingdom of Hya in China, Tangut, Kitay, Turkestan, Karazum, Great Buckaria, Persia, and part of India, committing the most dreadful cruelties and devastations. It is computed, that, during the last 22 years of his reign, no fewer than 14,470,000 persons were butchered by this scourge of the human race. He appeared like an infernal fiend, breathing destruction to the nations of the East, and the principle which he adopted, after conquest, was *utter extermination*.

Nearly about the same period when this monster was ravaging and slaughtering the eastern world, those mad expeditions, distinguished by the name of the *Crusades*, were going forward in the west. Six millions of infatuated wretches, raging with hatred, and thirsting for blood, assumed the image of the cross, and marched in wild disorder to the confines of the Holy land, in order to recover the city of Jerusalem from the hands of the infidels. In these *holy wars*, as they were impiously termed, more than 850,000 Europeans were sacrificed before they obtained possession of Nice, Antioch, and Edessa. At the siege of Acre, 300,000 were slain; and at the taking of Jerusalem, in 1099, about seventy thousand. For 198 years, these wild expeditions continued in vogue, and were urged forward by proclamations issued from the throne, and by fanatical sermons thundered from the pulpit, till several millions of deluded mortals perished from the earth; for by far the greater part of those who engaged in the crusades, were either slain or taken prisoners. About this period, and several centuries before it, the whole earth exhibited little else than one great field of battle, in which nations were dashing against each other, conquerors ravaging kingdoms, tyrants exercising the most horrid cruelties; superstition and revenge immolating their millions of victims; and tumults, insurrections, slaughter, and universal alarm, banishing peace and tranquillity from the world, and subverting the moral order of society. "In Europe, Germany and Italy were distracted by incessant contests between the pope and the emperors; the interior of every European kingdom was torn in pieces by the contending ambition of the powerful barons; in the Mahomedan empire, the caliphs, sultans, emirs, &c. waged continual war; new sovereignties were daily arising, and daily de-

stroyed; and amidst this universal slaughter and devastation, the whole earth seemed in danger of being laid waste, and the human race to suffer a total annihilation."<sup>\*</sup>

Such is the bird's eye view of the destruction of the human species, which war has produced in different periods. The instances I have brought forward present only a few detached circumstances in the annals of warfare, and relate only to a few limited periods in the history of man: and yet in the four instances above stated, we are presented with a scene of horror, which includes the destruction of nearly 50 millions of human beings. What a vast and horrific picture, then, would be presented to the eye, could we take in at one view *all the scenes* of slaughter, which have been realized in every period, in every nation, and among every tribe! If we take into consideration not only the number of those who have fallen in the field of battle, but of those who have perished through the natural consequences of war, by the famine and the pestilence, which war has produced; by disease, fatigue, terror, and melancholy; and by the oppression, injustice, and cruelty of savage conquerors,—it will not, perhaps, be overrating the destruction of human life, if we affirm, that *one tenth* of the human race has been destroyed by the ravages of war. And if this estimate be admitted, it will follow, that more than *fourteen thousand millions* of human beings have been slaughtered in war, since the beginning of the world—which is about *eighteen times* the number of inhabitants which, at the present, exist on the globe; or, in other words, it is equivalent to the destruction of the inhabitants of eighteen worlds of the same population as ours.† That this conclusion is rather within than beyond the bounds of truth, will appear, from what has been stated above respecting the destruction of the Goths, in the time of Justinian. In the course of 20 years, 15 millions of persons perished in the wars. Now, if the population of the countries of Europe, in which these wars took place, did not exceed 60 millions, the proportion of the slaughtered to the whole population was as *one to four*, and, if 20 years be reckoned as only half the period of a generation, the proportion was as *one to two*; in other words, at the rate of one half of a whole generation in the course of 40 years. What a horrible and tremendous consideration?—to reflect, that 14,000,000,000 of beings, endowed with intellectual faculties, and furnished with bodies curiously organized by divine wisdom—that the inhabitants of eighteen worlds should have been massacred, mangled, and cut to pieces, by those

\* Mavor's Universal History, Robertson's Charles V. &c.

† This calculation proceeds on the ground, that 145 thousand millions of men have existed since the Mosaic creation. See Christian philosopher, Art Geography.

who were partakers of the same common nature, as if they had been created merely for the work of destruction! Language is destitute of words sufficiently strong to express the emotions of the mind, when it seriously contemplates the horrible scene. And how melancholy is it to reflect, that in the present age, which boasts of its improvements in science, in civilization, and in religion, neither reason, nor benevolence, nor humanity, nor Christianity, has yet availed to arrest the progress of destroying armies, and to set a mark of ignominy on "the people who delight in war!"

## ATROCITIES CONNECTED WITH WAR.

However numerous may have been the victims that have been sacrificed in war, it is not so much the mere extinction of human life that renders the scene of warfare so horrible, as the cruelties with which it has always been accompanied, and the infernal passions which it has engendered and carried into operation. It extirpates every principle of compassion, humanity, and justice; it blunts the feelings, and hardens the heart; it invents instruments of torture, and perpetrates, without a blush, cruelties revolting to every principle of virtue and benevolence.

When Jerusalem was taken by Antiochus Epiphanes, in the year 168, B. C. he gave orders to one division of his army to cut in pieces all who were found in the temple and synagogues; while another party, going through the streets of the city, massacred all that came in their way. He next ordered the city to be plundered and set on fire; pulled down all their stately buildings, caused the walls to be demolished, and carried away captive ten thousand of those who had escaped the slaughter. He set up the statue of Jupiter Olympus on the altar of burnt-offerings, and all who refused to come and worship this idol were either massacred, or put to some cruel tortures, till they either complied or expired under the hands of the executioners. In the war which the Carthaginians waged with the Mercenaries, Hamilcar, the Carthaginian general, threw all the prisoners that fell into his hands to be devoured by wild beasts. Asdrubal, another Carthaginian general, when engaged in war against the Romans, in revenge for a defeat he had sustained, brought all the Roman prisoners he had taken during two years, upon the walls, in the sight of the whole Roman army. There he put them to the most exquisite tortures, putting out their eyes, cutting off their noses, ears, and fingers, legs and arms, tearing their skin to pieces with iron rakes or harrows; and then threw them headlong from the top of the battlements.\* He was of a temper remarkably inhuman, and it is said that he even took pleasure in seeing some of these unhappy men flayed alive.—In the year 1201, when Jeng-

hiz-Khan had reduced the rebels who had seized upon his paternal possessions, as a specimen of his lenity, he caused seventy of their chiefs to be thrown into as many cauldrons of boiling water. The plan on which this tyrant conducted his expeditions, as already stated, was that of total extermination. For some time he utterly extirpated the inhabitants of those places which he conquered, designing to people them anew with his Moguls; and, in consequence of this resolution, he would employ his army in beheading 100,000 prisoners at once.—Tamerlane, one of his successors, who followed in his footsteps, is said to have been more humane than this cruel despot. Historians inform us that "his sportive cruelty seldom went farther than the pounding of three or four thousand people in large mortars, or building them among bricks and mortar into a wall." If such be the "tender mercies of the wicked," how dreadful beyond description must their cruelties be!

We are accustomed to hear Alexander the Great eulogized as a virtuous and magnanimous hero; and even the celebrated Montesquieu, in his "Spirit of Laws," has written a panegyric on his character. Yet we find him guilty of the most abominable vices, and perpetrating the most atrocious crimes. At the instigation of the strumpet Thais, during a drunken banquet, he set on fire the beautiful city of Persepolis, and consumed it to ashes. Chitus, one of his captains, and brother of Helenice who had nursed Alexander, and saved his life at the battle of the Granicus, at the imminent danger of his own. Yet this man, to whom he was so highly indebted, he thrust through with a javelin, at an entertainment to which he had invited him; on account of his uttering some strong expressions, which were intended to moderate Alexander's vanity. His treatment of the Branchidae furnishes an example of the most brutal and frantic cruelty which history records. These people received Alexander, while pursuing his conquests, with the highest demonstrations of joy, and surrendered to him, both themselves and their city. The next day, he commanded his phalanx to surround the city, and, a signal being given, they were ordered to plunder it, and to put every one of its inhabitants to the sword, which inhuman order was executed with the same barbarity with which it had been given. All the citizens, at the very time they were going to pay homage to Alexander, were murdered in the streets and in their houses; no manner of regard being had to their cries and tears, nor the least distinction made of age or sex. They even pulled up the very foundations of the walls, in order that not the least traces of that city might remain. And why were these ill-fated citizens punished in so summary and inhuman a manner? Merely because their forefathers, upwards of one hundred and fifty years before, had

\* Rollin's Ancient History, Vol. I

delivered up to Xerxes the treasure of the temple of Didymæon, with which they had been intrusted! \*—When he entered the city of Tyre, after a siege of seven months, he gave orders to kill all the inhabitants, except those who had fled to the temples, and set fire to every part of the city. Eight thousand men were barbarously slaughtered; and two thousand more remaining, after the soldiers had been glutted with slaughter, he fixed two thousand crosses along the seashore,† and caused them all to be crucified.

War has given rise to the most shocking and unnatural crimes, the idea of which might never otherwise have entered into the human mind. Lathyrus, after an engagement with Alexander, king of the Jews, on the banks of the river Jordan,—the same evening he gained the battle, in going to take up his quarters in the neighbouring villages, he found them full of women and children, and caused them all to be put to the sword, and their bodies to be cut to pieces, and put into cauldrons in order to their being dressed, as if he intended to make his army sup upon them. His design was to have it believed, that his troops ate human flesh, to spread the greater terror throughout the surrounding country.‡

Even under the pretext of religion, and of the Christian religion too, the most shocking barbarities have been committed. Under the pretence of vindicating the cause of Him who, in the midst of cruel sufferings from men, prayed, "Father, forgive them, for they know not what they do," the crusaders hurried forward towards Jerusalem, wading through seas of blood. When their banners were hoisted on a principal eminence of Antioch, they commenced their butchery of the sleeping inhabitants. The dignity of age, the helplessness of youth, and the beauty of the weaker sex, were disregarded by these sanctimonious savages. Houses were no sanctuaries; and the sight of a mosque added new virulence to cruelty. The number of Turks massacred, on this night of frantic fury, was at least ten thousand. After every species of habitation, from the marble palace to the meanest hovel, had been converted into a scene of slaughter; when the narrow streets and the spacious squares were all alike disfigured with human gore, and crowded with mangled carcasses, then the assassins turned robbers, and became as mercenary as they had been merciless. When Jerusalem was taken by these furious fanatics, they suffered none to escape the slaughter: "Yet, after they had glutted themselves with blood and carnage, they immediately became devout pilgrims, and in religious transports, ran barefooted to visit the holy sepulchre."§ In what light must that religion appear to Eastern Infidels which is supposed to lead to the perpetration of

such enormities? And how wofully are the mild precepts and doctrines of Christianity misrepresented, when desperadoes of this description dare assume the Christian name!

Even the finer feelings of the female sex have been blunted, and, in many instances, quite extirpated by the mad schemes of ambition, and the practices connected with war. Towards the beginning of the thirteenth century, a Queen of Hungary took the sign of the cross, and embarked in the mad expeditions of the crusaders, as did likewise fifty thousand children and a crowd of priests; because, according to the Scripture, "God has made children the instruments of his glory."||—Cleopatra, daughter of Ptolemy Philometer, in order to gratify her restless ambition of reigning alone and uncontrolled in her dominions, killed her son Seleucus, with her own hand, by plunging a dagger into his breast. She had been the wife of three Kings of Syria and the mother of four, and had occasioned the death of two of her husbands. She prepared a poisoned draught to destroy Grypus another of her sons; but her intention having been suspected, she was compelled to swallow the deadly potion she had prepared, which took immediate effect, and delivered the world from this female monster. The Carthaginians were in the practice of offering human sacrifices to their god Saturn, when they were defeated in war, in order to propitiate the wrath of this deity. At first, children were inhumanly burned, either in a fiery furnace, like those in the valley of Hinnom, so frequently mentioned in Scripture, or in a flaming statue of Saturn.—The cries of these unhappy victims were drowned by the uninterrupted noise of drums and trumpets. Mothers made it a merit, and a part of their religion, to view the barbarous spectacle with dry eyes, and without so much as a groan; and if a tear or sigh stole from them, the sacrifice was considered as less acceptable to the deity. This savage disposition was carried to such excess, that even mothers would endeavour, with embraces and kisses to hush the cries of their children, lest they should anger the god.¶ When Carthage was taken by the Romans, the wife of Andrubal, the Carthaginian general, who had submitted to the Romans, mounted to the upper part of one of the temples which had been set on fire; and, placing herself, with her two children, in sight of her husband, uttered the most bitter imprecations against him. "Base coward (said she) the mean things thou hast done to save thy life shall not avail thee; thou shalt die this instant, at least in thy two children." Having thus spoken, she stabbed both the infants with a dagger, and while they were yet struggling for life, threw them both from the top of the temple, and then leaped down after them into the flames! \*\*

|| Millot's Elem. ¶ Rollin's An. Hist.  
\*\* Ency. Brit. Art. Carthage.

Such are only a few insulated pictures of the atrocities of war, and of the unnatural and infernal passions which uniformly follow in its train, which may be considered as specimens of many thousands of similar instances, which the records of history furnish of the malignity and depravity of mankind. I have selected my examples chiefly from the history of ancient warfare: but were we to search the annals of *modern* warfare, and confine our attention solely to the battles of Alexandria, of the Pyramids, of Borodina, of Smolensko, of Austerlitz, of Leipsic, of Jena, of Eylau, of Waterloo, and other warlike events which have happened within the last thirty years, we should meet with atrocities and scenes of slaughter, no less horrible than those which I have now related. I shall content myself with stating only two or three instances.

After the taking of Alexandria by Bonaparte, "We were under the necessity," says the relator, "of putting the whole of them to death at the breach. But the slaughter did not cease with the resistance. The Turks and inhabitants fled to their mosques, seeking protection from God and their prophet; and then, *men and women, old and young, and infants at the breast, were slaughtered.* This butchery continued for *four hours*; after which the remaining part of the inhabitants were much astonished at not having their throats cut." Be it remembered that all this bloodshed was premeditated. "We might have spared the men whom we lost," says General Boyer, "by only summoning the town; but it was necessary to begin by confounding our enemy."\* After the battle of the Pyramids, it is remarked by an eye-witness, that "the whole way through the desert, was tracked with the bones and bodies of men and animals who had perished in these dreadful wastes.—In order to warm themselves at night, they gathered together the dry bones and bodies of the dead, which the vultures had spared, and it was by a *fire composed of this fuel that Bonaparte lay down to sleep in the desert.*"† A more revolting and infernal scene it is scarcely possible for the imagination to depict.

Miot gives the following description in relation to a scene at Jaffa:—"The soldier abandons himself to all the fury which an assault authorizes. He strikes, he slays, nothing can impede him. All the horrors which accompany the capture of a town by storm, are repeated in every street, in every house. You hear the cries of violated females calling in vain for help to those relatives whom they are butchering. No asylum is respected. The blood streams on every side; at every step you meet with human beings groaning and expiring," &c.—Sir Robert Wilson, when describing the campaigns in Poland relates, that "the ground between the wood.

and the Russian batteries, about a quarter of mile, was a *sheet of naked human bodies*, which friends and foes had during the night mutually stripped, not leaving the worst rag upon them, although numbers of these bodies still retained consciousness of their situation. It was a sight which the eye loathed, but from which it could not remove."—In Labaume's "Narrative of the Campaign in Russia," we are presented with the most horrible details of palaces, churches, and streets, enveloped in flames,—houses tumbling into ruins,—hundreds of blackened carcasses of the wretched inhabitants, whom the fire had consumed, blended with the fragments,—hospitals containing 20,000 wounded Russians on fire, and consuming the miserable victims,—numbers of half-burned wretches crawling among the smoking ruins,—females violated and massacred,—parents and children half naked, shivering with cold, flying in consternation with the wrecks of their half-consumed furniture,—horses falling in thousands, and writhing in the agonies of death,—the fragments of carriages, muskets, helmets, breast-plates, portmanteaus, and garments strewed in every direction,—roads covered for miles with thousands of the dying and the dead heaped one upon another, and swimming in blood,—and these dreadful scenes rendered still more horrific by the shrieks of young females, of mothers and children, and the piercing cries of the wounded and the dying, invoking death to put an end to their agonies.

But I will not dwell longer on such revolting details. It is probable, that the feelings of some of my readers have been harrowed up by the descriptions already given, and that they have turned away their eyes in disgust from such spectacles of depravity and horror. Every mind susceptible of virtuous emotions, and of the common feelings of humanity, must, indeed, feel pained and even agonized, when it reflects on the depravity of mankind, and on the atrocious crimes they are capable of committing, and have actually perpetrated. A serious retrospect of the moral state of the world in past ages, is calculated to excite emotions, similar to those which overpowered the mourning prophet when he exclaimed, "O that my head were waters, and mine eyes a fountain of tears, that I might weep day and night, for the slain of the daughters of my people!" But, however painful the sight, we ought not to turn away our eyes, with fastidious affectation, from the spectacles of misery and devastation which the authentic records of history present before us. They form traits in the character of man, which ought to be contemplated,—they are *facts* in the history of mankind, and not the mere pictures of fancy which are exhibited in poetry, in novels, and romances,—facts which forcibly exemplify the operations of the malevolent principle, and from which we ought to deduce important instructions, in reference

\* Miot's Memoirs.

† Ibid.

to the evil of sin, and the malignancy of pride, covetousness, ambition, and revenge. We think nothing, in the common intercourse of life, of indulging a selfish disposition, of feeling proud and indignant at a real or supposed affront, of looking with a covetous eye at the possessions of our neighbours, of viewing the success and prosperity of our rivals with discontentment and jealousy, or of feeling a secret satisfaction at the distress or humiliation of our enemies; and we seldom reflect on the malignant effects which such passions and dispositions would produce, were they suffered to rage without control. But, in the scenes and contentions of warfare which have been realized on the great theatre of the world, we contemplate the nature and effects of such malignant dispositions in their true light; we perceive the ultimate tendency of every malevolent affection, when no physical obstruction impedes its progress; we discern that it is only the same dispositions which we daily indulge, operating on a more extensive scale; and we learn the necessity of mortifying such dispositions, and counteracting their influence, if we expect to enjoy substantial felicity either here or hereafter; and if we wish to see the world restored to order, to happiness and repose.

I shall only observe farther on this part of my subject, that, besides the atrocities already noticed, war has been the source of every vicious disposition, and of every immoral practice. The Carthaginians, who were almost incessantly engaged in war, were knavish, vicious, cruel, and superstitious; distinguished for craft and cunning, lying and hypocrisy, and for the basest frauds and the most perfidious actions. The Goths and Vandals are uniformly characterized, as not only barbarous and cruel, but avaricious, perfidious, and disregarding of the most solemn promises. It was ever a sufficient reason for them to make an attack, that they thought their enemies could not resist them. Their only reason for making peace, or for keeping it, was because their enemies were too strong; and their only reason for committing the most horrible massacres, rapes, and all manner of crimes, was because they had gained a victory. The Greeks and Romans, it is well known, notwithstanding their superior civilization, were distinguished for the most degrading and immoral practices. They gloried in being proud, haughty, and revengeful; and even their amusements were characterized by a spirit of ferocity, and by the barbarisms of war.—It is almost needless to say that war blunts the finer feelings of humanity, and engenders a spirit of selfishness, and of indifference even towards friends and companions. Of this many shocking instances could be given.

Miot in his *Memoirs of the War in Egypt*, relates the case of a soldier who was seized with the plague, and with the delirium which sometimes accompanies the disease. He took up his

knapsack, upon which his head was resting, and placing it upon his shoulders, made an effort to rise, and to follow the army. The venom of the dreadful malady deprived him of strength, and after three steps, he fell again upon the sand, headlong. The fall increased his terror of being left by the regiment, and he rose a second time, but with no better fortune. In his third effort, he sunk, and, falling near the sea, remained upon that spot which fate had destined for his grave. The sight of this soldier was frightful: the disorder which reigned in his senseless speech—his figure, which represented whatever is mournful—his eyes staring and fixed—his clothes in rags—presented whatever is most hideous in death. The reader may perhaps believe that his comrades would be concerned for him; that they would stop to help him; that they would hasten to support him, and direct his tottering steps. Far from it: the poor wretch was only an object of horror and derision. They ran from him, and they burst into loud laughter at his motions, which resembled those of a drunken man, "He has got his account," cried one; "He will not march far," said another; and, when the wretch fell for the last time, some of them added, "See, he has taken up his quarters!" This terrible truth, says the narrator, which I cannot help repeating, must be acknowledged—*Indifference and selfishness are the predominant feelings of an army.*

Rocca, in his "*Memoirs of the War in Spain*," remarks, "The habit of danger made us look upon death as one of the most ordinary circumstances of life; when our comrades had once ceased to live, the indifference which was shown them amounted almost to irony. When the soldiers, as they passed by, recognised one of their companions stretched among the dead, they just said, 'He is in want of nothing, he will not have his horse to abuse again, he has got drunk for the last time,' or something similar, which only worked, in the speaker, a stoical contempt of existence. Such were the funeral orations pronounced in honour of those who fell in our battles."—Simpson, in his "*Visit to Flanders*," in 1815, remarks, "Nothing is more frightful than the want of feeling which characterizes the French soldiery. Their prisoners who were lying wounded in the hospitals of Antwerp, were often seen *mimicking the contortions of countenance which were produced by the agonies of death, in one of their own comrades in the next bed.* There is no man to be compared with the power of fiends *like these.*"

Thus, it appears, that wars have prevailed in every period, during the ages that are past, and have almost extirpated the principle of benevolence from the world; and, therefore, it is obvious, that, before the prevailing propensity to warfare be counteracted and destroyed, the happiness which flows from the operation of the benevolent affec-

None cannot be enjoyed by mankind at large. To counteract this irrational and most deplorable propensity, by every energetic mean which reason, humanity, and Christianity can suggest, must be the duty of every one who is desirous to promote the present and everlasting happiness of his species.\*

## SECTION II.

### STATE OF MORALS IN MODERN TIMES.

#### *Moral state of Savage Nations.*

I shall now take a very brief survey of the state of morals in modern times, and of the prevailing dispositions which are displayed by the existing inhabitants of our globe. Were I to enter into those minute and circumstantial details which the illustration of this subject would require, several volumes would be filled with the detail of facts, and with the sketches of moral scenery which might be brought forward. And such a work, if judiciously executed, might be rendered highly interesting, and might produce a variety of benignant effects both on Christian and on general society. But the narrow limits within which the present work must be comprised, compels me to confine my attention to a few prominent features in the characters of mankind, and, to a few insulated facts by which they may be illustrated.—I shall consider, in the first place, some of the

#### *Prominent dispositions which appear among Savage and Half Civilized Nations.*

It is not to be disputed, that numerous individuals among the uncivilized tribes of mankind, have occasionally displayed the exercise of many of the social virtues,—that they have been brave and magnanimous, faithful to their promises, strong in their attachments, and generous and affectionate to their friends and relatives. But their virtues, for the most part, proceed from a principle of selfishness, and are confined to the clan or tribe to which they belong. Towards their enemies, and towards all who have injured them in the slightest degree, they almost uniformly display cruel, perfidious, and revengeful dispositions. The following facts and descriptions, selected from the authentic records of voyagers and travellers, will tend to corroborate these positions.

The most prominent feature which appears in

\* The Author intended, had his limits permitted, to state some additional considerations to show the folly and wickedness of war. In the mean time, he refers his readers to "Letters addressed to Caleb Strong, Esq.," which contain a series of energetic and impressive reasonings on the subject.—"Pictures of War," by Irenicus, and a duodecimo volume, lately published, entitled, "An Inquiry into the accordancy of War with the principles of Christianity," &c.

the character of savage nations, is, their disposition for war, and to inflict revenge for real or supposed injuries. With respect to the NORTH AMERICAN Indians, it is the uniform description given of them by all travellers, that, if we except hunting, war is the only employment of the men, and every other concern is left to the women. Their most common motive for entering into war, is, either to revenge themselves for the death of some lost friends, or to acquire prisoners, who may assist them in their hunting, and whom they adopt into their society. In these wars, they are cruel and savage, to an incredible degree. They enter unawares, the villages of their foes, and, while the flower of the nation are engaged in hunting, massacre all the children, women, and helpless old men, or make prisoners of as many as they can manage. But when the enemy is apprized of their design, and coming on in arms against them, they throw themselves flat on the ground, among the withered herbs and leaves, which their faces are painted to resemble. They then allow a part to pass unmolested; when, all at once, with a tremendous shout, rising up from their ambush, they pour a storm of musket-balls on their foes. If the force on each side continues nearly equal, the fierce spirits of these savages, inflamed by the loss of friends, can no longer be restrained. They abandon their distant war, they rush upon one another with clubs and hatchets in their hands, magnifying their own courage, and insulting their enemies. A cruel combat ensues; death appears in a thousand hideous forms, which would congeal the blood of civilized nations to behold, but which rouse the fury of these savages. They trample, they insult over the dead bodies, tearing the scalp from the head, wallowing in their blood like wild beasts, and sometimes devouring their flesh. The flame rages on till it meets with no resistance; then the prisoners are secured, whose fate is a thousand times more dreadful than theirs who have died in the field. The conquerors setup a hideous howling, to lament the friends they have lost. They approach to their own village; the women, with frightful shrieks, come out to mourn their dead brothers, or their husbands. An orator proclaims aloud a circumstantial account of every particular of the expedition; and as he mentions the names of those who have fallen, the shrieks of the women are redoubled. The last ceremony is the proclamation of victory: each individual then forgets his private misfortune, and joins in the triumph of his nation; all tears are wiped from their eyes, and, by an unaccountable transition, they pass in a moment from the bitterness of sorrow, to an extravagance of joy.\*

As they feel nothing but revenge for the enemies of their nation, their prisoners are treated with cruelty in the extreme. The cruelties in-

\* See Ency. Brit. Art. America.

flicted on those prisoners who are doomed to death, are too shocking and horrible to be exhibited in detail: one plucks out the nails of the prisoner by the roots; another takes a finger into his mouth, and tears off the flesh with his teeth; a third thrusts the finger, mangled as it is, into the bowl of a pipe made red hot, which he smokes like tobacco: they then pound his toes and fingers to pieces between two stones; they apply red hot irons to every part of his mangled body; they pull off his flesh, thus mangled and roasted, and devour it with greediness;—and thus they continue for several hours, and sometimes for a whole day, till they penetrate to the vital parts, and completely exhaust the springs of life. Even the women, forgetting the human, as well as the female nature, and transformed into something worse than furies, frequently outdo the men in this scene of horror; while the principal persons of the country sit round the stake to which the prisoner is fixed, smoking, and looking on without the least emotion. What is most remarkable, the prisoner himself endeavours to brave his torments with a stoical apathy. “I do not fear death, (he exclaims in the face of his tormentors,) nor any kind of tortures; those that fear them are cowards, they are less than women. May my enemies be confounded with despair and rage! Oh, that I could devour them, and drink their blood to the last drop!”

Such is a faint picture of the ferocious disposition of the Indians of America, which, with a few slight modifications, will apply to almost the whole of the original natives of that vast continent. Instead of the exercise of benevolent affections, and of forgiving dispositions; instead of humane feelings, and compassion for the sufferings of fellow-mortals, we here behold them transported into an *extravagance of joy*, over the sufferings they had produced, the carnage they had created, the children whom they had deprived of their parents, and the widows whose husbands they had mangled and slain; because they had glutted their revenge, and obtained a victory. Nothing can appear more directly opposed to the precepts of Christ, and to the benevolence of heaven.

If, from America, we cross the Atlantic, and land on the shores of AFRICA, we shall find the existing inhabitants of that continent displaying dispositions no less cruel and ferocious.—Boeman relates the following instances of cruelties practised by the Adomese Negroes, inhabiting the banks of the Praa or Chamah river.

“Anqua, the king, having in an engagement taken five of his principal Antese enemies prisoners, he wounded them all over; after which, with a more than brutal fury, he satiated, though not tired himself, by sucking their blood at the gaping wounds; but, bearing a more than ordinary grudge against one of them, he caused him to be laid bound at his feet, and his body to be

pierced with hot irons, gathering his blood thus issued from him in a vessel, one half of which he drank, and offered up the rest to his god. On another occasion, he put to death one of his wives and a slave, drinking their blood also, as was his usual practice with his enemies.”\*—Dispositions and practices no less abominable, are regularly exhibited in the kingdom of Dahomy, near the Gulf of Guinea. An immolation of human victims, for the purpose of watering the graves of the king’s ancestors, and of supplying them with servants of various descriptions in the other world, takes place every year, at a grand festival which is held generally in April and May, about the period, possibly, when the Bible and Missionary Societies of this country are holding their anniversaries. The victims are generally prisoners of war, reserved for the purpose; but, should there be lack of these, the number (between sixty and seventy) is made up from the most convenient of his own subjects. The immolation of victims is not confined to this particular period; for at any time, should it be necessary to send an account to his forefathers of any remarkable event, the king despatches a courier to the shades, by delivering a message to whoever may happen to be near him, and then ordering his head to be chopped off immediately. It is considered an honour where his majesty personally condescends to become the executioner in these cases; an office in which the king prides himself in being expert. The governor was present on one occasion, when a poor fellow, whose fear of death outweighing the sense of the honour conferred upon him, on being desired to carry some message to his father, humbly declared on his knees, that he was unacquainted with the way. On which the tyrant vociferated, “I’ll show you the way,” and, with one blow, made his head fly many yards from his body, highly indignant that there should have been the least expression of reluctance.† On the thatched roofs of the guard-houses which surround the palace of this tyrant, are ranged, on wooden stakes, numbers of human skulls; the top of the wall which encloses an area before it, is stuck full of human jaw-bones, and the path leading to the door is paved with the skulls.

In the kingdom of ASHANTEE, similar practices uniformly prevail. “When the king of this country (says Dupuis) was about to open the campaign in Gaman, he collected together his priests, to invoke the royal Fetichs, and perform the necessary orgies to ensure success. These ministers of superstition sacrificed thirty-two male, and eighteen female victims as an expiatory offering to the gods; but the answers from the priests being deemed by the council as still devoid of inspiration, the king was induced to *make a custom*, at the sepulchres of his ancestors, where many hundreds bled. This, it is af-

\* Dupuis’ Journal in Ashantee.  
† M’Leod’s voyage to Africa.

“rased, propitiated the wrath of the adverse god.” The same king, when he returned, having discovered a conspiracy, decreed, that seventeen of his wives, along with his own sister, should be strangled and beheaded. “His sister’s paramour, and all those of his party, were doomed to the most cruel deaths, at the grave of the king’s mother. While these butcheries were transacting, the king prepared to enter the palace; and in the act of crossing the threshold of the outer gate, was met by several of his wives, whose anxiety to embrace their sovereign lord impelled them thus to overstep the boundary of female decorum in Ashantee; for it happened that the king was accompanied by a number of his captains, who, accordingly, were compelled to cover their faces with both their hands, and fly from the spot. This is said to have angered the monarch, although his resentment proceeded no farther than words, and he returned the embraces of his wives. But another cause of anger soon after occurred, and he was inflamed to the highest pitch of indignation, and, in a paroxysm of anger, caused these unhappy beings to be cut in pieces before his face, giving orders, at the same time, to cast the fragments into the forest, to be devoured by birds and beasts of prey. Nor did the atonement rest here; for six more unhappy females were impeached of inconstancy, and they also expiated their faults with their lives. Like another Ulysses, his majesty then devoted himself to the purification of his palace, when, to sum up the full horrors of these bloody deeds, two thousand wretches, selected from the Gaman prisoners of war, were slaughtered over the royal death-stool, in honour of the shades of departed kings and heroes.”\*

Such are a few specimens of the ferocious dispositions of the petty tyrants of Africa. But we are not to imagine, that such dispositions are confined to kings, and to the higher ranks of society. Wherever such malevolent passions are displayed among barbarous chieftains, they pervade, in a greater or less degree, the whole mass of the people, and almost every one, in proportion to the power with which he is invested, perpetrates similar barbarities. The following instance will corroborate this position, and, at the same time, show, for how many cruelties and acts of injustice the abettors of the infamous traffic in slaves, are accountable. It is extracted from Major Gray’s “Travels in Africa, in 1824.”

The Kaartan force which the Major accompanied, had made 107 prisoners, chiefly women and children, in a predatory excursion into Bondoo, for the purpose of supplying themselves with slaves. The following is an account of the manner in which they were dragged along. “The men were tied in pairs by the necks, their hands

secured behind their backs; the women by the necks only; but their hands were not left free, from any sense of feeling for them, but in order to enable them to balance the immense loads of corn or rice which they were obliged to carry on their heads, and their children on their backs.” —“I had an opportunity,” says Major Gray, “of witnessing, during this short march, the new-made slaves, and the sufferings to which they are subjected in their first state of bondage. They were hurried along (tied) at a pace little short of running, to enable them to keep up with the horsemen, who drove them on, as Smithfield drovers do fatigued bullocks. Many of the women were old, and by no means able to endure such treatment. One, in particular, would not have failed to excite the tenderest feelings of compassion in the breast of any, save a savage African. She was at least sixty years old, in the most miserable state of emaciation and debility, nearly doubled together, and with difficulty dragging her tottering limbs along. To crown the heart-rending picture, she was naked, save from her waist, to about half way to the knees. All this did not prevent her inhuman captor from making her carry a heavy load of water, while, with a rope about her neck, he drove her before his horse; and whenever she showed the least inclination to stop, he beat her in the most unmerciful manner with a stick.”

Were we to travel through the whole interior of Africa, and round its northern, eastern, and western coasts, we should find, among almost every tribe, numerous displays of the most inhuman and depraved dispositions. The *Algerines* are characterized as the most cruel and dangerous pirates—base, perfidious, and rapacious, to the last degree. No oaths, nor ties, human or divine, will avail to bind them, when their interest interferes. Whatever respect they may pretend to pay to their prophet Mahomet, gold is the only true idol which they worship. The emperors of Morocco are well known as a set of rapacious and blood-thirsty tyrants, who have lived in a state of habitual warfare with Christian nations, and in the perpetration of deeds of injustice and cruelty. The *Gallas*, on the borders of Abyssinia, are a barbarous and warlike nation. They are hardy, and of a ferocious disposition; they are trained to the love of desperate achievements, taught to believe that conquest entitles them to the possession of whatever they desire, and to look upon death with the utmost contempt; and, therefore, in their wars, they fight with the most desperate resolution, and neither give nor take any quarter. The inhabitants of *Azel*, too, are of a warlike disposition, and most frequently live in enmity and hostility with those around them. The *Falops* are gloomy and unforgiving in their tempers, thirsting for vengeance even in the hour of dissolution, and leaving their children to avenge their quarrels. The inhabitants of the *Grains*

\* Dupuis’ Mission to Ashantee, in 1828

*Coast*, especially the Mulattoes, are said to be a most abandoned set of people. The men are drunkards, lewd, thievish, and treacherous, and the women are the most abandoned prostitutes, sacrificing themselves at all times, and to all sorts of men, without the least degree of restraint.\* The natives of *Ansoe*, which borders on Angola, live by plundering all who happen to fall in their way, some of whom they kill, and others they keep as slaves.† “The *Booshemen* are land pirates, who live without laws and without discipline; who lurk in thickets, to watch the passage of travellers, and shoot them with poisoned arrows, in order to seize their cattle.”‡ “The negroes of Congo, (says M. de la Brosse in his *Travels along the coast of Angola*, in 1738,) are extremely treacherous and vindictive. They daily demanded of us some brandy for the use of the king and the chief men of the town. One day this request was denied and we had soon reason to repent it; for all the English and French officers having gone to fish on a small lake near the sea-coast, they erected a tent for the purpose of dressing and eating the fishes they had caught. When amusing themselves after their repast, seven or eight negroes, who were the chiefs of Loango, arrived in sedans, and presented their hands according to the custom of the country. These negroes privately rubbed the hands of the officers with a subtle poison, which acts instantaneously; and, accordingly, five captains and three surgeons died on the spot.”

The *Moors* are characterized by Mr. Park as having cruelty and low cunning pictured on their countenances. Their treachery and malevolence are manifested in their plundering excursions against the Negro villages. Without the smallest provocation, and sometimes under the fairest professions of friendship, they will seize upon the Negroes' cattle, and even on the inhabitants themselves. The *Bedouins* are plunderers of the cultivated lands, and robbers on the high roads; they watch every opportunity of revenging their enemies, and their animosities are transmitted as an inheritance from father to children. Even the *Egyptians*, who are more civilized than the tribes to which I have now alluded, are characterized by excessive pride, vindictive tempers, inordinate passions, and various species of moral turpitude. There is a trait in the character of the women of this country, pointedly adverted to by Sonini, in his “*Travels in Egypt*,” which is particularly odious and horrible. On discovering any partiality in their husbands for other females, they are transported into an unbounded and jealous fury. Such are their deceit and cruelty on these occasions, that they instil into the blood of their faithless husband, a slow and mortal poison. Their revenge is meditated

in silence, and they indulge the diabolical satisfaction of taking off an unhappy being by a lingering death. It is said, with confidence, that their own persons supply the horrid means of perpetrating their malicious designs on their husbands, and that they mix with their aliment a certain portion of an ingredient of a poisonous nature, which infallibly induces a slow languor and consumption, and in time brings the wretched victim to the grave. The symptoms are dreadful. The body desiccates, the limbs become excessively weak, the gums rot, the teeth loosen, the hair falls off, and, at length, after having dragged a miserable and tortured existence, for a whole year or more, the unhappy beings die in the most extreme torment.

If we pass from Africa to the regions of Asia, we shall find similar depraved principles and practices pervading its several tribes, and the various ranks of its population. Here, tyranny, in all its degrading and cruel forms, reigns supreme and uncontrolled over a superstitious, a deluded, and an idolatrous race of mankind,—of which the following recent instances, in relation to a petty despot of Persia, may serve as a specimen. “The governor Zulficar Khun is pronounced to be a cruel and unprincipled tyrant; unfortunately for the people, he has the ear of the sovereign, and they have no resource against his rapacity. He pays to the crown 7000 tomans a year, but it is asserted, that he collects from the district 100,000. His oppression was so grievous, that the inhabitants, wearied out, went in a body to the king to complain; but his majesty only referred them back to their tyrant, who, exasperated at their boldness, wreaked upon them a cruel vengeance. It is said, that he maimed and put to death upwards of a thousand of both sexes, cutting off the hands, putting out the eyes, and otherwise mutilating the men, and cutting off the noses, ears, and breasts of the women. The people, desponding and brokenhearted after this, paid, in as far as they were able, the rapacious demands of their oppressor, and the natural consequence, ruin and desolation has ensued.”§

Sir John Chardin gives us the following account of the inhabitants of Mingrelia, particularly of the women. “The people are generally handsome, the men strong and well-made, and the women very beautiful; but both sexes are very vicious and debauched. The women, though lively, civil, and affectionate, are very perfidious; for there is no wickedness which they will not perpetrate, in order to procure, to preserve, or to get rid of their gallants. The men likewise possess many bad qualities. All of them are trained to robbery, which they study both as a business, and as an amusement. With great satisfaction they relate the depredations

\* Cooke's Universal Geography, Vol. I. p. 447.

‡ Vallant's Travels.

§ Frazer's Journey to Khorasan, 1823

they have committed; and, from this polluted source, they derive their greatest praise and honour. In Mingrelia, falsehood, assassination, and theft, are good actions; and whoredom, bigamy, and incest, are esteemed as virtuous habits. The men marry two or three wives at a time, and keep as many concubines as they choose. They not only make a common practice of selling their children, either for gold, or in exchange for wares and provisions, but even murder them, or bury them alive, when they find it difficult to bring them up."

The *Tartars*, who occupy vast regions of the Asiatic continent, are uniformly described by travellers, as a rude, plundering, and uncultivated race of men. "There is something frightful," says Smellie, "in the countenances of the Calmuck Tartars. All of them are wandering vagabonds, and live in tents made of cloth or of skins. They eat the flesh of horses, either raw, or a little softened by putrifying under their saddles. No marks of religion, or of decency in their manners, are to be found among most of these tribes. They are fierce, warlike, hardy, and brutally gross. They are all robbers; and the Tartars of Daghestan, who border on civilized nations, have a great trade in slaves, whom they carry off by force, and sell to the Persians and Turks."\*

The *Arabians*, like the Tartars, live mostly without government, without law, and almost without any social intercourse. They still continue in a state of rudeness and of lawless independency. Their chiefs authorize rape, theft, and robbery. They have no estimation for virtue, and glory in almost every species of vice. They roam about in the deserts, and attack caravans and travellers of every description, whom they frequently murder, and plunder of their property.—The *Chinese*, though more highly civilized than the tribes now mentioned, and though they merit great applause for their ingenuity, industry, and perseverance, are as despicable in their moral characters, and as destitute of true benevolence, as almost any nation upon earth. Avarice is their leading passion; and in order to gratify it, they practise every species of duplicity and fraud. They cannot be influenced by motives either of honesty or of humanity; and they surpass every nation on the globe in private cheating. Captain Cook observes, that (the danger of being hanged for any crime being excepted) "there is nothing, however infamous, which the Chinese will refuse to do for gain." In this opinion he concurs with every preceding and subsequent writer, and confirms it by a variety of striking proofs, of which an additional number may be seen in the accounts which have been published of our late embassies to that empire.

\* Smellie's Philosophy of Natural History.

The *Birmans* are a lively inquisitive race, active, irascible, and impatient. While in peace, they give proofs of a certain degree of gentleness and civilization; in war, they display the ferocity of savages.—The *Malays*, though inhabiting a country beautiful and delightful in the extreme, where refreshing gales and cooling streams assuage the heat, where the soil teems with delicious fruits, where the trees are clothed with a continual verdure, and the flowers breathe their fragrant odours, are remarkably ferocious in their manners. They go always armed (except the slaves,) and would think themselves disgraced, if they went abroad without their poignards. The inland inhabitants of Malacca, called *Monacaboes*, are a barbarous savage people, delighting in doing continual mischief to their neighbours; on which account, no grain is sown about Malacca, but what is enclosed in gardens, with the thickest hedges, or deep ditches; for when the grain is ripe in the open plains, the *Monacaboes* never fail to set fire to it. The *Persians*, in their dispositions, says Mr. Franklin, are much inclined to sudden anger, are quick, fiery, and very sensible of affronts, which they resent on the spot. Chardin describes them as "warlike, vain, and ambitious of praise; exceedingly luxurious, prodigal, voluptuous, and addicted to gallantry." It is well known that the wars and fiend-like cruelties in which the despots of this country have been engaged, have transformed many of its provinces into scenes of sterility and desolation.—The *Hindoes* are effeminate, luxurious, and early initiated into the arts of dissimulation. They can caress those whom they hate, and behave with the utmost affability and kindness to such as they intend to deprive of existence, by the most sanguinary means. Though they seldom scold or wrangle, they often stab each other insidiously, and, without any public quarrel, gratify a private revenge. The destruction of infants, the immolation of widows, the drowning of aged parents, which prevail among them, and the cruel and idolatrous rites which distinguish their religious services, are too well known to require description.—The *Turks*, though grave, sedate, and rather hypochondriac, yet when agitated by passion, are furious, raging, ungovernable, fraught with dissimulation, jealous, suspicious, and vindictive beyond conception. They are superstitious, and obstinately tenacious in matters of religion, and are incapable of exercising benevolence or even humanity towards Christians, or towards Jews. Interest is their supreme good, and when that comes in competition, all ties of religion, consanguinity, or friendship, are with the generality, speedily dissolved. They have deprived of their liberty, and of their wealth, all who have been subjected to their iron sceptre, and have plunged them into the depths of moral and of mental debasement. The page of history is filled with details of their

devastations and cruelties, and the deeds of injustice and of horror which they have perpetrated, even in our own times, are scarcely equalled by the atrocities of the most savage hordes of mankind.

If we take a survey of the numerous tribes which inhabit the Islands of the Indian and the Pacific Oceans, we shall find similar depraved and malevolent passions, raging without control, and producing all those malignant and desolating effects which have counteracted the benevolence of the Creator, and entailed misery on the human race. The dismal effects of the principle of hatred directed towards human beings, the disposition to engage in continual warfare, and the savage ferocity of the human mind, when unrestrained by moral and prudential considerations, are nowhere so strikingly displayed, as in the isles which are scattered throughout the wide expanse of the Pacific Ocean. Of the truth of these positions we have abundance of melancholy examples, in the reports of missionaries, and in the journals which have been published by late navigators, from which I shall select only two or three examples.

The first instance I shall produce, has a relation chiefly to the inhabitants of *New Zealand*. With respect to these islanders Captain Cook remarks, "Their public contentions are frequent, or rather perpetual; for, it appears from their number of weapons, and dexterity in using them, that war is their principal profession."—"The war-dance consists of a great variety of violent motions, and hideous contortions of the limbs, during which the countenance also performs a part; the tongue is frequently thrust out to an incredible length, and the eye-lid so forcibly drawn up, that the white appears both above and below, as well as on each side of the iris, so as to form a circle around it; nor is any thing neglected so as to render the human shape frightful and deformed. To such as have not been accustomed to such a practice, they appear more like demons than men, and would almost chill the boldest with fear; at the same time they brandish their spears, shake their darts, and cleave the air with their patoo-patoos. To this succeeds a circumstance almost foretold in their fierce demeanour, horrid and disgraceful to human nature, which is, cutting to pieces, even before being perfectly dead, the bodies of their enemies; and, after dressing them on a fire, devouring the flesh, not only without reluctance, but with peculiar satisfaction." There is perhaps nothing that can convey a more striking idea of the actions of pure malevolence, and of the horrible rage and fury of infernal fiends, than the picture here presented of these savage islanders.

These people live under perpetual apprehensions of being destroyed by each other; there being few of their tribes that have not, as they think, sustained wrongs from some other tribe,

which they are continually on the watch to avenge and the desire of a good meal is no small incitement. Many years will sometimes elapse before a favourable opportunity happens, yet the son never loses sight of an injury that has been done to his father.—"Their method of executing their horrible designs is by stealing upon the adverse party in the night, and if they find them unguarded (which is very seldom the case) they kill every one indiscriminately, not even sparing the women and children. When the massacre is completed, they either feast and gorge themselves on the spot, or carry off as many of the dead bodies as they can, and devour them at home, with acts of brutality too shocking to be described. If they are discovered before they execute their bloody purpose, they generally steal off again; and sometimes are pursued and attacked by the other party in their turn. To give quarter, or to take prisoners, makes no part of their military law; so that the vanquished can save their lives only by flight. This perpetual state of war, and destructive method of conducting it, operates so strongly in producing habits of circumspection, that one hardly ever finds a *New Zealander* off his guard, either by night or by day."\* While the mind is kept in such a state of incessant anxiety and alarm, it must be impossible for human beings to taste the sweets of rational, or even of sensitive enjoyment. A melancholy gloom must hang over these wretched beings, and the dark suspicions, and the revengeful passions which agitate their minds, can only fit them for those regions of darkness where the radiations of benevolence are completely extinguished.

The implacable hatred which these savages entertain towards each other, is illustrated, in the following short narrative from Captain Cook.—"Among our occasional visitors was a chief named Kahooru, who, as I was informed, headed the party that cut off Captain Furneaux's people, and himself killed Mr. Rowe, the officer who commanded. To judge of the character of Kahooru, by what I had heard from many of his countrymen, he seemed to be more feared than beloved among them. Not satisfied with telling me that he was a very bad man, some of them even importuned me to kill him: and, I believe, they were not a little surprised that I did not listen to them; for according to their ideas of equity, this ought to have been done. But if I had followed the advice of all our pretended friends, I might have extirpated the whole race; for the people of each hamlet or village, by turns, applied to me, to destroy the other. One would have almost thought it impossible, that so striking a proof of the divided state in which this people live, could have been assigned."

Similar dispositions are displayed throughout

\* *Cooke's Voyages*.

almost all the other islands of the Southern Ocean. The following description is given by M. de la Perouse, of the inhabitants of *Maouna Oyolava*, and the other islands in the *Navigator's Archipelago*. "Their native ferocity of countenance always expresses either surprise or anger. The least dispute between them is followed by blows of sticks, clubs, or paddles, and often, without doubt, costs the combatants their lives." With regard to the women, he remarks: "The gross effrontery of their conduct, the indecency of their motions, and the disgusting offers which they made of their favours, rendered them fit mothers and wives for the ferocious beings that surrounded us." The treachery and ferocity of these savages were strikingly displayed in massacring M. de Langle, the astronomer, and eleven of the crew that belonged to Perouse's vessel, and such was their fierce barbarity, that, after having killed them, they still continued to wreak their fury upon the inanimate bodies with their clubs. The natives of *New Caledonia* are a race of a similar description. Though Captain Cook describes them as apparently a good natured sort of people, yet subsequent navigators have found them to be almost the very reverse of what he described; as ferocious in the extreme, addicted to cannibalism, and to every barbarity shocking to human nature. The French navigator, Admiral D'Entrecasteaux, in his intercourse with these people, received undoubted proofs of their savage disposition, and of their being accustomed to feed on human flesh. Speaking of one of the natives, who had visited his ship, and had described the various practices connected with cannibalism, he says,—"It is difficult to depict the ferocious avidity with which he expressed to us, that the flesh of their unfortunate victims was devoured by them after they had broiled it on the coals. This cannibal also let us know, that the flesh of the arms and legs was cut into slices, and that they considered the most muscular parts a very agreeable dish. It was then easy for us to explain, why they frequently felt our arms and legs, manifesting a violent longing; they then uttered a faint whistling, which they produced by closing their teeth, and applying to them the tip of the tongue; afterwards opening their mouth, they smacked their lips several times in succession."

The characters of the islanders now described, may be considered as common to the inhabitants of the New Hebrides, the Friendly Islands, the Marquesas, the Sandwich, New Guinea, New Britain, the Ladrões, and almost all the islands which are dispersed over the vast expanse of the Pacific Ocean. Captain Cook, when describing the natives of New Zealand, remarks, that, "the inhabitants of the other parts of the South Seas have not even the idea of indecency with respect to any object, or to any action." The inhabitants even of the Society and of the

Sandwich Isles, prior to the state of moral and religious improvement to which they have lately advanced, though their dispositions were somewhat milder than those of the other islands were almost equally low in point of moral debasement. Captain Cook, speaking of the natives of Otaheite, declares, "They are all ar-rant thieves, and can pick pockets with the dexterity of the most expert London blackguard."<sup>4</sup> When describing the societies distinguished by the name of *Arceoy*, he declares, as a characteristic of the female part of the community, "If any of the women happen to be with child, which in this manner of life, happens less frequently than in ordinary cases, the poor infant is smothered the moment it is born, that it may be no incumbrance to the father, nor interrupt the mother in the pleasures of her diabolical prostitution."<sup>†</sup> Another circumstance, stated by the same navigator, exhibits their former moral character in a still more shocking point of view. On the approach of war with any of the neighbouring islands, or on other interesting occasions, human sacrifices were a universal practice. "When I described," says this illustrious voyager, "the Natives at Tongabato, I mentioned, that, on the approaching sequel of that festival, we had been told that ten men were to be sacrificed. This may give us an idea of the extent of this religious massacre on that island. And though we should suppose, that never more than one person is sacrificed on any single occasion at Otaheite, it is more than probable, that these occasions happened so frequently, as to make a shocking waste of the human race; for I counted no less than forty-nine skulls of former victims, lying before the Morai, where we saw one more added to the number. And, as none of these skulls had, as yet, suffered any considerable change from the weather, it may hence be inferred, that no great length of time had elapsed, since this considerable number of unhappy wretches had been offered on this altar of blood."<sup>‡</sup> He also informs us, that human sacrifices were more frequent in the Sandwich, than in any of the other islands. "These horrid rites," says he, "are not only had recourse to upon the commencement of war, and preceding great battles, and other signal enterprises; but the death of any considerable chief calls for a sacrifice of one or more *Toutous*, (that is, vulgar or low persons,) according to his rank; and we were told that ten men were destined to suffer on the death of *Terracoboo*, one of their great chiefs."<sup>§</sup>

Such are a few specimens of the moral dispositions—the hatred, the horrid warfare, and the abominable practices, which are displayed over

<sup>4</sup> Hawkesworth's Narrative of Cook's Voyages, vol. II.

<sup>†</sup> Ibid.

<sup>‡</sup> Ibid.

<sup>§</sup> Hawkesworth's Narrative of Cook's Voyages, Vol. II.

the greater portion of the Eastern and Western Continents, and among the thousands of islands which diversify the surface of the Ocean—dispositions and practices, which, if permitted to extend their influence universally, and without control, would soon extirpate the intelligent creation, and banish happiness from the empire of God.

#### WARLIKE ATTITUDE OF NATIONS.

Were benevolence a characteristic of the inhabitants of our globe, every traveller would be secure from danger from his fellow-men; he might land on every shore without the least suspicion or alarm, and confidently expect that his distresses would be relieved, and his wants supplied, by every tribe of the human race among whom he might occasionally sojourn. No hostile weapons would be lifted up to repel a stranger, when gratifying his curiosity in visiting distant lands, and contemplating foreign scenes; and no instruments of destruction would require to be forged, to preserve a nation from the inroads of destroyers. But when we survey the actual state of mankind, we find almost every nation under heaven, if not actually engaged in war, at least in a warlike attitude, and one of their chief employments consists in devising schemes, either of conquest or revenge, and in furbishing the instruments of death. The following instances may suffice, as illustrations of this position.

The armies of **ASHANTEE**, says Dupuis, amount to upwards of eighty thousand men, armed with tomahawks, lances, knives, javelins, bows, and arrows; and forty thousand, who can occasionally be put in possession of muskets and blunderbusses.—The opposing armies of **MOSLEM** and **DINHERU**, amounted at times to 140,000 men.—The King of **DAHOMY**, and his auxiliaries, can raise about 50,000 men, armed with bows and arrows, sabres, and iron maces.—The king of **BENIN** can arm 200,000, upon an emergency, and furnish 10,000 of them with muskets. In those countries of Africa, where fire-arms and gunpowder are unknown, they wield the following kinds of arms with great dexterity and execution. These are, very strong supple lances, which are barbed and poisoned, targets, bows and arrows, tomahawks, and iron maces; the former of which they are in the practice of poisoning with a venom more deadly than that which is used by any other nation, as its operation is said to be sometimes instantaneous, and its wound, though ever so slight, usually produces death within the lapse of a few minutes.\*

Such is the warlike disposition displayed by a few comparatively insignificant tribes in Africa, and similar dispositions are manifested, and similar attitudes assumed, by almost all the tribes which inhabit that vast continent. Their time,

and their physical and mental exertions, seem to be spent much in war, and in the preparation of warlike instruments, as if these were the great ends for which the Creator had brought them into existence. If the ingenuity and the energies displayed in such preparations and pursuits, were employed in operations calculated to promote the benefit of mankind, what an immense proportion of happiness would be distributed among numerous tribes which are just now sunk into depravity, and into the depths of wretchedness and wo!

Pallas, in his description of the nations inhabiting the *Caucasus*, when speaking of the **CIRCASSIANS**, says, "Persons of wealth and rank never leave the house without a sabre, nor do they venture beyond the limits of the village without being completely arrayed, and having their breast pockets supplied with ball-cartridges." In regard to the lower class, "when they do not carry a sabre, with other arms, they provide themselves with a strong staff, two arshines long, on the top of which is fixed a large iron head, and the lower end is furnished with a sharp iron pike, about eighteen inches long, which they are accustomed to throw expertly, like a dart. The princes and knights pursue no other business or recreation than war, pillage, and the amusements of the chase; they live a lordly life, wander about, meet at drinking parties and undertake military excursions." Among these people, "the desire of revenge, for injuries received, is hereditary in the successors, and in the whole tribe. It remains, as it were, rooted with so much rancour, that the hostile princes or nobles of two different tribes, when they meet each other on the road, or accidentally in another place, are compelled to fight for their lives; unless they have given previous notice to each other, and bound themselves to pursue a different route. Unless pardon be purchased, or obtained by intermarriage between the two families, the principle of revenge is propagated to all succeeding generations."†

It is well known, that in almost all the islands in the Indian and the Southern Oceans, when navigators attempt to land, in order to procure water and provisions, they are almost uniformly opposed by crowds of ferocious savages, armed with long spears, clubs, lances, bows and arrows and, with horrid yells, brandishing them in the most hostile attitudes. In some instances, these warlike attitudes might be accounted for, from a fear of the depredations and murders which might be committed by strangers, with whose dispositions and characters they are unacquainted. But the implacable hatred which they manifest towards even the neighbouring tribes, with which they are acquainted, and of which I have already

\* Dupuis' "Mission to Ashantee, in 1823"

† Pallas' "Travels through the Southern Provinces of the Russian Empire," Vol II. pp. 401. 405.

stated several instances, shows, that war, revenge, and the preparation of the instruments of death, are both their employment, and their delight. Yea, not only savage and half-civilized tribes, but almost every civilized nation on the face of the earth, is found in a hostile attitude with respect to surrounding nations—either actually engaged in a deadly warfare with a foreign power, or preparing for an attack, or keeping up fleets and standing armies, and forging cannons, and balls, and swords, in the prospect of a rupture with neighbouring states. And in such deadly preparations and employments, a great proportion of those treasures is expended, which, if directed by the hand of benevolence, would be the means of transforming the wilderness into a fruitful field, of distributing intelligence and moral principle among all ranks, and of making the hearts of the poor, the widow, and the orphan, “to leap for joy.” What a pitiful picture is here presented of Man, who was originally formed after the image of his Maker, for the purpose of displaying benevolent affections towards his fellows,—now divided into hostile tribes, and brandishing, with infernal fury, at all around, the instruments of destruction! How art thou fallen, O man, from thy original station of dignity and honour! “How is the gold become dim, and the most fine gold changed! The crown is fallen from our heads; we unto us, for we have sinned!”

#### INHUMANITY OF UNCIVILIZED TRIBES TO UNFORTUNATE TRAVELLERS.

In passing through the scene of his earthly pilgrimage, Man is exposed to a variety of distresses and dangers. Sometimes he is exposed to “the pestilence that walketh in darkness,” and to the fever “that wasteth at noon-day.” Sometimes he is exposed to the desolations of the earthquake and the volcano; the blasts of the tempest, the hurricane, and the tornado, and the billows of the stormy ocean; and, at other times, he is exposed to the attacks of the lion, the tiger, and the hyena, in the dark recesses of the forest. It would be well, however, with man, were these the only evils and enemies which he had to encounter. But the greatest enemy which man has to encounter, is *Man* himself—those who are partakers of the same nature, and destined to the same immortal existence; and from these kindred beings, he is exposed to evils and distresses, incomparably greater and more numerous, than all the evils which he suffers from the ravenous beasts of the forest, or from the fury of the raging elements. It is a most melancholy reflection, that, throughout the greater part of the habitable world, no traveller can prosecute his journey, without being in hazard either of being dragged into captivity, or insulted and maltreated, or plundered of his treasures, or deprived of his

life, by those who ought to be his friends and protectors. After he has eluded the pursuit of the lion or the wolf, or after he has escaped, with difficulty, from the jaws of the devouring deep, he is frequently exposed to the fury of demons in human shape, who insult over his misfortunes, instead of relieving the wants of his body, and soothing the anguish of his mind. The following relations, among a numerous series which might be presented to the view of the reader, will tend to illustrate these remarks.

My first example shall be taken from the “Narrative of the Loss of the Grosvenor Indiaman.” This vessel sailed from Trincomalee, June 13th, 1782, on her homeward-bound voyage, and was wrecked on the coast of Caffraria, on the 4th of August following. It is needless to dwell on the circumstances which attended the shipwreck, and on the consternation, distraction, and despair, which seized upon the passengers and the crew, when they became alive to all the terrors of the scene. Shipwreck, even in its mildest form, is a calamity which never fails to fill the mind with horror; but what is instant death, considered as a temporary evil, compared with the situation of those who had hunger, and thirst, and nakedness, to contend with; who only escaped the fury of the waves, to enter into conflicts with the savages of the forest, or the still greater savages of the human race; who were cut off from all civilized society, and felt the prolongation of life to be only the lengthened pains of death?

After losing about twenty men, in their first attempts to land, the remaining part of the crew and the passengers, in number about a hundred, after encountering many difficulties and dangers, reached the shore. Next morning a thousand uneasy sensations were produced, from the natives having come down to the shore, and, without ceremony, carried off whatever suited their fancy. They were at this time about 447 leagues from the Cape of Good Hope, and 226 beyond the limits of any Christian habitation. Their only resource appeared to be, to direct their course by land to the Cape, or to the nearest Dutch settlement. As they moved forward, they were followed by some of the natives, who, instead of showing compassion to this wretched group, plundered them from time to time, of what they liked, and sometimes pelted them with stones. In this way they pursued their journey for four or five days; during which the natives constantly surrounded them in the day, taking from them whatever they pleased, but invariably retired in the night. As they proceeded, they saw many villages, which they carefully avoided, that they might be less exposed to the insults of the natives. At last, they came to a deep gully, where three of the Caffres met them, armed with lances, which they held several times to the captain’s throat. Next day, on coming to a large village, they found these three men, with three

or four hundred of their countrymen, all armed with lances and targets, who stopped the English, and began to pilfer and insult them, and at last fell upon them and beat them. With these inhuman wretches they had to engage in a kind of running fight for upwards of two hours; after which, they cut the buttons from their coats, and presented them to the natives, on which, they went away and returned no more. The following night they were terrified with the noise of the wild beasts, and kept constant watch for fear both of them and the natives. How dreadful a situation, especially for those delicate ladies and children, who had so lately been accustomed to all the delicacies of the East! Next day, as they were advancing, a party of natives came down upon them, and plundered them, among other things, of their tinder-box, flint and steel, which proved an irreparable loss. Every man was now obliged to travel, by turns, with a fire-brand in his hand; and before the natives retired, they showed more insolence than ever, robbing the gentlemen of their watches, and the ladies of their jewels, which they had secreted in their hair. Opposition was vain; the attempt only brought fresh insults or blows.

This group of wretched wanderers now separated into different parties, and took different directions; their provisions were nearly exhausted; and the delay occasioned by travelling with the women and children was very great. Their difficulties increased, as they proceeded on their journey; they had numerous rivers, sometimes nearly two miles in breadth, to swim across in the course of their route, while the women and children were conveyed across on floating stages, at the imminent hazard of their lives, and of being carried down by the impetuous current into the sea. Whole days were spent in tracing the rivers towards their source, in order to obtain a ford. They traversed vast plains of sand, and bleak and barren deserts, where nothing could be found to alleviate their hunger, nor the least drop of water to quench their raging thirst. They passed through deep forests, where human feet had never trod, where nothing was heard but the dreadful howlings of wild beasts, which filled them with alarm and despair. Wild sorrel, berries which the birds had picked at, and a few shell-fish which they occasionally picked up on the shore, were the only food which they had to subsist on for several days; and on some occasions the dead body of a seal, or the putrid carcass of a whale, was hailed as a delicious treat to their craving appetites. One person fell after another into the arms of death, through hunger, fatigue, and despair, and were sometimes obliged to be left in the agonies of dissolution, as a prey to ravenous beasts, or to the fowls of heaven. The following circumstance shows the dreadful situation to which they were reduced for want of food. "It appeared that the captain's steward

had been buried in the sand of the last desert they had passed, and that the survivors were reduced to such extremity, that, after he had been interred, they sent back two of their companions to cut off part of his flesh; but while they proceeded in this horrid business, they had the good fortune to discover a young seal, newly driven on shore, which proved a most 'seasonable relief'."

Imagination cannot form a scene of deeper distress than what the tender sex, and the little children must, in such a case, have experienced. It harrows up the very soul to think what pangs those delicate females who had so lately been inured to all the pleasures and luxuries of India, must have endured, when they were fain to appease their craving appetites on the putrid carcass of a whale, and were obliged to repose on the bare ground, amidst the howlings of the tempest, and the more dismal yells of the beasts of prey. But, amidst this heart-rending scene, their fellow-men, who ought to have been their soothers and protectors, and who had it in their power to have alleviated their distresses, were the greatest enemies they had to encounter, and their appearance filled their minds with greater alarm than if they had beheld a roaring lion, or a raging bear. The following are some specimens of the perfidy and inhumanity of the natives. In passing through a village, one of the company observing, "that a traffic would not be unacceptable, offered them the inside of his watch for a calf; but though they assented to the terms, no sooner had they obtained the price, than they withheld the calf, and drove the English from their village." In the same manner were they used on many other occasions. One time, when resting at a village, where the natives offered no particular resistance, "they produced two bowls of milk, which they seemed willing to barter, but as our wretched countrymen had nothing to give in exchange, they denied them this humble boon without an equivalent, and ate it up themselves." At the same place, they implored in the most impressive terms, to partake with the natives of the spoils of a deer, which they had just killed, but they turned a deaf ear to their solicitations, and insisted, moreover, on their quitting the kraal. On another occasion, "on coming to a large village, the inhabitants set upon them with such fury, that several were severely wounded, and one of them died soon after."

In this manner, did the wretched remains of these hapless wanderers traverse the wilds of Africa, during the space of one hundred and seventeen days, till they accidentally met with some Dutch settlers, when within 400 miles of the Cape. Here they were treated with the kindest attention, and their wants relieved. But, by this time, only 15 or 20 emaciated beings survived, out of more than 120 persons who were on

board the *Grosvenor*. What became of the captain and his party is still unknown. Some are supposed to have perished from hunger, some through grief and fatigue, and others to have been killed by the inhospitable natives.—Now, all the accumulated miseries endured by these unfortunate travellers, and the premature death of nearly a hundred persons, are to be attributed to that spirit of selfishness, inhumanity, and hostility, which, in all ages, has prevented enjoyment, and entailed misery on the human race. Had a principle of love to mankind pervaded the hearts of the wretched Caffres, or had even the common feelings of humanity been exercised towards their fellow-creatures in distress, the whole of the unfortunate individuals that perished in Africa's inhospitable clime, might have been conducted in safety to their friends and their native land.

My next example is taken from M. De Brisson's "Narrative of his shipwreck, and captivity among the Moors."

M. Brisson was shipwrecked on the coast of Barbary, on the 10th July, 1785, and, after much difficulty and danger, he, along with the crew, escaped safe to land. No sooner had they reached the shore, than they were surrounded by a crowd of savages, and seized by the collars. 'The Arabs,' says M. Brisson, "armed with cutlasses and large clubs, fell upon my companions with incredible ferocity; and I had the mortification of soon seeing some of them wounded, whilst others, stripped and naked, lay stretched out and expiring on the sand. The news of our shipwreck being spread abroad through the country, we saw the savages running with the greatest eagerness from all quarters. The women, enraged that they could not pillage the ship, threw themselves upon us, and tore from us the few articles of dress which we had left. While they went to the shore to obtain more plunder, a company of Ouadelims discovered and pillaged our retreat, and beat us in the most unmerciful manner, till I was almost at the last gasp. My mind was so much affected that I could not refrain from tears: and some of the women having observed it, instead of being moved with compassion, *threw sand in my eyes*, 'to dry up my tears,' as they expressed it." M. Brisson was forced, by these rude barbarians, into the interior of the country, as a captive. "After passing," says he, "mountains of a prodigious height, which were covered with small sharp flints, I found that the soles of my feet were entirely covered with blood. I was permitted to get up behind my master on his camel; but as I was naked, I could not secure myself from the friction of the animal's hair, so that in a very little time my skin was entirely rubbed off. My blood trickled down over the animal's sides, and this sight, instead of moving the pity of these barbarians, *afforded them a subject of diversion*.

They sported with my sufferings; and that their enjoyments might be still higher, they spurred on their camels." After travelling for sixteen days, during which they were exposed to the greatest fatigue, and the most dreadful miseries, they at length reached the place of their destination, in a most wretched and exhausted condition. And what was the manner of their reception? The women having satisfied their curiosity in inquiries about the strangers, immediately began to load them with abuse. "They even spat in our faces," says M. B. "and pelted us with stones. The children, too, copying their example, pinched us, pulled our hair, and scratched us with their nails, whilst their cruel mothers ordered them to attack sometimes one and sometimes another, and took pleasure in causing them to torment us."

They were compelled to work at the most fatiguing and menial employments, and beaten with severity when they did not exert themselves far beyond their strength, while they were denied a single morsel of wholesome food. "As we were Christians," says the narrator, "the dogs fared better than we, and it was in the basins destined for their use that we received our allowance: our food was raw snails, and herbs and plants trodden under foot by the multitude." In this manner did these unfortunate travellers drag out the period of their captivity; some died of the blows and harsh treatment they received, and others died of hunger and despair. M. Brisson one day found the captain of the vessel in a neighbouring hamlet, stretched out lifeless upon the sand, and scarcely distinguishable but by the colour of his body. In his mouth he held one of his hands, which his great weakness had no doubt prevented him from devouring. He was so changed by hunger, that his body exhibited the most disgusting appearance; all his features being absolutely effaced. A few days after, the second captain, having fallen down through weakness below an old gum tree, became a prey to the attacks of a monstrous serpent. Some famished crows, by their cries, frightened away the venomous animal, and, alighting on the body of the dying man, were tearing him to pieces, while four savage monsters, in human shape, still more cruel than the furious reptile, beheld this scene without offering him the least assistance. "I attempted to run towards him," says M. Brisson, "and to save his life, if possible, but the barbarians stopped me, and after insulting me, said, 'This Christian will soon become a prey to the flames.'" The bad state of health of this unfortunate man would not permit him to labour, and his master and mistress would not allow him the milk necessary for his subsistence.—Such were the scenes of inhumanity and cruelty which M. Brisson witnessed, during the whole period he remained in the territories of these barbarous tribes. They present to our

view so many pictures of abominable selfishness and even of pure malevolence. And it is a most melancholy reflection, that numerous tribes of a similar description are spread over a very large portion of the habitable world. It makes one feel degraded when he reflects that he is related, by the ties of a common nature, to beings possessing a character so malignant and depraved.

I shall select only another example, illustrative of this topic, extracted from the travels of Mr. Park. This enterprising traveller prosecuted a journey of many hundred miles in the interior of Africa, for the most part on foot, and alone. Sometimes, his way lay over a burning sandy wilderness, where he found little to alleviate either his hunger or his thirst; and sometimes he travelled among woods and thickets, and across rivers and marshes, exposed to the wild beasts, and without any path to guide him. Though the negroes of that country frequently relieved his wants and distresses, yet the Moors used him with great cruelty and inhumanity, so that he hardly escaped with life. The chiefs through whose territories he passed, generally exacted a tribute from him, so long as he had any thing to give, and, under that plea, they often robbed him of all the articles which he had it not in his power to conceal. When he passed through the town of Deena, the Moors insulted him in every form which malignity could invent. A crowd of them surrounded the hut in which he lodged, and, besides hissing and shouting, uttered much abusive language. Their aim seemed to be to provoke Park to make retaliation, that they might have some pretence to proceed to greater outrages, and to rob him of his property. Suspecting their intentions he bore all with the greatest patience, and, though they even spit in his face, he showed no marks of resentment. Disappointed in their aim, they had recourse to an arguement common among Mahometans, to convince themselves that they had a right to whatever the stranger might have in his possession. He was a *Christian*. They opened his bundles, and took whatever they thought might be of use, and whatever suited their fancy.

Having been kept for some time in captivity by a Moorish tribe, they not only robbed him of the few articles which were still in his possession, but insulted and oppressed him with the most wanton cruelty. The day was passed in hunger and thirst; to hunger and thirst were added the malignant insults of the Moors, of whom many visited him, whose only business seemed to be to torment him. He always saw the approach of the evening with pleasure; it terminated another day of his miserable existence, and removed from him his troublesome visitants. A scanty allowance of *koukous*,\* and of salt and water, was

brought him generally about midnight. This scanty allowance was all that he and his two attendants were to expect during the whole of the ensuing day. "I was a stranger," says he, "I was unprotected, and I was a Christian; each of these circumstances is sufficient to drive every spark of humanity from the heart of a Moor. Anxious, however, to conciliate favour, and, if possible, to afford the Moors no pretence for ill-treating me, I readily complied with every command, and patiently bore every insult. But never did any period of my life pass away so heavily. From sun-rise to sun-set, was I obliged to bear, with an unruffled countenance, the insults of the rudest savages upon earth." Having, at length, made his escape from these barbarians, he declares, "It is impossible to describe the joy that arose in my mind, when I looked around, and concluded that I was out of danger. I felt like one recovered from sickness. I breathed freer; I found unusual lightness in my limbs; even the desert looked pleasant; and I dreaded nothing so much as falling in with some wandering parties of the Moors, who might convey me back to the land of thieves and murderers from which I had just escaped."—Alas! what a load of sorrow and of misery have the selfishness and inhumanity of man accumulated upon the heads of forlorn and unfortunate sufferers! While our disconsolate traveller, after his escape, was wandering in an unknown desert, fainting with hunger, and parched with thirst, surrounded with pitchy darkness, which was only relieved by the flashes of the lightnings; where no sounds were heard but the howlings of wild beasts, and the rolling thunders:—"About two in the morning," says he, "my horse started at something, and, looking round, I was not a little surprised to see a light, at a short distance among the trees, and supposing it to be a town, I groped along the sand, in hopes of finding corn stalks, cotton, or other appearances of cultivation, but found none. As I approached, I perceived a number of lights in other places, and, leading my horse cautiously towards the light, I heard, by the lowing of the cattle, and the clamorous tongues of the herdsmen, that it was a watering place, and most likely belonged to the Moors. Delightful as the sound of the human voice was to me, I resolved once more to strike into the woods, and rather run the risk of perishing with hunger, than trust myself again into their hands."—It is a most affecting consideration, and shows to what a degree of malignity human beings have arrived, when a hungry, houseless, and benighted traveller prefers to flee for protection to the haunts of the beasts of prey, rather than commit himself to the tender mercies of those who are partakers of the same common nature, and who have it in their power to alleviate his distresses.

Mr. Park, when among the Moors, was forced to pass many days, almost without drink, under

\* A species of food somewhat resembling *Scotch porridge*.

a burning climate, where, to a European, the heat is almost insufferable. His raging thirst induced him to run every risk, and to burst through every restraint. He sent his boy to the wells to fill the skin which he had for holding water; but the Moors were exasperated that a Christian should presume to fill his vessel at wells consecrated to the use of the followers of Mahomet. Instead, therefore, of permitting the boy to carry away water, they gave him many severe blows; and this mode of treatment was repeated as often as an attempt was made.—On another occasion, when awaking from a dream, in which, during his broken slumbers, his fancy had transported him to his native country, and placed him on the verdant brink of a transparent rivulet, and perceiving that his raging thirst had exposed him to a kind of fever, he resolved to expose himself to the insults of the Moors at the wells, in hopes that he might procure a small supply. When he arrived at them he found the Moors drawing water. He desired permission to drink, but was driven from well to well with reiterated outrage. At length he found one well where only an old man and two boys drew for their cattle. He earnestly begged a small quantity. The old man drew the bucket from the well, and held it out. Park was about eagerly to seize it, when the Moor, recollecting that the stranger was a Christian, instantly threw the water into the trough, where the cows were already drinking, and told Park to drink *thence*. He hesitated not for a moment. His sufferings made even this offer acceptable. He thrust his head between those of two cows, and, with feelings of pleasure which can be experienced only by those who have been reduced to a similar state of wretchedness, he continued to quench his thirst till the water was exhausted, and “till the cows began to contend with each other for the last mouthful.”

In this instance, we can partly account for the barbarity of the action, from the inveterate prejudices which all Mahometans entertain against Christians; but it still remains to be accounted for, why any one should refuse to a suffering fellow-creature the common bounties of Providence, which he has in his power to bestow, however different he may be in complexion, in national character, or in the religion he professes. A religion which encourages such prejudices, and which leads to such inhumanity, must be an abomination in the sight of Him who has a special regard to the wants of all his creatures, and who “sendeth rain to refresh the fields of the just and of the unjust.” The prevalence of such characters and dispositions over so large a portion of the world, shows that the moral constitution of man has suffered a sad derangement since the period when he proceeded as a pure intelligence from the hands of his Creator.

Such incidents as those to which I have now

adverted, when properly considered, are calculated to inspire us with contentment, and to excite to gratitude for the common blessings which we enjoy without the least fear of danger or annoyance. How often do we enjoy the refreshment of a delicious beverage, without thinking of the parched tongues of the African pilgrims; and how often do we spurn at a wholesome dish, which would be hailed with transports of gratitude by the houseless and hungry wanderer of the desert! Yea, how many are there, even in our civilized country, who enjoy, in luxurious abundance, all the blessings which nature and art can furnish, who never once acknowledge, with heart-felt gratitude, the goodness of Him “who daily loads them with his benefits,” nor reflect on the wants and the sufferings of their fellow-men! Mr. Park, when oppressed with hunger and fatigue, applied, at the chief magistrate’s house, in a village named Shrilla, for some relief, but was denied admittance. He passed slowly through the village till he came without the walls, where he saw an old motherly-looking woman at the door of a mean hut. She set before him a dish of boiled corn, that had been left the preceding night, on which he made a tolerable meal. “Overcome with joy,” says Park, “at so unexpected a deliverance, I lifted up my eyes to heaven, and, while my heart swelled with gratitude, I returned thanks to that gracious and bountiful Being, whose power had supported me under so many dangers, and had now spread for me a table in the wilderness.”

When Mr. Park was returning from the interior of Africa, he was encountered by a party of armed negroes, who led him into a dark place of the forest through which he was passing, and stripped him entirely naked, taking from him every thing which he possessed, except an old shirt and a pair of trowsers. He begged them to return his pocket compass; but, instead of complying with his request, one of them assured him, that, if he attempted to touch that, or any other article, he would immediately shoot him dead on the spot. He was thus left in the midst of a vast wilderness, in the depth of the rainy season, naked and alone, without food, and without the means of procuring it; surrounded by savage animals, and by men still more savage, and 500 miles from the nearest European settlement. “All these circumstances,” says this intrepid traveller, “crowded at once on my recollection, and, I confess, my spirits began to fail me. I considered that I had no other alternative, but to lie down and die. The influence of religion, however, aided and supported me. At this moment, painful as my reflections were, the extraordinary beauty of a small moss irresistibly caught my eye. Can that Being, thought I, who planted, watered, and brought to perfection, in this obscure part of the world, a thing which appears of so small importance, look with un-

concern on the situation and sufferings of creatures formed after his own image? Surely not. Reflections like these would not allow me to despair. I started up, and, disregarding both hunger and fatigue, travelled forwards, assured that relief was at hand, and I was not disappointed." Thus was this unfortunate adventurer delivered, by the care of Providence, from those accumulated distresses which had been brought upon him by the malignity and inhumanity of man.

Such are a few specimens of the inhumanity displayed by uncivilized tribes towards strangers, and unfortunate voyagers and travellers. They exhibit dispositions and conduct directly repugnant to every principle of benevolence, and present to our view a gloomy prospect of the difficulties and dangers to be surmounted by philanthropic missionaries, before the habitable world can be thoroughly explored, and before the blessings of knowledge, civilization, and religion can be communicated to the benighted and depraved tribes of mankind.

#### MALEVOLENT DISPOSITIONS, AS DISPLAYED IN DISFIGURING THE HUMAN BODY.

The human frame, when preserved in its original state, is one of the finest pieces of mechanism which the mind can contemplate. In beauty, in symmetry, in the harmony and proportion of all its parts and functions, it is superior to the organical structures of all the other ranks of sensitive existence. There is no part imperfect or deformed, no part defective, and no part useless or redundant. All its members are so constructed and arranged as to contribute to the beauty and perfection of the whole, and to the happiness of the intelligent mind by which it is governed and directed. In combination with the power of thought and volition, and when unstained by malignant passions, it is a visible representative of the Creator, having been formed after his image; and it displays, in a most striking manner, the wisdom and the goodness of its Almighty Maker. But, notwithstanding the acknowledged excellence of the human frame, it has been the practice of the degraded tribes of mankind, in almost every country, and in every age, to disfigure its structure, and to deface its beauty; as if the Creator, when he formed it, had been deficient in intelligence and in benevolent design. Such practices, I am disposed to think, imply a principle of malevolence directed towards the Creator, and a disposition to find fault with his wise contrivances and arrangements. At any rate, they display a degree of ignorance and folly, a vitiated taste, and a degradation of mind, inconsistent with the dignity of a rational intelligence. The following facts will, perhaps, tend to illustrate these remarks:—

Condamine, when describing the natives of South America, informs us, that the Omaguas, and some other savages, flatten the faces of their

children, by lacing their heads between two boards; that others pierce the nostrils, lips, or cheeks, and place in them feathers, the bones of fishes, and similar ornaments;—and that the savages of Brazil pull the hair out of their beards, their eye-brows, and all parts of their bodies, which make them have an uncommon, and a ferocious appearance. Their under-lip they pierce, and, as an ornament, insert into it a green stone, or a small polished bone. Immediately after birth the mothers flatten the noses of their children. The whole of them go absolutely naked, and paint their bodies of different colours.—Captain Cook informs us, that, in New Zealand, both sexes mark their faces and bodies with black stains, similar to the tattooing in Otaheite. The men, particularly, add new stains every year, so that, in an advanced period of life, they are almost covered from head to foot. Besides this, they have marks impressed, by a method unknown to us, of a very extraordinary kind. They are furrows of about a line deep, and a line broad, such as appear upon the bark of a tree which has been cut through after a year's growth. The edges of these furrows are afterwards indented by the same method, and, being perfectly black, they make a most frightful appearance. Both sexes bore their ears: they gradually stretch the holes till they are so large as to admit a finger. Into these holes they put feathers, coloured cloth, bones of birds, twigs of wood, and frequently the nails which they received from the ships.—The same voyager, when describing the New Hollanders, tells us,—“Their chief ornament is a bone, which is thrust through a hole bored in the cartilage which divides the nostrils. This bone is as thick as a man's finger, and six inches in length. It reaches quite across the face, and so effectually stops up both nostrils, that they are forced to keep their mouths wide open for breath, and snuffle so when they attempt to speak, that they are scarcely intelligible to each other. Our seamen with some humour, called it their *sprit-sail* yard; and indeed it had so ludicrous an appearance, that, till we were used to it, we found it difficult to restrain from laughter.” He also describes a custom of a peculiar nature which prevails in the Friendly Islands. “The greater part of the inhabitants, both male and female, were observed to have lost one or both of their little fingers. This custom seemed not to be characteristic of rank, of age, or of sex; for, with the exception of some young children, very few people were discovered in whom both hands were perfect. They likewise burn or make incisions in their cheeks.”

All the eastern nations are said to have a predilection for long ears. Some draw the lobe of the ear, in order to stretch it to a greater length, and pierce it so as to allow the admission of an ordinary pendant. The natives of *Lass* so pre-

artificially widen the holes in their ears, that a man's hand may be thrust through them. Hence, the ears of these people often descend to the tops of their shoulders.\* Gentil assures us, that the women, in the northern parts of China, employ every art in order to diminish their eyes. For this purpose, the girls, instructed by their mothers, extend their eye-lids continually, with the view of making their eyes oblong and small. These properties, in the estimation of the Chinese, when joined to a flat nose, and large, open, pendulous ears, constitute the perfection of beauty.—We are informed by Struys, that the women of Siam wear so large and heavy pendants in their ears, that the holes gradually become wide enough to admit a man's thumb. The natives of New Holland pull out the two fore-teeth of the upper jaw. In Calicut, there is a band of nobles called *Naires*, who lengthen their ears to such a degree, that they hang down to their shoulders, and sometimes even lower.† The Arabs paint their lips, arms, and the most conspicuous parts of their bodies, with a deep blue colour. This paint, which they lay on in little dots, and make it penetrate the flesh, by puncturing the skin with needles, can never be effaced. Some of the Asiatics paint their eye-brows of a black colour, and others eradicate the hairs with *rassia*, and paint artificial eye-brows, in the form of a black crescent, which gives them an uncommon and ugly appearance. The inhabitants of Prince William's Sound, paint their faces and hands, bore their ears and noses, and slit their under lips. In the holes made in their noses, they hang pieces of bone or ivory, which are often two or three inches long; and, in the slit of the lip, they place a bone or ivory instrument with holes in it, from which they suspend beads that reach below the chin. These holes in the lip disfigure them greatly, for some of them are as large as their mouths.‡

Such distortions of the beautiful structure of the human frame, are not peculiar to the savage tribes of the human race, but are practised by nations which have made considerable advances in science and civilization. It is well known that, in China, a ridiculous custom prevails, of rendering the feet of their females so small, that they can with difficulty support their bodies. This is deemed a principal part of their beauty; and no swathing nor compression is omitted, when they are young, to give them this fancied accomplishment. Every woman of fashion, and every woman who wishes to be reckoned handsome, must have her feet so small, that they could easily enter the shoe of a child of six years of age. The great toe is the only one left to act with freedom; the rest are doubled down under the foot, in their tenderest infancy, and restrained by

tight bandages, till they unite with, and are buried in the sole. I have inspected a model of a Chinese lady's foot, exactly of this description, which, I was assured, was taken from life. The length was only two inches and three-fourths; the breadth of the base of the heel, seven eighths of an inch; the breadth of the broadest part of the foot, one and one fourth of an inch; and the diameter of the ankle, three inches above the heel, one and seven eighths of an inch. With feet of this description the Chinese ladies may be said rather to totter than to walk; and, by such practices, they evidently frustrate the benevolent intentions of the Creator, and put themselves to unnecessary inconvenience and pain. Yet such is the powerful influence of fashion, however absurd and ridiculous, that women of the middling and inferior classes frequently suffer their feet to be thus maimed and distorted, in order to ape the unnatural customs of their superiors.

We have every reason to believe that the harsh and ugly features, and the ferocious aspect, by which numerous tribes of mankind are distinguished, are owing to such voluntary distortions of the human frame, and to the filthy and abominable practices in which they indulge. Father Terte assures us, that the flat noses of the negroes are occasioned by a general practice of mothers, who depress the noses of their newborn infants, and squeeze their lips, in order to thicken them; and that those children who escape these operations have elevated noses, thin lips, and fine features.—It is somewhat unaccountable, and it shows the perversity of the human mind, in its present degraded state, that such practices should be so general, and so obstinately persisted in, when we consider the pain and inconvenience with which they are attended.—To pull the hairs of the chin or eye-brows from the roots; to slit the under lip, till the incision be as large as one's mouth; to pierce the nostrils, till a bone as large as a man's finger can be thrust through them; and to cover the body with black streaks, which make the blood to flow at every stroke of the instrument by which they are produced, must be attended with excruciating pain. Sir Joseph Banks, who accompanied Captain Cook in his first voyage, was present, in the island of Otaheite, at the operation of tattooing, performed on the back of a girl of thirteen years of age. The instrument used had twenty teeth; and at each stroke, which was repeated every moment, issued an ichor or serum, tinged with blood. The girl bore the pain with great resolution, for some minutes, till, at length, it became so intolerable, that she burst out into violent exclamations; but the operator, notwithstanding the most earnest entreaties to desist, was inexorable, while two women, who attended upon the occasion, both chid and beat her for struggling.

\* Smellie's Philosophy of Natural History, vol. II.  
† Ibid. ‡ Pertlock's Voyage round the World.

I am therefore disposed to view such absurd and barbarous practices, as intimately connected with the operation of a principle of malevolence, as an attempt to frustrate the wise designs of divine benevolence, and as directly repugnant to the spirit of Christianity, and to the benevolent precepts of the gospel of peace. And it becomes some of the ladies, and the dandies of modern Europe to consider, whether some of their awkward attempts to improve the symmetry of the human frame ought not to be viewed in the same light. Not many years ago, it was considered, in the higher circles of society, as an admirable improvement of the female form, to give the lower half of the body the appearance of the frustum of a large tun, as if it had been ten times the capacity of its natural size, by supporting their robes with enormous hoops;—and, about the same period, the lower ranks of female society considered it as the perfection of proportion and beauty, to have their waists compressed into the smallest possible space, till the vital functions, in many instances, were deranged, and ultimately destroyed. Were the dictates of sound reason universally attended to, and were the influence of Christianity fully felt among all nations, the preposterous and savage practices to which I have now adverted, would not only be discontinued, but held in abhorrence. And were such customs completely abolished, we might soon expect to behold, among all the tribes of mankind, every distortion of the features or the countenance removed, and the human form restored to its original beauty and perfection. Instead of a warlike visage, and a ferocious aspect, and the frightful appearance of naked savages, streaked with colours of black and blue, we should behold, in every land, every countenance beaming with the radiations of benevolence, and reflecting the moral image of the Creator.

#### MALEVOLENCE AS IT APPEARS IN THE RELIGION OF SAVAGE TRIBES.

There is scarcely a nation on the surface of the globe but what appears to have some impressions of the existence of a Superior Power, and to have formed a system of religious worship. But, it is a striking fact, that, among the greater portion of human beings, their religious notions, and their sacred rites, instead of breathing a spirit of kindness and benevolence towards their fellow-creatures, are blended with a principle of hatred and revenge. This might be illustrated by an induction of a great variety of instances, in reference to almost every uncivilized portion of the human race. I shall content myself, however, with stating only one instance, in reference to the *Nesserie*, a tribe not much known in Europe, and which may serve as an example of many others.

The territory of this people extends from Antioch nearly to Tripoli. They occupy almost

all the mountains to the east of Latakia, and a great part of the plain. Among them is perceived a mixture of the religious usages of Paganism of the Jewish law, of that of Mahomet and Ali, and of some dogmas of the Christian Religion. —The women are considered as a part of the domestic animals of the house, and treated as slaves. They have no idea of religion, and when they are bold enough to inquire of their masters concerning it, the latter answer them, that their religion is, to be charged with the reproduction of the species, and to be subject to the will of their husbands.—The *Nesserie* say their prayers at midnight, and before sun-set. They may say them either sitting, standing, or walking; but they are obliged to begin again repeating their ablution, if they speak to a person not of their religion,—if they perceive, either near or at a distance, a camel, a pig, a hare, or a negro. In their prayers, they curse the man who shaves below the chin, him who is impotent, and the two Caliphs, Omar and Abou-Bekr. They detest the Turks, to whom they are sworn enemies. This warlike people of mountaineers would be strong enough to shake off the yoke of the Turks, and live independently, if they were not divided by interested motives, almost all occasioned by implacable family hatreds. They are vindictive, and cherish their rancour for a length of time: even the death of the guilty person cannot assuage their fury; their vengeance is incomplete, if it does not fall besides on one or several members of his family. They are so obstinately superstitious in their attachment to their peculiar system, that no threats nor punishments can extort from them the secrets of their religion.\*

Here, then, we are presented with a system of religion which appears to be founded on malevolence,—which directs its devotees to curse their fellow-men—which leads them to keep their women in profound ignorance of every thing which they hold sacred—which induces them to conceal its mysteries from all the rest of the world—and which, in so far from producing any beneficial effects on their own conduct, leads to “implacable family hatreds.” A religion, unless it be founded on a principle of benevolence, is unworthy of the name; it must be an abhorrence in the sight of God, and can never communicate happiness to man. And were we to examine the various religious systems which prevail in the numerous islands of the Indian and Pacific Oceans, in Cabul, Thibet, and Hindostan, and among the uncivilized tribes which are scattered over a large portion of Asia and of Africa, we should find them, not only blended with malevolent principles and maxims, but sanctioning the perpetration of deeds of cruelty, obscenity, and horror.

In the preceding pages, I have endeavoured to

\* See Dupont's “Memoirs of the Manners and Religious Ceremonies of the *Nesserie*,” a work lately published.

illustrate some of the prominent features in the moral character of the savage and uncivilized tribes of the human race. The examples I have selected have not been taken from the records of missionaries, or of professed religionists, who might be suspected by some to give an exaggerated description of the depravity of the Pagan world—but from the unvarnished statements of respectable voyagers and travellers, who could have no motives for misrepresenting the facts which they have recorded. These illustrations might have been extended to a much greater length, had it been consistent with the limited nature of the present work. Instead of occupying only forty or fifty pages, they might have been extended so as to have filled as many volumes; for every book of travels, as well as every historical document, contains a record of the operations of malignity, and of the diversified modes in which human depravity is displayed. The dispositions which I have illustrated, it will be readily admitted, are all of a malignant character, directly repugnant to that benevolent principle which forms the basis of the moral laws of the universe. And when we consider, that such malevolent dispositions are displayed by a mass of human beings, amounting to more than three fourths of the population of the globe, and that true happiness cannot be experienced where malignant passions reign uncontrolled, a benevolent mind cannot refrain from indulging a thousand melancholy reflections, when it casts its eye over the desolations of the moral world, and from forming an anxious wish, that the period may soon arrive, when the darkness which covers the nations shall be dispelled, and when benevolence and peace shall reign triumphant over all the earth.

I shall now endeavour to present a few facts and sketches which may have a tendency to illustrate the present state, and the moral character and aspect of the civilized world.

### SECTION III.

#### MORAL STATE OF CIVILIZED NATIONS.

The present population of the globe may be estimated at about 800 millions. Of these, if we except the empires of China and Hindostan, we cannot reckon above 180 millions as existing in a state of enlightened civilization; a number which is less than the fourth part of the human race. Were even this small portion of mankind uniformly distinguished for intelligence, and for the practice of benevolence, it would form a glorious picture for the philanthropist to contemplate; and would be a sure prelude of the near approach of that happy period, when "*all the ends of the earth shall remember and turn to the Lord, when all the kindreds of the nations shall do*

homage unto him, and when there shall be nothing to hurt nor destroy" among all the families of mankind. But alas! when we investigate the moral state even of this portion of human beings, we find the principle of malignity distinctly visible in its operations, and interwoven, in numerous and minute ramifications, through all the ranks and gradations of society. Though its shades are less dark and gloomy, they are no less real than among the hordes of Africa and Tartary, and the other abodes of savage life. To illustrate this position is the object of the following sketches; in which I shall chiefly refer to the state of society among the nations of Europe, and the United States of America, and particularly to the moral character and aspect of the British empire.

I shall, in the first place, consider the operation of the malevolent principle as it appears in the actions and dispositions of the young, and in the modes of tuition by which they are trained.

In many thousands of instances, it may be observed, that, even before a child has been weaned from its mother's breasts, malignant dispositions are not only fostered, but are regularly taught both by precept and example. Does a child happen to hit its head accidentally against the corner of a table—it is taught by its nurse, and even by its mother, to avenge the injury on the inanimate object which caused it, and to exhibit its prowess and its revenge by beating the table with all its might. Does it cry, through peevishness or pain—it is immediately threatened with being thrown into the ditch, tossed out of the window, or committed to the charge of some frightful spectre. Is it expedient to repress its murmurings, and to cajole it into obedience—it is then inspired with fallacious hopes, and allured with deceitful promises of objects and of pleasures which are never intended to be realized. Does it require to have its physical powers exercised—a wooden sword or a whip is put into its hands; and it is encouraged to display its energies in inflicting strokes on a dog, a cat, or any of its play-fellows or companions. I have seen a little urchin of this description, three or four years of age, brandishing its wooden sword with all the ardour of a warrior, and repeating its strokes on every person around, while the foolish parents were exulting in the prowess displayed by their little darling, and encouraging it in all its movements. By these and similar practices, revenge, falsehood, superstition, and the elements of war, are fostered in the youthful mind; and is it to be wondered at, that such malignant principles and passions should "grow with their growth, and strengthen with their strength," till they burst forth in all those hideous forms which they assume amidst the contests of communities and of nations?—The false maxims by which children are frequently trained under the domestic roof, and the foolish indulgence with which

they are treated by injudicious parents, in too many instances lay the foundation of those petulant and malignant tempers, which are a pest both to Christian and to general society. Indulgence often leads to an opposite extreme; and produces such a degree of insubordination among the young, that nothing is to be seen and heard but a perpetual round of scolding and beating, and the contest of angry passions. "Among the lower ranks of people," says Dr. Witherspoon, "who are under no restraint from decency, you may sometimes see a father or mother running out into the street, after a child who has fled from them, with looks of fury and words of execration, and they are often stupid enough to imagine that neighbours or passengers will approve them in this conduct." Wherever parental authority is thus undermined, and such conduct uniformly pursued, a sure foundation is laid for an extensive display, in after life, of the malignant passions of the human heart.

If we follow our youth from the nursery to the school-room, we shall find the same malevolent affections developing themselves on a larger scale, and indirectly cherished, by the books they read, the discipline by which they are trained, and the amusements in which they indulge. Here we may behold one little fellow taking a malicious pleasure in pinching his neighbour, another in kicking him, a third in boxing him, a fourth in tearing his book, a fifth in pilfering his property, and a sixth in endeavouring to hold him up to scorn and ridicule; and all of them combined to frustrate, if possible, the exertions of their teacher, and to prevent their own improvement.—If we look into the majority of the books which are read in schools, we shall find them full of encomiums upon war, and upon warriors. The Cæsars, the Alexanders, and the Bonapartes, whose restless ambition has transformed the earth into scenes of desolation and carnage, are represented as patterns of every thing that is brave, noble, generous, and heroic. The descriptive powers of the poet are also called in, in order to inflame the youthful mind with warlike dispositions, and to excite an ardent desire for mingling in scenes of contention, and for the acquisition of false glory and of military renown. Hence, there is no part of their school exercises in which the young so much delight, and in which they so much excel, as in that in which they are called upon to recite such speeches as "Sempronius's speech for war," or to ape the revengeful encounter of Norval and Glenalvon. While the spirit of war is thus virtually cherished, the counteraction of vicious propensities, and the cultivation of the moral powers of the young, are considered as a matter of inferior importance, and, in many seminaries of instruction, are altogether overlooked. Many of the school collections to which I allude—instead of exhibiting, in simple language, the beauties and sublimities of the works of nature, the

displays of the natural and moral character of the Deity, the facts of Sacred History, the morality of the Gospel, the scenes of rural and domestic life, and the operations of philanthropy—are filled with extracts from metaphysical writers, from parliamentary debates, and from old plays, novels, and farces, which are frequently interlarded with oaths, obscenity, and the slang of Billingsgate, which can have no other tendency than to pollute and demoralize the youthful mind. needs, therefore, excite no surprise, that the great body of mankind is still so deficient in rational information and substantial knowledge, and that a warlike spirit is afloat, and exerting its baleful influence among the nations.

If we follow the young from the school-room to the play-ground, or to the streets and the highways, we shall find the spirit of malignity displaying itself in a vast diversity of forms. *Here*, we may behold one mischievous little boy slapping his neighbour in the face, another tearing his neighbour's clothes, another tossing his cap into a dirty ditch, another chalking his back in order to hold him up to ridicule, and another pouring out upon him a torrent of nicknames, and of scurrilous epithets. *There*, we may behold a crowd of boys pelting a poor beggar or an unfortunate maniac with stones and dirt for their diversion; mocking the lame, the deformed, and the aged, and insulting the passing traveller. And, when such objects do not happen to occur, we may see them assailing, with a shower of stones, a cat, a dog, a hare, or a fowl, that happens to cross the path, and enjoying a diabolical pleasure in witnessing the sufferings of these unfortunate animals. *Here*, we may behold an insolent boy insulting a timid girl, overturning her pitcher, and besmearing her with mire;—these we behold another saluting his fellow with a malignant scowl, and a third brandishing his whip, and lashing a horse or a cow, for his amusement. On the one hand, we may sometimes behold a ring of boys, in the centre of which two little demons are engaged in mutual combat, with eyes glaring with fury and revenge, exerting their physical powers to the utmost stretch, in order to wound and lacerate, and cover with blood and gore, the faces of each other: on the other hand, we may behold an unfortunate boy, whom a natural temperament, or a virtuous principle, prevents from engaging in similar combats, assailed with opprobrious epithets, and made a laughing-stock, and an object of derision and scorn, because he will not be persuaded to declare war against his neighbour. And, what is still more atrocious and disgusting, we may behold *children* of thirty or forty years of age, encouraging such malevolent dispositions, and stimulating such combatants in their diabolical exertions!\* Such infernal

\* The practice of boxing, among boys, which is generally prevails, especially in England, is a disgrace to the boasted civilization and Christianity of

practices, among creatures originally formed after the divine image, if they were not so common, would be viewed by every one in whose breast the least spark of virtue resides, with feelings of indignation and horror.

The great body of our youth, habituated to such dispositions and practices, after having left school at the age of fourteen or fifteen—a period when head-strong passions and vicious propensities begin to operate with still greater violence—have access to no other seminaries, in which their lawless passions may be counteracted and controlled, and in which they may be carried forward in the path of moral and intellectual improvement. Throughout the whole of the civilized world, I am not aware that there exist any regular institutions exclusively appropriated for the instruction of young persons, from the age of fifteen to the age of twenty-five or upwards, on moral, religious, and scientific subjects; in order to expand their intellectual capacities, and to direct their moral powers in the path of universal benevolence. Yet, without such institutions, all the knowledge and instructions they may have previously acquired, in the great majority of instances, are rendered almost useless and inefficient for promoting the great end of their existence. From the age of fifteen to the age of twenty-five, is the most important period of human life; and, for want of proper instruction and direction, during this period, and of rational objects to employ the attention at leisure hours, many a hopeful young man has been left to glide insensibly into the mire of vice and corruption,

that country, and to the superintendents of its public seminaries. That pugilistic contests between grown-up savages in a civilized shape, should be publicly advertised, and described in our newspapers, and the arena of such contests resorted to by so many thousands of the middling and higher classes of society, is a striking proof that the spirit of folly and of malignity still prevails to a great extent, and that the spirit of Christianity has made little progress, even within the limits of the British empire.—The following late occurrence shows the fatal effects with which such practices are sometimes attended. "On Monday, February 28, 1825, two of the scholars at Eton, the Hon. F. A. Cooper, the son of the Earl of Shaftesbury, and Mr. Wood, the son of Colonel Wood, and nephew to the Marquis of Londonderry, in consequence of a very warm altercation on the play-ground, on the preceding day, met, for the purpose of settling the unhappy quarrel by a pugilistic encounter—a prevalent practice at Eton and all our public schools. Almost the whole school assembled to witness the spectacle. The inexperienced youth commenced fighting at four o'clock, and partly by their own energy, and partly by the criminal excitement of others, continued the fatal contest till within a little of six, when, mournful to relate, the Earl of Shaftesbury's son fell very heavily upon his head, and never spoke afterwards. He was carried off to his lodgings, where he expired in a few hours. On the coroner's inquest it came out, that brandy had been administered very freely, and that no decisive effort had been made to discontinue a contest prolonged beyond all due limits.—About forty years ago a similar cause led to a similar result at the same establishment. The survivor is a clergyman of great respectability."—*See the Public Prints for Feb. and Evan. Mag. for April, 1825.*

and to become a pest to his friends, and to general society. Our streets and highways are infested, and our jails and bridewells filled with young persons of this age, who, by means of rational and religious training, might have been rendered a comfort to their friends, blessings to society, and ornaments of the Christian Church.

It would be inconsistent with the limited plan of this work, to attempt to trace the principle of malignity through all the scenes of social, commercial, and domestic life. Were I to enter into details of filial impiety, ingratitude, and rebellion—of faithless friendships—of the alienations of affection, and of the unnatural contentions between brothers and sisters—of the abominable selfishness which appears in the general conduct and transactions of mankind—of the bitterness, the fraud, and the perjury, with which law-suits are commenced and prosecuted—of the hatred, malice, and resentment, manifested for injuries real or supposed—of the frauds daily committed in every department of the commercial world—of the shufflings and base deceptions which are practised in cases of bankruptcy—of the slanders, the caballing, and the falsehood, which attend electioneering contests—of the envy, malice, and resentment displayed between competitors for office and power—of the haughtiness and insolence displayed by petty tyrants both in church and state—of the selfishness and injustice of corporate bodies, and the little regard they show for the interests of those who are oppressed, and deprived of their rewards—of the gluttony, drunkenness, and prodigality, which so generally prevail—of the brawlings, fightings, and contentions, which are daily presented to the view in taverns, ale-houses, and dram-shops, and the low slang and vulgar abuse with which such scenes are intermingled—of the seductions accomplished by insidious artfulness and outrageous perjury—of the multiplied falsehoods of all descriptions which are uttered in courts, in camps, and in private dwellings—of the unblushing lies of public newspapers, and the perjuries of office—of the systematic frauds and robberies by which a large portion of the community are cheated out of their property and their rights—of the pride, haughtiness, and oppression of the rich, and of the malice, envy, and discontentment of the poor—such pictures of malignity might be presented to the view, as would fill the mind of the reader with astonishment and horror, and which would require a series of volumes to record the revolting details.

There is one very general characteristic of civilized, and even of Christian society, that bears the stamp of malignity, which may particularly be noticed; and that is, the pleasure with which men expatiate on the faults and delinquencies of their neighbours, and the eagerness with which they circulate scandalous reports through every portion of the community. Almost

the one half of the conversation of *civilized* men, when strictly analyzed, will be found to consist of malignant insinuations, and of tales of scandal and detraction, the one half of which is destitute of any solid foundation. How comes it to pass, that the slightest deviation from propriety or rectitude, in the case of one of a generally respectable character, is dwelt upon with a fiend-like pleasure, and aggravated beyond measure, while all his good qualities are overlooked and thrown completely into the shade? What is the reason why we are not as anxious to bring forward the good qualities and actions of our fellow-men, and to bestow upon them their due tribute of praise, as we are to blaze abroad their errors and infirmities? How often does it happen, that a single evil action committed by an individual, contrary to the general tenor of his life, will be trumpeted about by the tongue of malice, even to the end of his life, while all his virtuous deeds and praiseworthy actions will be overlooked and forgotten, and attempted to be buried in oblivion! If benevolence were the prevailing characteristic of mankind, such dispositions would seldom be displayed in the intercourse of human beings. If benevolence pervaded every heart, we would rejoice to expatiate on the *excellences* of others;—these would form the chief topics of conversation in our personal remarks on others; we would endeavour to throw a veil over the infirmities of our brethren, and would be always disposed to exercise that candour and charity “which covers a multitude of sins.”

If we now turn our eyes for a moment, to the *amusements* of civilized society, we shall find many of them distinguished by a malignant character and tendency. What an appropriate exhibition for rational and immortal beings do the scenes of a *cockpit* display! to behold a motley group of *bipeds*, of all sorts and sizes, from the peer to the chimney-sweep, and from the man of hoary hairs to the lisping infant, betting, blustering, swearing, and feasting their eyes with a savage delight on the sufferings of their fellow-bipeds, whom they have taught to wound, to torment, and to destroy each other! There is scarcely any thing that appears so congenial to the spirit which pervades the infernal regions, as the attempt to inspire the lower animals with the same malignant dispositions which characterize the most degraded of the human species. That such a cruel and disgusting practice still prevails in England, and that it formed, until lately, a part of the amusements of almost all the schools in Scotland, is a reproach to the civilization, the humanity, and the Christianity of our country. And what a fine spectacle to a humane and civilized mind is the amusement of *bull-baiting*! an amusement in which the strength and courage of this animal are made the means of torturing him with the most exquisite agonies! Can be-

nevolence, can even the common feelings of humanity, reside in the breast of that man who can find enjoyment in encouraging and in witnessing such barbarous sports? And what a dignified amusement is the *horse race*! where crowds of the nobility, gentry, and of the most polished classes of society, as well as the ignoble rabble, assemble from all quarters, to behold two noble animals panting, and heaving, and endeavouring to outstrip each other on the course! What scene of bullying, and jockeying, and betting and cheating, and cursing, and swearing, and fighting, is generally presented on such occasions! What a wonderful degree of importance is attached, by the most dignified rank of society, to the issue of the race; as if the fate of an empire, or the salvation of an immortal spirit, were depending on the circumstance of one horse getting a start of another! I do not mean to decry, indiscriminately, public amusements; nor to call in question the propriety of improving the locomotive powers of the horse; but, surely, it would require no great stretch of invention, to devise spectacles and entertainments, much more dignified and congenial to the noble powers, and to the high destination of the human mind, and which might be exhibited with as little expense either of time or of money.

And what shall we say of *lion fights*, and *dog fights*, and *boxing matches* between animals in the shape of men, which have been lately advertised in the public prints with so much impudence and effrontery? Are the patrons of such revolting exhibitions, and the crowds which resort to them, to be considered as patterns of taste, of humanity, and of refined benevolence? And what shall we think of the amusements of one half of our gentry, country squires, gentlemen farmers, and the whole tribe of the sporting community, who derive more exquisite enjoyment in maiming a hare, a partridge, or a moorfowl, than in relieving the wants of the friendless poor, in meliorating the condition of their dependants, or in patronising the diffusion of useful knowledge? If one of our best moral poets declared, that “he would not enter, on his list of friends, though graced with polished manners and fine sense, the man who needlessly sets foot upon a worm,” what would be his estimate of the man who derived one of his chief gratifications, day after day, from making havoc among the feathered tribes, and from lacerating and maiming a timid hare, for the sole purpose of indulging a sporting humour, and proving himself an excellent marksman? Can we suppose that the benevolent Creator so curiously organized the beasts of the earth and the fowls of heaven, and endowed them with exquisite feelings and sensibility, merely that tyrannical man might torture and destroy them for his *amusement*? For the persons to whom I allude cannot plead *necessity* for such conduct, as if they were dependant for subsistence on their

sarcasms. Such is still the mania for these cruel arguments, that the butchery of the brutal and the winged tribes, it is likely, will soon be reduced to a regular system, and enrolled among the number of the *fine arts*. For, an octavo volume, of 470 pages, which has already passed through three editions, has been lately published, entitled, "Instructions to young Sportsmen in all that relates to Game and Shooting:" by Lieut. Colonel Hawker. The author, after having stated that he has now lost his eyes and nerves for a good shot, says "The greatest pleasure that can possibly remain for me, is to resign the little I have learned for the benefit of young sportsmen. The rising generation of shooters might otherwise be left for many years, to find out all these little matters." And a most important loss, doubtless, the rising generation would have sustained, had not the worthy Colonel condescended to communicate his discoveries! I was lately making an excursion in a steam-boat, through one of the Scottish lakes. Among the passengers were several of the sporting gentry, furnished with all their requisite accoutrements, who seemed to enjoy a higher gratification in disturbing the happiness of the feathered tribes, than in contemplating the natural beauties of the surrounding scene. When any of these hapless animals appeared in view, a hue and cry commenced, a shot was prepared, and a musket levelled at the unoffending creatures, which created among them universal agitation and alarm. Some of them were killed; and others, doubtless, maimed, and rendered miserable for life; while no human being could enjoy the least benefit from such wanton cruelty. To kill, or even to maim any living creature that is doing us no harm, and when there is no possibility, nor even a desire, to procure its carcass for food, cannot, I should think, by any sophistry of reasoning, be construed into an act of benevolence.\*

I cannot, here, forbear inserting a passage from "Salt's Travels in Abyssinia," which exhibits a very different spirit in one whom some would be disposed to rank among the class of semi-barbarians. "In the evening, Baharnegash Yasons, a servant of the Ras (of Abyssinia) who had attended me during my whole stay in the country, took his leave. Among all the men

\* In throwing out these reflections, the author by no means wishes to insinuate, that it is improper, in every instance, to kill any of the inferior animals; his remarks being directed solely against the practice of wantonly maiming or destroying them for the sake of mere sport or amusement. Even in those cases where it may appear expedient or necessary, to extirpate a portion of the animal tribes, it appears somewhat strange, that *gentlemen* should be the voluntary agents employed in this work of destruction, and that their minds should be so much absorbed in the satisfaction which it creates. One would have thought that the very lowest class of the community would have been selected for this purpose, as there is something naturally revolting in the employment of destroying the life of any sensitive being.

with whom I have been intimately acquainted, I consider this old man as one of the most perfect and blameless characters. His mind seemed to be formed upon the purest principles of the Christian religion; his every thought and action appeared to be the result of its dictates. He would often, to ease his mule, walk more than half the day; and as he journeyed by my side, continually recited prayers for our welfare and future prosperity. On all occasions he sought to repress in those around him, every improper feeling of anger; conciliated them by the kindest words, and excited them, by his example, to an active performance of their duties. If a man were weary, he would assist him in carrying his burden; if he perceived any of the mules' backs to be hurt, he would beg me to have them relieved; and, constantly, when he saw me engaged in shooting partridges, or other birds, he would call out to them to fly out of the way, shaking his head, and begging me, in a mournful accent, not to kill them. I have remarked, in my former journal, that, with all this refined feeling of humanity, he was far from being devoid of courage; and, I had an opportunity, subsequently, of witnessing several instances of his bravery, though he appeared on all occasions peculiarly anxious to avoid a quarrel. We parted, I believe, with mutual regret; at least for my own part, I can truly say, that I have seldom felt more respect for an individual than I did for this worthy man."

As a contrast to the benevolent dispositions displayed by this worthy Abyssinian,—I shall give a short description of a *bull-fight*, in Madrid, extracted from a work, the author of which was a spectator (in 1803) of the scene he describes. "The Spanish bull-fights are certainly the most extraordinary exhibition in Europe: we were present at one of them this morning. The places in the amphitheatre were nearly all filled at half past nine, and at ten, the *corregidor* came into his box; upon which the trumpet sounded, and the people rose and shouted, from the delight that the show was to begin immediately. Four men in black gowns then came forward, and read a proclamation, enjoining all persons to remain in their seats. On their going out of the arena, the six bulls which were to be fought this morning, were driven across, led on by a cow, with a bell round her neck. The two *Picadores* (the men who were appointed to fight the furious animals) now appeared, dressed in leathern gaiters, thick leathern breeches, silk jackets covered with spangles, and caps surmounted by broad brimmed white hats; each rode a miserable hack, and carried in his hand a long pole, with a goad at the end. As soon as they were prepared, a door was opened, and the first bull rushed in. In the course of the contest, I felt first alarmed for the men, and then for the horses. Soon the accidents of the men withdrew my pity from the beasts; and, latterly, by a natural, and dreadful

operation of the mind, I began to look without horror on the calamities of both. The manner of the fight is thus:—the bull rushes in, and makes an attack severally upon the picadores, who repulse him; he being always, upon these occasions, wounded in the neck; after a few rencounters, he becomes somewhat shy; but at the same time, when he does rush on, he is doubly dangerous. He follows up the attack, and frequently succeeds in overthrowing both horse and rider. As long as the horse has strength to bear the picadore, he is obliged to ride him. This morning one of these wretched animals was forced to charge, *with his guts hanging in festoons between his legs!* His belly was again ripped open by the bull, and he fell for dead; but the attendants obliged him to rise and crawl out! This seems the cruellest part of the business; for the men almost always escape; but *the blood and sufferings of thirteen horses were exhibited in the short space of two hours.* Four men were hurt; one who was entirely overturned with his horse upon him, was carried out like a corpse; but the spectators, *totally disregarding this melancholy sight, shouted for his companion to renew the attack.* The bull after his first rage and subsequent fury during many rounds, begins to feel weakness, and declines further attacks on the horsemen. Upon this, a loud shout re-echoes through the theatre, and some of the attendants advance and stick his gored neck full of arrows which cause him to *writhe about in great torment.* When the efforts he makes under these sufferings have considerably spent his strength, the corregidor makes a motion with his hand, and the trumpets sound as a signal to the matador to despatch him. This is a service which requires great skill and bravery; for the madness of the bull, and the torture he endures, prompt him to destroy every one around. The matador advances with a red cloak in one hand, and a sword in the other. He enrages the bull with the cloak, till, at length getting opposite to him, he rushes forward, and the sword pierces his spinal marrow, or what is more common, is buried to the hilt in his neck; upon which he turns aside, at first moaning, but a torrent of blood gushes from his mouth; and he staggers round the arena, and falls. The trumpets sound; three mules, ornamented with ribbons and flags, appear, to drag the wretched victim out by the horns, and the horsemen to prepare for the attack of a fresh animal."

"In the evening the show began at half-past four, and ten bulls were brought forward. To tame them before the matador approached, a new expedient was resorted to, most infamously cruel, namely, the covering of the darts with sulphur and fireworks. The torments of these were so dreadful, that the animals whose strength was fresh, raged about terribly, so that the assistants were forced to use great agility to get from them.

There were many hair-breadth escapes, one of the animals in pursuit of a man, leaped the barrier of the arena, which is about eight feet high. A second bull was still more furious, and made more tremendous attacks. In one of these he pinned the man and horse against the barriers, got his horns under the horse, and lacerated him dreadfully; in a moment afterwards, he lifted him up, and threw the man with such force through one of the apertures, as to kill him on the spot. He was borne past the box in which we were with his teeth set, and his side covered with blood; the horse staggered out spouting a stream of gore from his chest. The remaining picador renewed the charge, and *another came in with shouts to take the dead man's place.* One of these had his horse's skin dreadfully ripped off his side, and when he breathed, *the entrails swelled out of the hole;* to prevent which, the rider got off and stuffed in his pocket handkerchief," &c.\*—"I have seen," says Bourgoing, "eight or ten horses torn, and their bellies ripped open, fall and expire in the field of battle. Sometimes these horses, affecting models of patience, of courage, of docility—present a spectacle, at which it may be allowable to shudder. You see them tread under their feet, their own bloody entrails, hanging out of their open sides, and still obey, for some time the hand that guides them."

Such are the amusements which, in Spain fascinate all ranks of the community, from the prince to the peasant. Young ladies, old men, servant girls, and people of all ages and all characters are present. The art of killing a bull, which seems exclusively to be the business of a butcher, is gravely discussed and exalted with transport, not only by the rabble, but by men of sense, and by women of delicacy. The day of a bull-fight is a day of solemnity for the whole canton. "The people come," says Bourgoing, "from ten and twelve leagues distance. The artisan who can with difficulty earn enough for his subsistence, has always sufficient to pay for the bull-fight. Woe to the chastity of a young girl whose poverty excludes her! The man who pays for her admittance, will be her first seducer. It is indeed a very striking sight, to see all the inhabitants assemble round the circus, waiting the signal for the fight, and *wearing in their exterior every sign of impatience.*" There is not a town in Spain, but what has a large square for the purpose of exhibiting bull-fights; and it is said, that even the poorest inhabitants of the smallest villages will often club together, in order to procure a cow or an ox, and fight them riding upon asses for want of horses.† Can a spirit of pure bene-

\* Travels through Spain and part of Portugal in 1808, Vol. 2. pp. 35—45. A more circumstantial account of these fights, and in perfect accordance with the above description, may be seen in Bourgoing's "Modern State of Spain," vol. II. pp. 346—360.

† It is said that these fights were prohibited in 1808 to the deep regret of the most numerous part of the

violence be general among a people addicted to such cruel and savage amusements ! And, need we wonder to find, that troops of lawless banditti are continually prowling among the mountains and forests of that country, committing murders and depredations ? One of the authors just now quoted, when alluding to banditti, and detailing the incidents which occurred on his route to Madrid, says, "In this country it is impossible to distinguish friends from foes, as all travellers go well armed. We met just here half a dozen horsemen, many of whom had swords and pistols, and we afterwards saw peasants riding on asses, armed in the same way. A few leagues further on, we met a strong detachment of cavalry patrolling the road, in consequence of a daring robbery, which had just been committed on a nobleman who was bringing his bride to court from Barcelona. He had a numerous retinue ; the banditti were twelve in number, and completely armed."

If we now take a cursory glance at our POPULAR LITERARY WORKS, and at several of our publications intended for the nursery, we shall find that a goodly portion of them is stamped with the character of frivolity and of malignity. When the young mind is just beginning to expand, instead of being irradiated with the beams of unadulterated truth, a group of distorted and unsubstantial images, which have no prototypes in nature, is presented to the view of the intellect, as the groundwork of its future progress in wisdom and knowledge. Instead of the simple and sublime precepts of Christian benevolence, the wild and romantic notions connected with chivalry, the superstitions of the dark ages, and the love of false heroism, and of military glory, are attempted to be indelibly riveted on the minds of the young. What else can be expected, when such legends and romances as the following, occupy the principal part of the nursery library ?—*Blue Beard* ; *Cinderella* ; *Tom Thumb* ; *Jack the Giant-Killer* ; *Valentine and Orson* ; *The Seven Champions of Christendom* ; *Robin Hood* ; *Goody Two-Shoes* ; *Puss in Boots* ; *Sinbad the Sailor* ; *Aladdin, or, the Wonderful Lamp* ; *Thalaba, or, the Destroyer* ; *The Blood-Red Knight* ; *The Maid and the Magpie* ; *Fairy Tales*, and a long list of similar tales and romances, equally improving and important ! Such works are published, even at the present time, not only in a Lilliputian size, to suit the lower ranks of the community, but in a style of splendour and elegance, calculated to fascinate the highest circles of society. Ten thousands of copies of such publications, are presently in circulation throughout every part of the British empire :—and what is the great object

nation ; but another entertainment, called *festa de novillos*, which is an image of the bull-fight, is still retained and it is not improbable, that, by this time, the true bull-fight has been again revived.

they are calculated to accomplish ? To exhibit distorted views of the scenes of nature, and of human society ; to foster superstitious notions ; to inspire the minds of the young with an inordinate desire after worldly honour and distinction ; to set before them, as an ultimate object, the splendour and felicity of "riding in a coach and six ;" and to familiarize their minds to chivalrous exploits, and to scenes of butchery and revenge.

If we glance at the popular literary works of the present day, intended for the amusement of children of a larger growth, we shall find many of them imbued with a similar spirit, and having a similar tendency. What is it that just now fascinates our literary loungers, our polished gentry, our educated females, nay, all ranks of the community, from the dignified clergyman to the humble weaver, and which threatens to destroy all relish for plain unvarnished facts, and for substantial knowledge ? The novels of *Waverley*, *Guy Mannering*, *Rob Roy*, *Tales of my Landlord*, *The Fortunes of Nigel*, *St. Roman's Well*, *Marmion*, *The Corsair*, *Childe Harold*, and a shoal of similar publications, which are daily issuing from the press. And what is the general tendency of the great majority of such works ? To distort and caricature the facts of real history ; to gratify a romantic imagination ; to pamper a depraved mental appetite ; to excite a disrelish for the existing scenes of nature, and for the authenticated facts which have occurred in the history of mankind ; to hold up venerable characters to derision and contempt ; to excite admiration of the exploits and the malignant principles of those rude chieftains and barbarous heroes ; whose names ought to descend into everlasting oblivion ; to revive the revengeful spirit of the dark ages ; to undermine a sacred regard for truth and moral principle, which are the basis of the happiness of the intelligent universe ; and to throw a false glory over scenes of rapine, of bloodshed, and of devastation.—To such works, and to their admirers, we might apply the words of the ancient Prophet : "He feedeth on ashes ; a deceived heart hath turned him aside, that he cannot say, Is there not a lie in my right hand ?"

"For, sure, to hug a fancied ease,  
That never did, nor can take place,  
And for the pleasures it can give,  
Neglect the 'facts of real life,'  
Is madness in its greatest height,  
Or I mistake the matter quite."—*Watts*.

To affirm, that it is necessary for the entertainment of the human mind, to have recourse to fictitious scenes and narratives, and to the wild vagaries of an unbridled imagination, is, in effect, to throw a reflection upon the plans and the conduct of the Creator. It implies, that, in the scenes of nature which surround us, both in the heavens and on the earth, and in the administrations of his moral government among men, God

has not produced a sufficient variety of interesting objects for the contemplation, the instruction, and the entertainment of the human race—and that the system of the moral and physical world must be distorted and deranged, and its economy misrepresented and blended with the creations of human folly, before its scenery be rendered fit to gratify the depraved and fastidious tastes of mankind.\* And is it indeed true, that there is not a sufficient variety to gratify a rational mind in the existing scenes of creation and providence? If we survey the Alpine scenes of nature; if we explore the wonders of the ocean; if we penetrate into the subterraneous recesses of the globe; if we direct our view to the numerous objects of sublimity and of beauty to be found in every country; if we investigate the structure and economy of the animal and the vegetable tribes; if we raise our eyes to the rolling orbs of heaven; if we look back to the generations of old, and trace the history of ancient nations; if we contemplate the present state of civilized and of savage tribes, and the moral scenery which is every where displayed around us—shall we not find a sufficient variety of every thing which is calculated to interest, to instruct, and to entertain a rational mind? I am bold to affirm, that were a proper selection made of the facts connected with the system of nature, and with the history and the present state of human society, and were the sketches of such facts executed by the hand of a master, and interspersed with rational and moral reflections—volumes might be presented to the public, no less entertaining, and certainly far more instructive, than all the novels and romances which the human imagination has ever produced; and that, too, without distorting a single fact in the system of nature or of human society, or exciting a sentiment of admiration or of approbation of the exploits of warriors. If we wish to be amused with entertaining narrations and novel scenes, the narratives of adventurous voyagers and travellers, when written with spirit

\* The following sketch of Sir Walter Scott, the supposed author of some of the works alluded to, is given in Hazlitt's "Spirit of the Age, or Contemporary Portraits." "His mind receives and treasures up every thing brought to it by tradition or custom—it does not project itself beyond this into the world unknown, but mechanically shrinks back as from the edge of a precipice. The land of pure reason is to his apprehension like *Van Dieman's Land*, barren, miserable, distant, a place of exile, the dreary abode of savages, convicts, and adventurers. Sir Walter would make a bad hand of a description of the millennium, unless he would lay the scene in Scotland 500 years ago; and then he would want facts and worm-eaten parchments to support his drooping style. Our historical novelist firmly thinks, that nothing is but what *has been*—that the moral world stands still, as the material one was supposed to do of old—and that we can never get beyond the point where we actually are, without utter destruction, though every thing changes and will change, from what it was 500 years ago and what it is now; from what it is now, to all that the bigoted admirer of the good old times most dreads and hates."

and animation, will supply us with entertainment scarcely inferior to that of the best written novel; and it is the reader's own fault, if he do not, from such sources, derive moral instruction. Such adventures as those of Mungo Park in Africa, and Captain Cochrane in Siberia, and such narratives as those of Byron, Brissot, Pierre Viaud, Anson, Cook, Bligh, Perouse, and others, abound with so many striking and affecting incidents, that the reader's attention is kept alive, and he feels as lively an interest in the fate of the adventurers, as is usually felt in that of the fictitious hero of a novel, or a romance.

If man were only the creature of a day, whose whole existence was confined within the limits of this sublunary scene, he might amuse himself either with facts or with fictions, or with any toys or gewgaws that happened to strike his fancy while he glided down the stream of time to the gulf of oblivion. But if he is a being destined for eternity, the train of his thoughts ought to be directed to objects corresponding to his high destination, and all his amusements blended with those moral instructions which have an ultimate reference to the scene of his immortal existence. When I read one of our modern novels, I enjoy, for a few hours, a transitory amusement, in contemplating the scenes of fancy it displays, and in following the hero through his numerous adventures; I admire the force and brilliancy of the imagination of the writer (for I am by no means disposed to underrate the intellectual talent which has produced some of the works to which I allude,) but when I have finished the perusal, and reflect, that all the scenes which passed before my mental eye, were only so many unsubstantial images, the fictions of a lively imagination—I cannot indulge in rational or religious reflections on the subject, nor derive a single moral instruction, any more than I can do from a dream or a vision of the night. When I survey the scenes of creation; when I read the history of ancient nations; when I peruse the authentic narratives of the voyager and traveller; when I search the records of revelation; and when I contemplate the present state of society around me,—I learn something of the character, the attributes, and the providence of God, and of the moral and physical state of mankind. From almost every scene, and every incident, I can deduce instructions calculated to promote the exercise of humility, meekness, gratitude, and resignation—to lead the mind to God as the source of felicity, and as the righteous governor of the world—and to impress the heart with a sense of the folly and depravity of man. But it is obvious, that no distinct moral instructions can be fairly deduced from scenes, circumstances, and events "which never did nor can take place."—Such however is, at present the tide of public opinion on this subject, that we

might as soon attempt to stem a mountain torrent by a breath of wind, or to interrupt the dashing of a mighty cataract by the waving of our hand, as to expect to counteract, by any considerations that can be adduced, the current of popular feeling in favour of novels, and tales of knights, and of tournaments; of warlike chieftains, and military encounters. Such a state of feeling, I presume, never can exist in a world where moral evil has never shed its malign influence.

Again, if we consider the sentiments and the conduct of many of our *Literary and Scientific characters*, we shall find that even philosophy has had very little influence, in counteracting the stream of malignity, and promoting the exercise of benevolence. Do not many of our literary characters in their disputes frequently display as keen resentments, and as malevolent dispositions, as the professed warrior, and the man of the world? and have they not some times resorted even to horsewhips and to pistols to decide their contests? In proof of this, need I refer to the gentlemen now or formerly connected with the "Edinburgh Magazine," "Blackwood's Magazine," the "London Magazine," the "Quarterly Review," and other periodical works—and to the mean jealousies and contentions which have been displayed, and the scurrilous paragraphs which have been written by various descriptions of competitors for literary fame? Such a display of temper and conduct in men of professed erudition, is not only inconsistent with moral principle, and the dignity of true science, but has a tendency to hold up philosophy and substantial knowledge to the scorn and contempt both of the Christian and of the political world.

Again, is it an evi-  
dence that benevolence forms a prominent character of modern civilized society, when philanthropists, who have devoted their substance and their mental activities to the promotion of the best interests of mankind; and when men of science, who have enlarged the sphere of our knowledge, and improved the useful arts, are suffered to pine away in penury and neglect, and to descend into the grave, without even a "frail memorial" to mark the spot where their mortal remains are deposited; while, on the warrior, who has driven the ploughshare of destruction through the world, and wounded the peace of a thousand families, enormous pensions are bestowed, and trophies erected to perpetuate his memory to future generations? And how comes it to pass, if benevolence and justice be distinguishing features of our age and nation, that authors, whose writings afford instruction and entertainment to a numerous public, are frequently suffered to pine away in anxiety and distress, and to remain in hopeless indigence, while publishers and booksellers are fattening on the fruit of their labours? Yet, while we leave them to remain in abject penury, during life,—no soon-

er have their spirits taken their flight into the world unknown, than subscriptions are set on foot, statues and mausoleums are erected, flattering inscriptions are engraved on their tombs, and anniversary dinners are appointed to celebrate their memories. Such displays of liberality might have been of essential benefit to the individuals, while they sojourned within the limits of this sublunary sphere; but they are altogether futile and superfluous in relation to the separate spirits, which are now placed forever beyond the reach of such vain pageantry and posthumous honours.

If we now attend, for a little, to the *Penal Codes* of civilized nations, we shall find them, not only glaringly deficient in a spirit of benevolence, but deeply imbued with a spirit of cruelty and revenge. The great object of all civil punishments ought to be, not only the prevention of crimes, but also the reformation of the criminal, in order that a conviction of the evil of his conduct may be impressed upon his mind, and that he may be restored to society as a renovated character. When punishments are inflicted with a degree of severity beyond what is necessary to accomplish these ends, the code which sanctions them, becomes an engine of cruelty and of injustice. But, the reformation, and the ultimate happiness of the criminal, never seem to have been once taken into consideration, in the construction of the criminal codes of any nation in Europe. The infliction of pain, and even of torture, and of every thing that is degrading and horrible, to a degree far beyond what is necessary for the security of the public, and which has no other tendency than to harden the culprit, seems to have been the great object of the framers of our penal statutes. If a man has committed an offence against society, he is either confined to a jail, thrown into a dungeon, loaded with irons, whipped through the streets, banished to a distant land, hung upon a gallows, or broken on the wheel. No system of moral regimen, calculated to counteract his criminal habits, to impart instruction to his mind, and to induce habits of industry and temperance, (except in a few insulated cases) has yet been arranged by our legislators, so as to render punishment a blessing to the criminal, and to the community which he has injured.

The following circumstances, in relation to punishments, manifest a principle both of folly and of malignity in the arrangements of our criminal jurisprudence.—In the first place, the present system of our prison discipline, instead of operating to prevent the increase of crime, has a direct and inevitable tendency to produce vice and wretchedness, and to render our jails the nurseries of every depraved propensity, and of every species of moral turpitude. From the indiscriminate association of the young and the old, and of persons charged with every degree of criminality, the youthful and inexperienced cul-

prison is soon tutored in all the arts of fraud, deception, and robbery, and prepared for acting a more conspicuous and atrocious part on the theatre of crime. "I make no scruple to affirm," says Mr. Howard, "that if it were the aim and wish of magistrates to effect the destruction, present and future, of young delinquents, they could not desire a more effectual method than to confine them in our prisons." Of the truth of this position, the reader will find an ample and impressive proof in the Honourable T. F. Buxton's "Inquiry whether crime and misery are produced or prevented by our present system of Prison Discipline."

In the second place, the disproportion between crimes and punishments, and the sanguinary character of every civilized code of penal statutes, are directly repugnant to every principle of justice and benevolence. The punishment assigned by the law to the man who steals a sheep, or pilfers a petty article of merchandise, is the same as that which it inflicts on the miscreant who has imbrued his hands in his father's blood. In France, prior to the revolution, the punishment of robbery, either with or without murder, was the same; and hence it happened, that robbery was seldom or never perpetrated without murder. For, when men see no distinction made in the nature and gradations of punishment, they will be generally led to conclude, that there is no distinction in the guilt. In our own country, it is a melancholy truth, that, among the variety of actions which men are daily liable to commit, no less than *one hundred and sixty* have been declared, by act of parliament, to be felonies, without benefit of clergy; or, in other words, to be worthy of instant death.\* It is an indelible disgrace to an age which boasts of its being enlightened with the beams of science and of religion, that laws, framed in an ignorant and barbarous age, and intended to apply to temporary or fortuitous occurrences, should still be acted upon, and stand unrepealed in the criminal codes of the nations of Europe, in the 19th century of the Christian era, when so many distinguished writers have demonstrated their futility, their injustice, and their inadequacy for the prevention of crime. For, instead of diminishing the number of offenders, experience proves, that crimes are almost uniformly increased by an undue severity of punishment. This was strikingly exemplified in the reign of Henry VIII. remarkable for the abundance of its crimes, which certainly did not arise from the mildness of punishment. In that reign alone, says his historian, *seventy-two thousand executions* took place, for robberies alone, exclusive of the religious murders which are known to have been numerous, —amounting, on an average, to *six executions a day*, Sundays included, during the whole reign of that monarch.

\* Ency Brit. Art. Crime

In the next place, the shocking and unnecessary cruelties which are frequently inflicted upon criminals, are inconsistent with every principle of reason and of justice, and revolting to every feeling of humanity. If the forfeiture of life ought, in any case, to be resorted to as the punishment of certain crimes, humanity dictates, that it should be accompanied with as little pain as possible to the unfortunate criminal. But man, even civilized man, has glutted his savage disposition by inventing tortures to agonize his fellow man, at which humanity shudders. It is not enough that a poor unfortunate wretch, in the prime of life, whom depravity has hurried to the commission of crime, should be deprived of his mortal existence,—his soul must be harrowed up at the prospect of the prolonged torments which he must endure, before his spirit is permitted to take its flight to the world unknown. Instead of simply strangling or beheading the unhappy criminal, his flesh must be torn with pincers, his bones dislocated, his hands chopped off, or his body left to pine away in exquisite torments, amidst devouring flames. In Sweden, murder is punished by beheading and quartering, after having previously chopped off the hand. In Germany, Poland, Italy, and other parts of the continent, it was customary, and, I believe, still is, in some places, to put criminals to death, by breaking them alive on the wheel. The following account is given, by a traveller, who was in Berlin, in 1819, of the execution of a man for murder, which shows that the execution of criminals, in Prussia, is frequently distinguished by a species of cruelty worthy of the worst days of the inquisition. Amidst the parade of executioners, officers of police, and other judicial authorities, the beating of drums, and the waving of flags and colours, the criminal mounted the scaffold. No ministers of religion appeared to gild the horrors of eternity, and to sooth the agonies of the criminal; and no repentant prayer closed his quivering lips. "Never," says the narrator, "shall I forget the one bitter look of imploring agony that he threw around him, as immediately on stepping on the scaffold, his coat was rudely torn from off his shoulders. He was then thrown down, the cords fixed round his neck, which were drawn until strangulation almost commenced. Another executioner then approached, bearing in his hands a heavy wheel, bound with iron, with which he violently struck the legs, arms, and chest, and lastly the head of the criminal. I was unfortunately near enough to witness his mangled and bleeding body still convulsed. It was then carried down for interment, and, in less than a quarter of an hour from the beginning of his torture, the corpse was completely covered with earth. Several large stones, which were thrown upon him, hastened his last gasp; he was mangled into eternity!"

In Russia, the severest punishments are fre-

quently inflicted for the most trivial offences. The *knout* is one of the most common punishments in that country. This instrument is a thong made of the skin of an elk or of a wild ass, so hard that a single stroke is capable of cutting the flesh to the bone. The following description is given by *Olearius* of the manner in which he saw the knout inflicted on eight men, and one woman, only for selling brandy and tobacco without a license. "The executioner's man, after stripping them down to the waist, tied their feet, and took one at a time on his back. The executioner stood at three paces distance, and, springing forward with the knout in his hand,—whenever he struck, the blood gushed out at every blow. The men had each twenty-five or twenty-six lashes; the woman, though only sixteen, fainted away. After their backs were thus dreadfully mangled, they were tied together two and two; and those who sold tobacco having a little of it, and those who sold brandy a little bottle put about their necks; they were then whipped through the city of Petersburg for about a mile and a half, and then brought back to the place of their punishment, and dismissed." That is what is termed the moderate knout; for when it is given with the utmost severity, the executioner, striking the flank under the ribs, cuts the flesh to the bowels; and, therefore, it is no wonder that many die of this inhuman punishment.—The punishment of the pirates and robbers who infest the banks of the Wolga, is another act of savage cruelty common to Russia. A float is built, whereon a gallows is erected, on which is fastened a number of iron hooks, and on these the wretched criminals are hung alive by the ribs. The float is then launched into the stream, and orders are given to all the towns and villages on the borders of the river, that none, upon pain of death, shall afford the least relief to any of these wretches. These malefactors sometimes hang, in this manner, three, four, and even five days alive. The pain produces a raging fever, in which they utter the most horrid imprecations, imploring the relief of water and other liquors.\* During the reign of Peter the Great, the robbers who infested various parts of his dominions, particularly the banks of the Wolga, were hung up in this manner by hundreds and thousands, and left to perish in the most dreadful manner. Even yet, the boring of the tongue, and the cutting of it out, are practised in this country as an inferior species of punishment. Such cruel punishments, publicly inflicted, can have no other tendency than to demoralize the minds of the populace, to blunt their natural feelings, and to render criminal characters still more desperate: and hence we need not wonder at

what travellers affirm respecting the Russians, that they are very indifferent as to life or death, and undergo capital punishments with unparalleled apathy and indolence.

Even among European nations more civilized than the Russians, similar tortures have been inflicted upon criminals. The execution of *Damiens*, in 1757, for attempting to assassinate Louis XV. King of France, was accompanied with tortures, the description of which is sufficient to harrow up the feelings of the most callous mind—tortures, which could scarcely have been exceeded in intensity and variety, although they had been devised and executed by the ingenuity of an infernal fiend. And yet, they were beheld with a certain degree of apathy by a surrounding populace; and even counsellors and physicians could talk together about the best mode of tearing asunder the limbs of the wretched victim, with as much composure as if they had been dissecting a dead subject, or carving a pullet. Even in Britain, at no distant period, similar cruelties were practised. Those who are guilty of high treason are condemned, by our law, "to be hanged on a gallows for some minutes; then cut down, while yet alive, the heart to be taken out and exposed to view, and the entrails burned." Though the most cruel part of this sentence has never been actually inflicted in our times, yet it is a disgrace to Britons that such a statute should still stand unrepealed in our penal code.—The practice, too, of *torturing* supposed criminals for the purpose of extorting a confession of guilt, was, till a late period, common over all the countries of Europe; and if I am not mistaken, is still resorted to, in several parts of the continent. Hence, Baron Bielfeld, in his "*Elements of Universal Erudition*," published in 1770, lays down as one of the branches of criminal jurisprudence, "*The different kinds of tortures for the discovery of truth*." Such a practice is not only cruel and unjust, but absurd in the highest degree, and repugnant to every principle of reason. For, as the Marquis Beccaria has well observed, "It is confounding all relations to expect that a man should be both the accuser and the accused, and that pain should be the test of truth; as if truth resided in the muscles and fibres of a wretch in torture. By this method, the robust will escape, and the feeble be condemned.—To discover truth by this method, is a problem which may be better resolved by a mathematician than a judge, and may be thus stated: *The force of the muscles and the sensibility of the nerves of an innocent person being given, it is required to find the degree of pain necessary to make him confess himself guilty of a given crime.*"†

\* See Hanway's "Travels through Russia and Persia"—Salmon's "Present State of all Nations," vol. 8. Guthrie's Geography, &c

† See Beccaria's "Essay on Crimes and Punishments," p. 52. 56. The following is a brief summary of the principal punishments that have been adopted by men, in different countries, for tormenting and destroying each other. Capital punishments—be

If the confined limits of the present work had admitted, I might have prosecuted these illustrations to a much greater extent. I might have traced the operations of malevolence in the practice of that most shocking and abominable traffic, the *Slave Trade*—the eternal disgrace of individuals and of nations calling themselves civilized. This is an abomination which has been encouraged by almost every nation in Europe, and even by the enlightened states of America. And although Great Britain has formally prohibited, by a law, the importation of slaves from Africa; yet, in all her West Indian colonies, slavery in its most cruel and degrading forms still exists; and every proposition, and every plan for restoring the negroes to their natural liberty, and to the rank which they hold in the scale of existence, is pertinaciously resisted by gentlemen planters, who would spurn at the idea of being considered as either infidels or barbarians. They even attempt to deprive these degraded beings of the chance of obtaining a happier existence in a future world, by endeavouring to withhold from them the means of instruction, and by persecuting their instructors. "In *Demerara* alone there are 76,000 immortal souls linked to sable bodies, while there are but 3,500 whites; and yet, for the sake of these three thousand whites, the seventy-six thousand, with all their descendants, are to be kept in ignorance of the way of salvation, for no other purpose than to procure a precarious fortune for a very few individuals out of their sweat and blood." Is such conduct consistent with the spirit of benevolence, or even with the common feelings of humanity?

heading, strangling, crucifixion, drowning, burning, roasting, hanging by the neck, the arm, or the leg; starving, sawing, exposing to wild beasts, rending asunder by horses drawing opposite ways, shooting, burying alive, blowing from the mouth of a cannon, compulsory deprivation of sleep, rolling on a barrel stuck with nails, cutting to pieces, hanging by the ribs, poisoning, pressing slowly to death by a weight laid on the breast; casting headlong from a rock, tearing out the bowels, pulling to pieces with red hot pincers, stretching on the rack, breaking on the wheel, impaling, flaying alive, cutting out the heart, &c. &c. &c. Punishments short of death have been such as the following. Fine, pillory, imprisonment, compulsory labour at the mines, galleys, highways, or correction-house; whipping, bastinading; mutilation by cutting away the ears, the nose, the tongue, the breasts of women, the foot, the hand; squeezing the marrow from the bones with screws or wedges, castration, putting out the eyes; banishment, running the gauntlet, drumming, shaving off the hair, burning on the hand or forehead; and many others of a similar nature. Could the ingenuity of the inhabitants of *Tophet* have invented punishments more cruel and revolting? Has any one of these modes of punishment a tendency to reform the criminal, and promote his happiness? On the contrary, have they not all a direct tendency to irritate, to harden, and to excite feelings of revenge? Nothing shows the malevolent dispositions of a great portion of the human race, in so striking a light, as the punishments they have inflicted on one another; for these are characteristic, not of insulated individuals only, but of *nations*, in their collective capacity.

I might have traced the same malignant principle, in the practice of a set of men denominated *wreckers*, who, by setting up false lights, allure mariners to destruction, that they may enrich themselves by plundering the wrecks—in the *warlike dispositions* of all the governments of Europe, and the enormous sums which have been expended in the work of devastation, and of human destruction, while they have refused to give the least direct encouragement to philanthropic institutions, and to the improvement of the community in knowledge and virtue—and in that spirit of tyranny, and thirst for despotic power, which have led them to crush the rising intelligence of the people, and to lend a deaf ear to their most reasonable demands. For, there is no government on this side of the Atlantic, so far as I know, that has ever yet formed an institution for promoting the objects of general benevolence, for counteracting the baleful effects of depravity and ignorance, and for enlightening the minds of the people in useful knowledge; or which has even contributed a single mite to encourage such institutions after they were set on foot by the people themselves. Knowledge is simply permitted to be diffused; it is never directly encouraged; its progress is frequently obstructed; and, in some instances, it is positively interdicted, as appears from the following barbarous edict, published in the year 1825.—"A royal Sardinian edict directs, that henceforth no person shall learn to read or write who cannot prove the possession of property above the value of 1500 livres, (or about 60*l.* sterling.) The qualification for a student is the possession of an income to the same amount."\* Such is the firm determination of many of the kings and princes of Europe to hold their subjects in abject slavery and ignorance; and such is the desperate tendency of proud ambition, that they will rather suffer their thrones to shake and totter beneath them, than give encouragement to liberal opinions, and to the general diffusion of knowledge.—But, instead of illustrating such topics in minute detail, I shall conclude this section by presenting a few miscellaneous facts, tending to corroborate several of the preceding statements, and to illustrate the moral state of the civilized world.

The following statement, extracted from "Neale's Travels through Germany, Poland, Moldavia, and Turkey," exhibits a faint picture of the state of morals in Poland. "If ever there was a country," says Mr. Neale, "where 'might constitutes right,' that country was Poland, prior to its partition." The most dreadful oppression, the most execrable tyranny, the most wanton cruelties were daily exercised by the nobles upon the unfortunate peasants.—Let us quote a few facts; they will speak volumes. A

\* *Hamburg Paper*, August, 1825

Polish peasant's life was held of the same value with one of his horned cattle; if his lord slew him, he was fined only 100 Polish florins, or 2l. 16s. sterling. If, on the other hand, a man of ignoble birth dared to raise his hand against a nobleman, death was the inevitable punishment. If any one presumed to question the nobility of a magnate, he was forced to prove his assertion, or suffer death; nay, if a powerful man chose to take a fancy to the field of his humbler neighbour, and to erect a landmark upon it, and if that landmark remained for three days, the poor man lost his possession. The atrocious cruelties that were habitually exercised, are hardly credible. A Masalki caused his hounds to devour a peasant who happened to frighten his horse. A Radzivil had the belly of one of his subjects ripped open, to thrust his feet into it, hoping thereby to be cured of a malady that had tormented him.

One of the most infallible signs of a degraded state of morals in any country, is the corrupt administration of justice. As specimens of Polish justice, Mr. Neale mentions the case of a merchant of Warsaw, whom it cost 1400 ducats to procure the conviction and execution of two robbers who had plundered him; and another case, still more flagrant, that of a peasant who had apprehended an assassin, and who, on taking him to the Staroste, was coolly dismissed with the prisoner, and the corpse of the murdered person which he had brought in his wagon; because he had not ten ducats—the fee demanded by the magistrate for his interference.—“During the reign of Stanislaus Poniatowsky, a petty noble having refused to resign to Count Thisenhaus his small estate, the Count invited him to dinner, as if desirous of amicably adjusting the affair; and whilst the knight, in the pride of his heart at such unexpected honour, assiduously plied the bottle, the Count despatched some hundreds of peasants with axes, ploughs, and wagons, ordering the village, which consisted only of a few wooden buildings, to be pulled down, the materials carried away, and the plough to be passed over the ground which the village had occupied. This was accordingly done. The nobleman, on his return home in the evening, could find neither road, house, nor village. The master and his servant were alike bewildered, and knew not whether they were dreaming or had lost the power of discrimination; but their surprise and agony were deemed so truly humorous, that the whole court was delighted with the joke!” How depraved must be the state of moral feeling, when the injustice inflicted upon fellow-creatures, and the miseries they endure, become the subjects of merriment and derision!—“The morals of the people of Poland,” says Mr. Neale, “were, and continue to be, nearly at the lowest point of debasement. Female chastity is a phenomenon; while the male sex are proportionally profligate. Drunkenness, gluttony, and sensuality, prevail

to a degree unknown in other countries in Europe.”

The following extract from Mr. Howison's “Foreign Scenes and Travelling Recreations,” will convey some idea of the state of morals in the island of Cuba. “Nothing can be worse,” says Mr. H., “than the state of society in Havana. The lower classes are all alike dissolute and unprincipled. Assassinations are so frequent that they excite little attention; and assault and robbery are matters of course, when a man passes alone and at night through a solitary quarter of the town. Several assassinations take place in the streets every week.” This depraved and lawless state of things may be ascribed to three causes: the inefficiency of the police; the love of gaming and dissipation which prevails among the lower orders; and the facility with which absolution of the greatest crimes may be obtained from the priests. In fact, the Catholic religion, as it now exists in Cuba, tends to encourage rather than to check vice. We shall suppose, for example, that a man makes himself master of 100 dollars by robbing or by murdering another; and that the church grants him absolution for half the sum thus lawlessly obtained; it is evident that he will gain 50 dollars by the whole transaction, and think himself as innocent as he was before he committed the crime. No man need mount the Havana scaffold, whatever be his crime, if he has the means of ministering to the rapacity of the church, and of bribing the civil authorities. A poor friendless criminal is executed in a few days after sentence is pronounced upon him; but a person of wealth and influence generally manages to put off capital punishment for a series of years, and at last get it commuted to fine and imprisonment. Of these depraved practices, Mr. Hewison states several striking examples.—Those statements of Mr. H. in reference to the moral state of Cuba, I find corroborated by a short account of this island in the Monthly Magazine for March, 1820, page 120. “They act here very frequently those sacred mysteries which so delighted our good forefathers. I have witnessed (says the writer) the triumph of the *Ave Maria*, a tragic-comedy, which closes with the sudden appearance, in the midst of a theatre, of a chivalrous worthy, mounted on a real horse, shaking at the end of a lance the bloody head of an infidel. This horrid exhibition excited a titter of enjoyment in all the spectators. The ladies, in particular, seemed to be highly entertained,—no fainting fits, no nervous attacks. How could a mere fiction agonize the blunt feelings of women, hardened by the spectacle of bull-fights, and almost every day meeting with the dead body of some human being who has been assassinated?”

There is no situation in which human beings can be placed, where we should more naturally expect the manifestation of benevolent affections,

than in those scenes of danger where all are equally exposed to deep distress, and where the exercise of sympathy and kindness is the only thing that can alleviate the anguish of the mind. When the prospect of immediate death, or of prolonged agonies even more dreadful than the simple pain of dissolution, is full before the mind, one should think that ferocious dispositions would be instantly curbed, and kindly affections begin to appear. Yet, even in such situations, it frequently happens, that feelings of malevolence and revenge, and all the depraved passions, are most powerfully excited to action. The following facts will tend to illustrate this remark. Mr. Byron was shipwrecked, in a violent storm on the coast of South America. A mountainous sea broke over the ship; she was laid on her beam ends; darkness surrounded them; nothing was to be seen but breakers all around; and every soul on board looked upon the present minute as his last. "So terrible was the scene of foaming breakers around us," says Mr. B. "that one of the bravest men we had could not help expressing his dismay at it, saying it was too shocking a sight to bear." Even in this dreadful situation, malignant passions began to appear; and, like the dashing waves around, to rage with unbounded violence. No sooner had the morning thrown a ray of light over the dismal gloom, and a faint glimpse of land was perceived, than many of the crew who, but a few minutes before, had shown the strongest signs of despair, and were on their knees praying for mercy, "grew extremely riotous, broke open every chest and box that was at hand, stove in the heads of casks of brandy and wine, and got so drunk that some of them were drowned on board, and lay floating about the decks for some days after." After the greater part, to the number of 150 persons, had got to shore—"the boatswain and some of the people would not leave the ship so long as there was any liquor to be got at; they fell to beating every thing to pieces that came in their way, and carrying their intemperance to the greatest excess, broke open chests and cabins for plunder that could be of no use to them. So earnest were they in this wantonness of theft, that one man had evidently been murdered on account of some division of the spoil, or for the sake of the share that fell to him, having all the marks of a strangled corpse." The same malignant dispositions were displayed, in numerous instances, during their abode on the desolate and barren island on which they had been thrown, notwithstanding the hunger, the rains, the cold, and the attacks of wild beasts to which they were all equally exposed.\*

There is, perhaps, no occurrence that has hap-

\* See Byron's "Narrative of the Loss of the Wager Man of War."

pened in modern times, which so strikingly displays the desperate malignity of human beings in the midst of danger, as the conduct of the crew of the Medusa Frigate, while tossing on the raft by which they endeavoured to save themselves, after that vessel had been shipwrecked. The Medusa was stranded, in the month of June, 1816, on the bank of Arguin, near the western coast of Africa. A raft was hastily constructed, which was but scantily supplied with provisions. There were five boats, which contained in all about 240 persons; and upon the raft, there embarked about 150 individuals. The boats pushed off in a line, towing the raft, and assuring the people on board that they would conduct them safely to land. They had not proceeded, however, above two leagues from the wreck, when they, one by one, cast off the tow lines, and abandoned the raft to its fate. By this time the raft had sunk below the surface of the water to the depth of three feet and a half, and the people were squeezed one against another, that it was found impossible to move; fore and aft they were up to the middle in water. Night at length came on; the wind freshened; the sea began to swell; about midnight the weather became very stormy, and the waves broke over them in every direction. Tossed by the waves from one end to the other, and sometimes precipitated into the sea; floating between life and death; mourning over their own misfortunes; certain of perishing, yet contending for the remains of existence with that cruel element which menaced to swallow them up—such was their situation till break of day, when a dreadful spectacle presented itself. Ten or twelve unhappy men, having their extremities jammed between the spars of the raft, had perished in that situation, and others had been swept away by the violence of the waves.—All this, however, was nothing to the dreadful scene which took place the following night. "Already," says the narrator, "was the moral character of the people greatly changed. A spirit of sedition spread from man to man, and manifested itself by the most furious shouts." Night came on; the heavens were obscured with thick clouds; the wind rose, and with it the sea; the waves broke over them every moment; numbers were swept away, and several poor wretches were smothered by the pressure of their comrades. Both soldiers and sailors resolved to sooth their last moments by drinking to excess; they became deaf to the voice of reason; boldly declared their intention of murdering their officers; and, cutting the ropes which held the rafts together, one of them seizing an axe, actually began the dreadful work. The officers rushed forward to quell the tumult, and the man with the hatchet was the first that fell—the stroke of a sabre terminated his existence. One fellow was detected secretly cutting the ropes, and was immediately thrown overboard; others destroyed the shrouds

and mauls; and the mast, destitute of support, immediately fell on a captain of infantry, and broke his thigh; he was instantly seized by the soldiers and thrown into the sea, but was saved by the opposite party. About an hour after midnight the insurrection burst forth anew. They rushed upon the officers like desperate men, each having a knife or a sabre in his hand; and such was the fury of the assailants, that they tore their flesh, and even their clothes with their teeth. There was no time for hesitation; a general slaughter took place, and the raft was strewn with dead bodies. On the return of day, it was found that, in the course of the preceding night of horror, *sixty-five* of the mutineers had perished, and two of the small party attached to the officers. A third night of horror approached, distinguished by the piercing cries of those whom hunger and thirst devoured; and the morning's sun showed them a dozen unfortunate creatures stretched lifeless on the raft. The fourth night was marked by another massacre. Some Spaniards and Italians conspired to throw the rest into the sea. A Spaniard was the first to advance with a drawn knife; the sailors seized him and throw him into the sea. The Italian seeing this, jumped overboard; the rest were mastered, and order was restored. But, before the ship *Argus* came to their relief, of the 150 that embarked on the raft, 15 unhappy creatures only remained, covered with wounds and bruises, almost naked, stripped of their skin, shrivelled with the rays of the sun, their eyes hollow, and their countenances savage.—Such are the dreadful effects of *malignity*, which produces more sufferings and fatal effects, than the most tremendous elements of nature!

A certain portion of the same spirit was lately displayed by several individuals on board of the *Kent East Indiaman*. In the midst of a most violent gale, in the Bay of Biscay, when the sea was running mountains high, this vessel, containing about 600 persons, took fire, in consequence of the spirits from a stoved cask having communicated with a lamp; and all hopes of safety became extinguished, till the ship *Cambria*, Captain Cooke, hove in sight. But the danger of passing from one ship to the other, in boats, in such a tempestuous sea, rendered the preservation of the passengers and crew in a degree doubtful. Yet, in the midst of the danger, the alarm and the anguish which accompanied this tremendous scene, we are told by the narrator, page 24, that "it is suspected that one or two of those who perished, must have sunk under the weight of their spoils; the same individuals having been seen eagerly plundering the *cuddy* cabins." And, a little afterwards, page 31, he adds: "Some time after the shades of night had enveloped us, I descended to the *cuddy* in quest of a blanket to shelter me from the increasing cold, and the scene of desolation that

there presented itself was melancholy in the extreme. The place, which only a few short hours before had been the seat of kindly intercourse, and of social gayety, was now entirely deserted, save by a few miserable wretches, who were either stretched in irrecoverable intoxication on the floor, or prowling about, like beasts of prey, in search of plunder."\*

The following is a short description of the moral character of the inhabitants of Carolina, and of one of the *amusements* of a people who boast of their liberty and their civilization,—as it is found in "*Morse's American Geography*." "The citizens of North Carolina who are not better employed, spend their time in drinking, or gaming at cards or dice, in cock-fighting, or horse-racing. Many of the interludes are filled up with a boxing match; and these matches frequently become memorable by feats of *gouging*. This *delicate* and *entertaining* diversion is thus performed: When two boxers are worried with fighting and bruising each other, they come, as it is called, to close quarters; and each endeavours to twist his fore-fingers in the ear-locks of his antagonist. When these are fast clenched, the thumbs are extended each way to the nose, and the eyes gently twined out of their sockets. The victor, for his expertness, receives shouts of applause from the sporting throng, while his poor eyeless antagonist is laughed at for his misfortune. In a country that pretends to any degree of civilization, one would hardly expect to find a prevailing custom of putting out the eyes of each other. Yet this more than barbarous custom is prevalent in both the Carolinas, and in Georgia among the lower class of people."—"Lord, what is man!" In a savage and a civilized state—in infancy and in manhood—in his games and diversions—in the instructions by which he is trained—in the remarks he makes upon his neighbours—in the sports and amusements in which he indulges—in his literary pursuits and lucubrations—in his system of rewards and

\* See a "Narrative of the Loss of the *Kent East Indiaman*, by fire, in the Bay of Biscay, on the 1st of March, 1825, by a Passenger," supposed to be Major Macgregor.—The humanity and intrepidity displayed, amidst the heart-rending scene which this narrative describes—by Captain Cobb of the *Kent*; by Messrs. Thompson, Fearon, Macgregor, and the other officers, and many of the soldiers; by Captain Cooke of the *Cambria*, his crew, and the Cornish miners—above all praise. Their benevolent and heroic conduct at that alarming crisis, is far more deserving of a public monument being raised for its commemoration, than that of many of our military heroes, in honour of whom so many trophies have been erected. If men, who have been instrumental in destroying the lives and the happiness of hundreds and of thousands, have pensions bestowed on them, and are exalted to posts of honour, surely those who have exerted their energies in preserving the lives of hundreds, and in preventing the anguish of thousands, ought not to be suffered to sink into oblivion, or to pass unrewarded. It is, I presume, one reason among others, why virtue is so little practised, that it is seldom rewarded according to its merit.

punishments—in his intercourses and contests with communities and nations—in his commercial transactions—in his judicial administrations—in the height of prosperity—and in scenes of danger, and of the deepest distress,—a principle of malignity is forever operating to destroy his comforts, and to undermine the foundation of his happiness!

The above sketches may suffice, in the mean time, as specimens of some of the prominent dispositions of that portion of the human race who have assumed to themselves the character of *civilized nations*. It will readily be admitted, by most of my readers, that the dispositions displayed in the instances I have selected, are all directly repugnant to the principle of benevolence recognised in the divine law, and tend to undermine the happiness of intelligent beings.—I shall now conclude with a very brief sketch of the conduct of Christians, and of Christian societies towards each other, and of the leading traits of character which appear in the religious world.

#### SECTION IV.

##### MORAL STATE OF THE PROFESSING CHRISTIAN WORLD.

I have already endeavoured to show, that Christianity is a religion of *love*; that its facts, its doctrines, and its moral precepts, are all calculated to promote “peace on earth,” and to form mankind into one affectionate and harmonious society. This glorious and happy effect, in the first instance, it actually produced. We are told, in the history of the Apostles, that the multitudes who were converted to the Christian faith, by the powerful sermons delivered by Peter on the day of Pentecost, had their malignant propensities subdued, and their minds animated with an ardent affection for each other; and, as a practical proof of the operation of this noble principle, “they had all things common, and sold their possessions and goods, and parted them to all, as every man had need.” During the early ages of Christianity, a goodly portion of the same spirit was manifested by the greater part of those who had enrolled themselves as the disciples of Christ. Even in the midst of the reproaches, and the severe persecutions to which they were subjected during the two first centuries of the Christian era, a meek and forgiving disposition, and a spirit of benevolence towards one another, and towards all men, distinguished them from the heathen around, and constrained even their enemies to exclaim, “Behold how these Christians love one another!”—But no sooner was the Christian Church amalgamated with the kingdoms of this world, in the reign of Constantine, than its native purity began to be tainted, and Pagan maxims, and worldly ambition began

to be blended with the pure precepts and the sublime doctrines of the Gospel. Many of its professed adherents, overlooking the grand practical bearings of the Christian system, began to indulge in vain speculations on its mysterious doctrines; to substitute a number of unmeaning rites and ceremonies in the room of love to God and to man; and even to prosecute and destroy all those who refused to submit to their opinions and decisions. Pride, and a desire of domination, usurped the place of meekness and humility; and the foolish mummeries of monastic superstition, and the austerities of the *Ascetics*, were substituted in the room of the active duties of justice and benevolence. Saints were deified; the power of the clergy was augmented; celibacy was extolled; religious processions were appointed; pilgrimages were undertaken to the tombs of the martyrs; monasteries and nunneries, without number, were erected; prayers were offered up to departed saints; the Virgin Mary was recognised as a species of inferior deity; the sign of the cross was venerated as capable of securing victory in all kinds of trials and calamities, and as the surest defence against the influence of malignant spirits; the bishops aspired after wealth, magnificence, and splendour; errors in religion were punished with civil penalties and bodily tortures; and the most violent disputes and contentions convulsed every section of the Christian world; while the mild and beneficent virtues of the religion of Jesus were either discarded, or thrown into the shade.

Of these, and similar dispositions and practices, details might be exhibited which would fill many volumes, and which would carry conviction to every impartial mind, that the true glory of Christianity was sadly tarnished and obscured, and its heavenly spirit almost extinguished amidst the mass of superstitious observances, of vain speculations, and of angry feuds and contentions. Millot, when adverting to the state of the Church in the days of Constantine and the succeeding emperors, justly remarks: “The disciples of Christ were inspired with mutual feuds, still more implacable and destructive than the factions which were formed for or against different emperors. The spirit of contention condemned by St. Paul became almost universal. New sects sprung up incessantly, and combated each other. Each boasted its apostles, gave its sophisms for divine oracles, pretended to be the depository of the faith, and used every effort to draw the multitude to its standard. The church was filled with discord; bishops anathematized bishops; violence was called in to the aid of argument, and the folly of princes fanned the flame which spread with so destructive rage. They played the theologists, attempted to command opinions, and punished those whom they could not convince. The laws against idolaters were soon extended to heretics; but what one emperor

proscribed as heretical, was to another sound doctrine. What was the consequence? The clergy, whose influence was already great at court, and still greater among the people, began to withdraw from the sovereign authority that respect which religion inspires. The popular ferments being heightened by the animosity of the clergy, prince, country, law, and duty, were no longer regarded. Men were Arians, Donatists, Priscillianists, Nestorians, Eutychians, Monotholites, &c., but no longer citizens; or rather, every man became the mortal enemy of those citizens whose opinions he condemned.—This unheard-of madness, for irreconcilable quarrels on subjects that ought to have been referred to the judgment of the Church, *never abated amidst the most dreadful disasters*. Every sect formed a different party in the state, and their mutual animosities conspired to sap its foundations.”\*

At the period to which these observations refer, it appears that two erroneous maxims generally prevailed, which tended to undermine the moral system of revelation, and which were productive of almost all the tumults, massacres, and disasters, which distinguished that era of the Christian church. These were, 1. That religion consists chiefly in the belief of certain abstract and incomprehensible dogmas, and in the performance of a multitude of external rites and ceremonies: and, 2. That all heresies or differences of opinion on religious points, ought to be extirpated by the strong arm of the civil power. Thus such maxims, nothing can be more repugnant to reason, more subversive of genuine morality, or more inconsistent with the spirit and genius of the Christian religion. And yet, to this very hour, they are recognised and acted upon by more than three fourths of the Christian world, notwithstanding the melancholy examples which history has furnished of their futility, and their pernicious tendency.—The narrow limits to which I am confined will permit me to state only two or three instances in reference to the period to which I allude.

Theodosius, one of the emperors, who commenced his reign in the year 379, and who received baptism during a dangerous distemper, in the second year of it, professed great zeal in favour of religion. By a law addressed to the people of Constantinople, he enacted, “That all subjects shall profess the catholic faith with regard to the articles of the Trinity; and that they who do not conform shall ignominiously be called heretics, until they shall feel the vengeance of God and our own, according as it shall please Divine providence to inspire us.” He declared apostates and Manicheans incapable of making a will, or receiving any legacy; and having pronounced them worthy of death, the people thought they had a right to kill them as proscribed per-

sons. He enacted a law, condemning to the flames *cousins german* who married without a special license from the emperor. He established *inquisitors* for the discovery of heretics. He drove the Manicheans\* from Rome as infamous persons, and, on their death, ordered their goods to be distributed among the people. Yet, with all this religious zeal, he, on one occasion, gave orders for a universal massacre at Thessalonica, because some persons of distinction had been killed in a sedition at the time of the races. The inhabitants were caused to assemble in the circus, under the pretence of an exhibition of games, and slaughtered without distinction of age. Seven thousand, according to some, and fifteen thousand according to others, the greatest part unquestionably innocent, were thus sacrificed to atrocious revenge.† Leo, another emperor, “commanded every person to be baptized, under pain of banishment, and made it capital to relapse into idolatry, after the performance of the ceremony;” just as if Christians could be made by a forced baptism, or by a law of the state. Such edicts clearly showed, that, whatever zeal princes or the clergy might manifest in favour of the Christian religion, they were grossly ignorant of its true spirit, and of the means by which its benevolent objects were to be accomplished.

As a specimen of the manner in which such edicts were sometimes carried into effect, the following instance may be stated. Hypatia, daughter of the celebrated Geometrician, Theon of Alexandria, exceeded her father in learning, and gave public lectures in Philosophy, with the greatest applause; nor was she less admirable for the purity of her virtue, joined to an uncommon beauty, and every accomplishment that could adorn human nature. But this excellent woman, *because she was a Pagan*, trusted by the magistrates and suspected to be active against St. Cyril, the bishop, became an object of detestation to the Christian multitude. A set of monks and desperadoes, headed by a priest, seized her in the open street, hurried her into a church, where they stripped her naked, tore her body with whips, cut her in pieces, and publicly burned her mangled limbs in the market place.‡ St. Cyril, who was suspected of having fomented this tragedy, had previously attacked the synagogues, and driven out the Jews; their goods were pillaged, and several persons perished in the tumult. Such conduct plainly demonstrates the tendency of the human mind, in every situation, to abuse power and authority, for the purposes of persecution and revenge; and shows us what false ideas the Christians of that period must have entertained of the God of Mercy: and how

\* The distinguishing characteristic of the Manicheans was, their recognising the doctrine of two independent and eternal principles, the one the author of all good, and the other the author of all evil.

† Millot's Ancient History, vol. II.

‡ Millot's Ancient Hist. vol. II.

\* Millot's Modern History, vol. I

soon they had forgotten the sufferings which their fathers had so lately endured, under the reign of the heathen emperors.

About this period, too, vain speculations about abstruse and incomprehensible subjects, occupied the attention of theologians, and engendered religious quarrels and disputes, which burst asunder the bonds of affection and concord. A play of words and vain subtleties, were substituted in place of clear conceptions and substantial knowledge, which, instead of directing the faculties of the human mind to their proper objects, tended only to darken the light of reason, and to introduce the long night of ignorance which soon succeeded. It was a prevailing madness among the Greek theologians, who were intractable in their opinions,—and it is too much the case with certain modern divines,—to dispute about incomprehensible mysteries, to render them more obscure by their attempts to explain them, and perpetually to revive the most dangerous contentions. The Arians rejected the Divinity of the Word, in order to maintain the unity of God;—the Nestorians denied that Mary is the mother of God, and gave two persons to Jesus Christ, to support the opinion of his having two natures;—the Eutychians, to maintain the unity of the person, confounded the two natures into one. This heresy became divided into ten or twelve branches; some of the sections maintaining that Jesus Christ was merely a phantom, or appearance of flesh, but no real flesh. The Monotholites maintained, that there was only one will in Christ, as they could not conceive two free wills to exist in the same person. Another sect maintained, that the body of Christ was *incorruptible*, and that from the moment of his conception, he was incapable of change, and of suffering. This chimera Justinian attempted to establish by an edict. He banished the Patriarch Eutychius, and several other prelates, who opposed his sentiments; and was proceeding to tyrannize over the consciences of men with more violence than ever, when death interposed, and transported him to another scene of existence.—In such vain and preposterous disputes as these, were the minds of professed Christians occupied, notwithstanding the perils with which they were then environed. Councils were held, to determine the orthodox side of a question; anathemas were thundered against those who refused to acquiesce in their decisions; princes interposed their authority, and the civil sword was unsheathed to compel men to believe what they could not understand;—while the substantial truths of religion were overlooked, and its morality disregarded.—“Religion,” says Millot, “inspires us with a contempt of earthly vanities, a detestation of vice, and indulgence for the frailties of our neighbour; invincible patience in misfortunes, and compassion for the unhappy; it inspires us with charity and heroic courage; and tends to

sanctify every action in common and social life. How sublime and comforting the idea it gives of the Divinity! What confidence in his justice and infinite mercy! What encouragement for the exercise of every virtue! Wherefore, then, such errors and excesses on religious pretences? It is because heresy, shooting up under a thousand different forms, incessantly startles the faith by subtleness and sophistry, by which almost the whole energy of men’s minds is absorbed in the contest. Disputes engender hatred; from hatred springs every excess; and virtue, exhausted with words and cabals, loses her whole power.”—How happy would it be, and how glorious for the cause of genuine Christianity, were the present generation of Christians to profit by the sad experience of the past!

As we advance in the history of the Christian church, through the middle ages, the prospect appears still more dark and gloomy. The human mind, at that period, appeared to have lost its usual energy, and its powers of discrimination; the light of reason seemed almost extinguished; sophisms, and absurdities of all kinds, were greedily swallowed; and superstition displayed itself in a thousand diversified forms. Morality was in a manner smothered under a heap of ceremonies and arbitrary observances, which acquired the name of devotion. Relics, pilgrimages, offerings, and pious legacies, were thought capable of opening the gate of heaven to the most wicked of men. The virgin Mary, and the souls of departed saints, were invoked; splendid churches were erected to their honour; their assistance was entreated with many fervent prayers: while the mediation of Jesus Christ was thrown into the shade, and almost disregarded. An irresistible efficacy was attributed to the bones of martyrs, and to the figure of the cross, in defeating the attempts of Satan, in removing all sorts of calamities, and in healing the diseases both of the body and of the mind. Works of piety and benevolence were viewed as consisting chiefly in building and embellishing churches and chapels in endowing monasteries; in hunting after the relics of martyrs; in procuring the intercession of saints, by rich oblations; in worshipping images. in pilgrimages to holy places; in voluntary acts of mortification; in solitary masses; and in a variety of similar services, which could easily be reconciled with the commission of the most abominable crimes. So that the worship of “the God and Father of our Lord Jesus Christ,” was exchanged for the worship of bones, hair, fragments of fingers and toes, tattered rags, images of saints, and bits of rotten wood, supposed to be the relics of the cross. The dubbing of saints became a fruitful source of frauds and abuses throughout the Christian world; lying wonders were invented, and fabulous histories composed, to celebrate exploits that were never performed, and to glorify persons that never had a being.

and absolution from the greatest crimes could easily be procured, either by penance, or by money.

The absurd principle, that Religion consists in acts of *austerity*, produced the most extravagant behaviour in certain devotees, and reputed saints. They lived among the wild beasts; they ran naked through the lonely deserts, with a furious aspect, and with all the agitations of madness and frenzy; they prolonged their wretched lives, by grass and wild herbs; avoided the sight and conversation of men, and remained almost motionless for several years, exposed to the rigour and inclemency of the seasons;—and all this was considered as an acceptable method of worshipping the Deity, and of attaining a share in his favour.—But of all the instances of superstitious frenzy, which disgraced those times, none was held in higher veneration than that of a certain order of men, who obtained the name of *Pillar saints*. These were persons of a most singular and extravagant turn of mind, who stood motionless on the tops of pillars, expressly raised for this exercise of their patience, and remained there for several years, amidst the admiration and applause of a stupid and wondering populace. This strange superstitious practice began in the fifth century, and continued in the East for more than six hundred years.—To the same principle are to be attributed the revolting practices of the *Flagellants*, a sect of fanatics who chastised themselves with whips in public places. Numbers of persons of this description, of all ages and sexes, made processions, walking two by two, with their shoulders bare, which they whipped till the blood ran down in streamlets; in order to obtain mercy from God, and appease his indignation against the wickedness of the age. They held, among other things, that flagellation was of equal virtue with baptism, and the other sacraments; that the forgiveness of all sins was to be obtained by it, without the merits of Jesus Christ; that the old law of Christ was soon to be abolished, and that a new law, enjoining the baptism of blood, to be administered by whipping, was to be substituted in its place.

The enormous power conferred on the ministers of religion was another source of immorality and of the greatest excesses. The pope and the clergy reigned over mankind without control, and made themselves masters of almost all the wealth of every country in Europe. They were immersed in crimes of the deepest dye; and the laity, imagining themselves able to purchase the pardon of their sins for money, followed the example of their pastors without remorse. The most violent contentions, animosities, and hatred, reigned among the different orders of monks, and between the clergy of all ranks and degrees. “Instead of consecrating ecclesiastical censures solely to spiritual purposes, they converted them into a weapon for defending their privileges, and supporting their pretensions. The priesthood,

which was principally designed to bless, was most frequently employed in *cursing*. Excommunication was made the instrument of *damning*, instead of saving souls, and was inflicted according to the dictates of policy or of revenge.” The great and the noble, and even kings and emperors, were excommunicated, when it was designed to rob, or to enslave them; and this invisible engine, which they wielded with a powerful and a sovereign hand, was used to foment dissensions between the nearest relatives, and to kindle the most bloody wars. The generality of priests and monks kept wives and concubines, without shame or scruple, and even the papal throne was the seat of debauchery and vice. The possessions of the church were either sold to the highest bidder, or turned into a patrimony for the bastards of the incumbents. Marriages, wills, contracts, the interests of families and of courts, the state of the living and the dead, were all converted into instruments for promoting their credit, and increasing their riches. It was, therefore, a necessary result from such a state of things, that vices of every description abounded, that morals were ruined, and that the benevolence of the divine law was trampled under foot.

The *theological speculations* in which they indulged, corresponded to the degrading practices to which I have adverted, and tended to withdraw the mind from the substantial realities both of science and of religion. Sophisms and falsehoods were held forth as demonstrations. They attempted to argue after they had lost the rules of common sense. The cultivation of letters was neglected; eloquence consisted in futile declamations; and philosophy was lost in the abyss of scholastic and sophistical theology. “They attempted to penetrate into mysteries, and to decide questions which the limited faculties of the human mind are unable to comprehend or to resolve;” and such vain speculations they endeavoured to incorporate into the system of religion, and to render theology a subject of metaphysical refinement, and of endless controversy. A false logic was introduced, which subtilized upon words, but gave no idea of *things*; which employed itself in nice and refined distinctions concerning objects and operations which lie beyond the reach of human understanding, which confounded every thing by attempting to analyze every thing, and which opened an arena for men of fiery zeal to kindle the flame of controversy, and to give birth to numerous heresies. The following are a few instances, out of many, which might be produced, of the questions and controversies which occupied the attention of bishops and seraphical doctors, and gave rise to furious contentions:—Whether the conception of the Blessed Virgin was immaculate? Whether Mary should be denominated the Mother of God, or the Mother of Christ? Whether the bread and wine used in the eucharist were digested?

In what manner the *will* of Christ operated, and whether he had *one* will or *two*? Whether the Holy Ghost proceeded from the Father and Son, or only from the Father? Whether leavened or unleavened bread ought to be used in the eucharist? Whether souls in their intermediate state see God, or only the human nature of Christ? It was disputed between the Dominicans and the Franciscans, *Whether Christ had any property*? The Pope pronounced the negative proposition to be a pestilential and blasphemous doctrine, subversive of catholic faith. Many councils were held at Constantinople, to determine what sort of light it was the disciples saw on Mount Tabor: it was solemnly pronounced to be the eternal light with which God is encircled; and which may be termed his energy or operation, but is distinct from his nature and essence. The disputes respecting the real presence of Christ in the eucharist, led to this absurd conclusion, which came to be universally admitted—"That the substance of the bread and wine used in that ordinance is changed into the real body and blood of Christ;" and consequently, when a man eats what has the appearance of a wafer, he really and truly *eats the body and blood, the soul and divinity of Jesus Christ*; and when he afterwards drinks what has the appearance of wine, he drinks the very same body and blood, soul and divinity, which, perhaps, not a minute before, he had *wholly and entirely eaten*!—At the period to which I now allude, the *authenticity of a suspected relic* was proved by bulls—councils assembled and decided upon the authority of forged acts with regard to *the antiquity of a saint*, or the place where his body was deposited; and a bold impostor needed only to open his mouth, to persuade the multitude to believe whatever he pleased. To feed upon animals strangled or unclean, to eat flesh on Tuesday, eggs and cheese on Friday, to fast on Saturday, or to use unleavened bread in the service of the mass—were, by some, considered as indispensable duties, and by others, as vile abominations. In short, the history of this period is a reproach to the human understanding; an insult offered to the majesty of reason and of science, and a libel on the benevolent spirit which breathes through the whole of the Christian system.\*

\* As a striking instance of the folly and imbecility of the human mind at this period, it may be noticed, that in several churches in France they celebrated a festival in commemoration of the Virgin Mary's flight into Egypt, which was called the *Fest of the ass*. A young girl richly dressed, with a child in her arms, was set upon an ass richly caparisoned. The ass was led to the altar in solemn procession. High mass was said with great pomp. The ass was taught to kneel at proper places; a hymn, no less childish than impious, was sung in his praise; and when the ceremony was ended, the priest, instead of the usual words with which he dismissed the people, *brayed three times like an ass*, and the people, instead of the usual response, "We bless the Lord," *brayed in the same manner*. This ridiculous ceremony was

Nothing can be conceived more directly repugnant to the benevolence which the religion of Jesus inculcates, than the temper and conduct of those who arrogated to themselves the character of being God's viceregents on earth, and who assumed the supreme direction and control of the Christian church. In persons who laid claim to functions so sacred and divine, it might have been expected, that the appearance at least, of piety, humility, and benevolence, would have been exhibited before the eyes of the Christian world. But the history of the popes and their satellites, displays almost every thing which is directly opposed to such heavenly virtues. Their avarice, extortion, and licentiousness, became intolerable and excessive almost to a proverb. To extend their power over the kingdoms of this world, to increase their wealth and revenues, to live in opulence and splendour, to humble kings, to alienate the affections of their subjects, and

not a mere farcical entertainment; but *an act of devotion*, performed by the ministers of religion, and *by the authority of the church*.—Robertson's History of Charles V. vol. I.—In accordance with such ceremonies were the ideas which prevailed of the foolish qualifications requisite to constitute a good Christian. "He is a good Christian," says St. Eloy, a canonized saint of the Romish church, "who comes frequently to church; who presents the oblation offered to God upon the altar; who doth not taste of the fruits of his own industry until he has consecrated a part of them to God; who when the holy festivals approach, lives chastely even with his own wife during several days, that with a safe conscience he may draw near to the altar of God; and who, in the last place, can repeat the Creed and the Lord's prayer. Redeem, then, your souls from destruction, while you have the means in your power; offer presents and tithes to churchmen; come more frequently to church; humbly implore the patronage of the saints; for if you observe these things, you may come with security in the day of retribution to the tribunal of the eternal Judge, and say, 'Give to us, O Lord, for we have given unto thee.'"—Here we have an ample description of a good Christian, in which there is not the least mention of the love of God, of resignation to his will, obedience to his laws, or of justice, benevolence, or charity towards men.—*Mosheim's Church History*.

The following are the terms in which Tetzel and his associates describe the benefit of *indulgences*, about the beginning of the 16th century, a little before the era of the reformation. "If any man," said they, "purchase letters of indulgence, his soul may rest secure with respect to its salvation. The souls confined in purgatory, for whose redemption indulgences are purchase, as soon as the money tinkles in the chest, instantly escape from that place of torment, and ascend into heaven. The efficacy of indulgences were so great, that the most heinous sins, even if one should violate (which was impossible) the Mother of God, would be remitted and expiated by them, and the person be free both from punishment and guilt. That this was the unspeakable gift of God, in order to reconcile men to himself. That the cross erected by the preachers of indulgences, was as efficacious as the cross of Christ itself. Lo! the heavens are open, if you enter not now, when will you enter? For twelve pence you may redeem the soul of your father out of purgatory: and are you so ungrateful that you will not rescue your parent from torment? If you had but one coat, you ought to strip yourself instantly and sell it, in order to purchase such benefits," &c.—Robertson's Charles V. vol. II.

to riot in the lap of luxury and debauchery, seemed to be the great objects of their ambition. Instead of acting as the heralds of mercy, and the ministers of peace, they thundered anathemas against all who called in question their authority, kindled the flames of discord and of civil wars, armed subjects against their sovereigns, led forth hostile armies to the battle, and filled Europe with confusion, devastation, and carnage. Instead of applying the mild precepts of Christianity, and interposing the authority they had acquired for reconciling enemies, and subduing the jealousies of rival monarchs, they delighted to widen the breach of friendship, and to fan the flame of animosity and discord. Dr. Robertson, when adverting to the personal jealousies of Francis I. and Charles V. remarks, "If it had been in the power of the Pope to engage them in hostilities, without rendering Lombardy the theatre of war, nothing would have been more agreeable to him than to see them waste each other's strength in endless quarrels."\* The Son of man came into the world, not to destroy men's lives, but to save them; but, in such instances, we behold his pretended vicars, preparing and arranging the elements of discord, laying a train for the destruction of thousands and tens of thousands, and taking a diabolical delight in contemplating the feuds, the massacres, and the miseries which their infernal policy had created. The decrees of the papal throne, instead of breathing the mildness and benevolence of Jesus, became thundering curses, and sanguinary laws, and a set of frantic enthusiasts, or a lawless banditti, were frequently appointed to carry them into effect.

Not contented with the insurrections and the desolations they had produced among the European nations, they planned an expedition for the purpose of massacring the inhabitants of Asia, and ravaging their country. Urban II. about A. D. 1095, travelled from province to province, levying troops, even without the consent of their princes; preaching up the doctrine of "destruction to the infidels;" and commanding the people, in the name of God, to join in the *holy war*. St. Bernard ran from town to town haranguing the multitude, performing pretended miracles, and inducing all ranks, from the emperor to the peasant, to enrol themselves under the banners of the cross. Peter the Hermit, a man of a hideous figure and aspect, covered with rags, walking barefooted, and speaking as a prophet, inspired the people every where with an enthusiasm similar to his own. Thousands of wicked and abandoned debauchees were thus collected; bishops, priests, monks, women and children, were all enrolled in the holy army. A plenary absolution of all their sins was promised: and if they died in the contest, they were assured of a crown of martyrdom in the world to come. With hearts burning with fury and revenge, this army of banditti, without

discipline or provisions, marched in wild confusion through the eastern parts of Europe, and, at every step of their progress, committed the most dreadful outrages. So inveterate was their zeal against the Jews, wherever they were found, that many of those unfortunate beings, both men and women, murdered their own children, in the midst of the despair to which they were driven by these infuriated madmen; and when they arrived at Jerusalem, and had taken that city by assault, they suffered none of the infidels to escape the slaughter. Such was the way in which the successors of the Apostle Peter displayed their general benevolence, and their love to the souls and bodies of men.

The establishment of the *Inquisition*, is another mode in which the tyranny and cruelty of the Romish church has been displayed. This court was founded in the 12th century, by Father Dominic, and his followers, who were sent by Pope Innocent III. with orders to excite the Catholic princes and people to extirpate heretics. It is scarcely possible to conceive any institution more directly opposed to the dictates of justice and humanity, to the genius of Christianity, and to the meekness and gentleness of Christ, than this infernal tribunal. The proceedings against the unhappy victims of this court, are conducted with the greatest secrecy. The person granted them as counsel is not permitted to converse with them, except in the presence of the Inquisitors; and, when they communicate the evidence to the accused persons, *they carefully conceal from them the names of the authors*. The prisoners are kept for a long time, till they themselves, through the application of the *torture*, turn their own accusers; for they are neither told their crime, nor confronted with witnesses. When there is no shadow of proof against the pretended criminal, he is discharged, after suffering the most cruel tortures, a tedious and dreadful imprisonment, and the loss of the greatest part of his effects. When he is convicted and condemned, he is led in procession, with other unfortunate beings, on the festival of the *Auto da fe*, to the place of execution. He is clothed with a garment, painted with flames, and with his own figure, surrounded with dogs, serpents, and devils, all open-mouthed, as if ready to devour him. Such of the prisoners as declare that they die in the communion of the church of Rome, are first strangled, and then burned to ashes. Those who die in any other faith, are burned *alive*. The priests tell them, that they leave them to the devil, who is standing at their elbow, to receive their souls, and carry them with him into the flames of hell. Flaming furzes, fastened to long poles, are then thrust against their faces, till their faces are burned to a coal, which is accompanied with the loudest acclamations of joy, among the thousands of spectators. At last fire is set to the furze at the bottom of the

\* Robertson's Charles V. vol. II.

stake, over which the criminals are chained so high, that the top of the flame seldom reaches higher than the seat they sit on; so that they seem to be roasted rather than burned. There cannot be a more lamentable spectacle; the sufferers continually cry out, while they are able, "Pity, for the love of God;" yet it is beheld by all sexes and ages, with transports of joy and satisfaction; and even the monarch, surrounded by his courtiers, has sometimes graced the scene with his presence, imagining that he was performing an act highly acceptable to the Deity!!\*

And what are the heinous crimes for which such dreadful punishments are prepared? Perhaps nothing more than reading a book which has been denounced as heretical by the holy office, such as "Raynal's History of the Indies,"—assuming the title of a freemason—irritating a priest or mendicant friar—uttering the language of freethinkers—declaiming against the celibacy of the clergy—insinuating hints or suspicions respecting their amours and debaucheries—or throwing out a joke to the dishonour of the Virgin Mary,†—or, at most, holding the sentiments of a Mahometan, of a Jew, or the followers of Calvin or Luther. In the year 1725, the Inquisition discovered a family of Moors at Grenada, peaceably employed in manufacturing silks, and possessing superior skill in the exercise of this profession. The ancient laws, supposed to have fallen into disuse, were enforced in all their rigour, and *the wretched family was burnt alive.*‡ On the entry of the French into Toledo, during the late Peninsular war, General Lasalle visited the palace of the Inquisition. The great number of instruments of torture, especially the instruments to stretch the limbs, and the drop-baths, which cause a lingering death, excited horror, even in the minds of soldiers hardened in the field of battle. One of these instruments, singular in its kind for refined torture, and disgraceful to humanity and religion, deserves particular description. In a subterraneous vault adjoining to the audience chamber, stood, in a recess in the wall, a wooden statue made by the hands of monks, representing the Virgin Mary. A gilded glory beamed round her head, and she held a standard in her right hand. Notwithstanding the ample folds of the silk garment which fell from her shoulders on both sides, it appeared that she wore a breastplate; and,

upon a closer examination, it was found, that the whole front of the body was covered with extremely sharp nails, and small daggers, or blades of knives, with the points projecting outwards. The arms and hands had joints, and their motions were directed by machinery, placed behind the partition. One of the servants of the Inquisition was ordered to make the machine manœuvre. As the statue extended its arms, and gradually drew them back, as if she would affectionately embrace, and press some one to her heart, the well-filled knapsack of a Polish grenadier supplied for this time the place of the poor victim. The statue pressed it closer and closer; and when the director of the machinery made it open its arms and return to its first position, the knapsack was pierced two or three inches deep, and remained hanging upon the nails and daggers of the murderous instrument.

This infamous tribunal is said to have caused, between the years 1481 and 1759, 34,658 persons to be burnt alive; and between 1481 and 1806, to have sentenced 288,214 to the galleys, or to perpetual imprisonment.\* In the *Auto* of Toledo, in February, 1501, 67 women were delivered over to the flames for Jewish practices. The same punishment was inflicted on 900 females for being *witches*, in the Dutchy of Lorraine, by one Inquisitor alone. Under this accusation, upwards of *thirty thousand women* have perished by the hands of the Inquisition.† Torquemada, that infernal inquisitor of Spain, brought into the Inquisition, in the space of 14 years, no fewer than 80,000 persons; of whom 6000 were condemned to the flames, and burned alive with the greatest pomp and exultation; and, of that vast number, there was perhaps not a single person who was not more pure in religion, as well as morals, than their outrageous persecutors.‡—Has the Deity, then, whom the Inquisition professes to serve, such a voracious appetite for the blood of human victims? Has that benevolent Being, who maketh his sun to cheer the habitations of the *wicked* as well as of the righteous, and whose "tender mercies are over all his works"—commissioned such bloodthirsty monsters to act as his ministers of vengeance, and to torment and destroy the rational creatures he has formed? The very thought is absurd and *blasphemous* in the highest degree. All his beneficent operations in creation around us, and all the gracious promises and declarations of his word, stand directly opposed to such hellish practices, and condemn the perpetrators as audacious rebels against the divine government, and as nuisances in the universe of God.

The numerous *Massacres* which, in different ages, have taken place, on account of religious

\* See Ency. Brit. Art. *Act of faith*, and *Inquisition*, and Bourgoing's "Modern state of Spain," Vol. I. The "Instructions for the office of the holy Inquisition given at Tobda in 1561," may be seen in the *Appendix* to "Peyron's Essays on Spain," which forms the fourth volume of Bourgoing's work.

† The Chevalier de St. Gervais, was imprisoned in the Inquisition on the following occasion.—A mendicant having come to his chamber, with a purse, begged him to contribute something for the lights or tapers to be lighted in honour of the Virgin, he replied, "My good father, the Virgin has no need of lights, she need only go to bed at an earlier hour."

‡ Kalm's Sketches, Vol. IV.

epitaphs, is another revolting and melancholy trait in the character of the professed votaries of the Christian cause. Of these, the massacre of the Protestants in France on the feast of St. Bartholomew, on the 24th August, 1572, was perhaps, one of the most diabolical acts of perfidy, injustice, and cruelty, which have stained the character of our race. Every thing was atrocious and horrible in this unexampled conspiracy and assassination; feelings of the most sacred nature were annihilated; religious zeal was changed into an impious frenzy; and filial piety degenerated into sanguinary fury. Under the direction of the infamous Duke of Guise, the soldiers and the populace *en masse*, at the signal of the tolling of a bell, flew to arms, seizing every weapon that presented itself; and then rushing in crowds to every quarter of the city of Paris,—no sound was heard but the horrible cry, *Kill the Huguenots!* Every one suspected of being a Calvinist, without any distinction of rank, age, or sex, was indiscriminately massacred. The air resounded with the horrid cries and blasphemous imprecations, of the murderers, the piercing shrieks of the wounded, and the groans of the dying. Headless trunks were every instant precipitated from the windows into the court-yards, or the streets; the gate-ways were choked up with the bodies of the dead and dying, and the streets presented a spectacle of mangled limbs, and of human bodies, dragged by their butchers in order to be thrown into the Seine. Palaces, hotels, and public buildings, were reeking with blood; the image of death and desolation reigned on every side, and under the most hideous appearances; and in all quarters, carts were seen loaded with dead bodies, destined to be cast into the river, whose waters were for several days sullied by tides of human gore. The infuriated assassins, urged on by the cry, that “It was the king’s will that the very last of this race of vipers should be crushed and killed,” became furious in the slaughter; in proof of which, one Cruce, a jeweller, displaying his naked and bloody arm, vaunted aloud, that he had cut the throats of more than 400 Huguenots in one day. During this horrid period, every species of the most refined cruelty became exhausted; the weakness of infancy proved no impediment to the impulse of ferocity; children of ten years, exercising the first homicidal deed, were seen committing the most barbarous acts, and cutting the throats of infants in their swaddling clothes! the number of victims thus slaughtered in the city of Paris, amounted to above six thousand; and, in the provinces, at the same time, there perished about sixty thousand souls. And, what is still more shocking, the news of this massacre was welcomed at Rome with the most lively transports of joy. The Cardinal of Lorraine gave a large reward to the courier: and interrogated him upon the subject, in a manner that de-

monstrated he had been previously aware of the intended catastrophe. The cannons were fired, bonfires were kindled, and a solemn mass was celebrated, at which Pope Gregory XIII. assisted, with all the splendour which that court is accustomed to display on events of the most glorious and important consequence!\*

The horrid practice of *Dragooning*, which was used by Papists, for converting supposed heretics, was another melancholy example of religious cruelty and frenzy. In the reign of Louis XIV. of France, his troopers, soldiers, and dragoons, entered into the houses of the Protestants, where they marred and defaced their household stuff, broke their looking-glasses, let their wine run about their cellars, threw about and trampled under foot their provisions, turned their dining-rooms into stables for their horses, and treated the owners with the highest indignity and cruelty. They bound to posts mothers that gave suck, and let their sucking infants lie languishing in their sight for several days and nights, crying, mourning, and gasping for life. Some they bound before a great fire, and after they were half roasted, let them go. Some they hung up by the hair, and some by the feet, in chimneys, and smoked them with wisps of wet hay till they were suffocated. Women and maids were hung up by their feet, or by their arm-pits, and exposed stark naked to public view. Some they cut and slashed with knives, and after stripping them naked, stuck their bodies with pins and needles from head to foot; and, with red hot pincers, took hold of them by the nose and other parts of the body, and dragged them about the rooms till they made them promise to be *Catholics*, or till the cries of these miserable wretches, calling upon God for help, induced them to let them go. If any, to escape these barbarities, endeavoured to save themselves by flight, they pursued them into the fields and woods, where they shot at them, as if they had been wild beasts; and prohibited them from departing the kingdom, upon pain of the galleys, the lash, and perpetual imprisonment. On such scenes of desolation and horror, the Popish clergy feasted their eyes, and made them only a matter of laughter and of sport.† —What a striking contrast to the benevolence of the Deity, whom they impiously pretend to serve! Could a savage American have devised more barbarous and infernal cruelties?

In the civil wars, on account of religion, which happened in France, in the beginning of the 17th century, above a million of men lost their lives, and nine cities, 400 villages, 2000 churches, 2000 monasteries, and 10,000 houses were burn-

\* See a late publication entitled “Memoirs of Henry the Great, and of the Court of France during his reign,” 2 vols. 8vo, in which is contained the fullest description of this massacre which has appeared in our language.

† For a more particular account of such scenes, see Ency. Brit. Article Dragooning.

ed or destroyed, during their continuance; besides the many thousands of men, women, and children, that were cruelly butchered: and 150,000,000 of livres were spent in carrying forward these slaughters and devastations. It is said of Louis XIII. who carried on these wars, by one of his biographers and panegyrists, Madame de Motteville that, "what gave him the greatest pleasure, was his thought of driving heretics out of the kingdom, and thereby purging the different religions which corrupt and infect the church of God."\* In the Netherlands alone, from the time that the edict of Charles V. was promulgated against the reformers, more than 100,000 persons were hanged, beheaded, buried alive, or burned on account of religion. The prisons were crowded with supposed heretics; and the gibbet, the scaffold, and the stake, filled every heart with horror. The Duke of Alva, and his bloody tribunal, spread universal consternation through these provinces; and, though the blood of eighteen thousand persons, who, in five years, had been given up to the executioner for heresy, cried for vengeance on this persecutor, and his adherents, yet they gloried in their cruelty. Philip II. in whose reign these atrocities were committed, hearing one day, that thirty persons at least had a little before been burned at an *auto da fe*, requested that a like execution might be performed in his presence; and he beheld with joy forty victims devoted to torments and to death. One of them, a man of distinction, requesting a pardon, "No," replied he, coldly, "were it my own son I would give him up to the flames, if he obstinately persisted in heresy."†

Even in our own island, the flames of religious persecution have sometimes raged with unrelenting fury. During two or three years of the short reign of Queen Mary, it was computed that 277 persons were committed to the flames, besides those who were punished by fines, confiscations, and imprisonments. Among those who suffered by fires were five bishops, twenty-one clergymen, eight lay gentlemen, and eighty-four tradesmen; one hundred husbandmen, fifty-five women, and four children. And, a century and a half has scarcely elapsed, since the Presbyterians in Scotland were hunted across moors and mosses, like partridges of the wilderness, slaughtered by bands of ruffian dragoons, and forced to seek their spiritual food in dens, and mountains, and forests, at the peril of their lives. Hunter, a young man about nineteen years of age, was one of the unhappy victims to the zeal for Papacy of Mary queen of England. Having been inadvertently betrayed by a priest, to deny the doctrine of transubstantiation, he absconded to keep out of harm's way. Bonner, that arch-hangman of Popery, threatened ruin to the father if he did not

deliver up the young man. Hunter, hearing of his father's danger, made his appearance, and was burned alive, instead of being rewarded for his filial piety. A woman of Guernsey was brought to the stake, without regard to her advanced pregnancy, and she was delivered in the midst of the flames. One of the guards snatched the infant from the fire; but the magistrate, who attended the execution, ordered it to be thrown back, being resolved, he said, that nothing should survive which sprung from a parent so obstinately heretical.\*

What a dreadful picture would it present of the malignity of persons who have professed the religion of Christ, were we to collect into one point of view, all the persecutions, tortures, burnings, massacres, and horrid cruelties, which, in Europe, and Asia, and even in the West Indies and America, have been inflicted on conscientious men for their firm adherence to what they considered as the truths of religion! When we consider, on the one hand, the purity of morals, and the purity of faith which generally distinguished the victims of persecution; and, on the other, the proud pampered priests, abandoned without shame to every species of wickedness, we can scarcely find words sufficiently strong to express the indignation and horror which arise in the mind, when it views this striking contrast, and contemplates such scenes of impiety and crime. Could a religion, which breathes peace and good will from heaven towards men, be more basely misrepresented? or can the annals of our race present a more striking display of the perversity and depravity of mankind? To represent religion as consisting in the belief of certain incomprehensible dogmas, and to attempt to convert men to Christianity, and to inspire them with benevolence, by fire, and racks, and tortures, is as absurd as it is impious and profane and represents the Divine Being as delighting in the torments and the death of sinners, rather than that they should return and live.—But, without dwelling longer on such reflections and details, I shall just present an example or two of the moral state of Roman Catholic countries, as a specimen of the effects to which their system of religion naturally leads.

"By their fruits shall ye know them," says our Saviour. Wherever religion is viewed as consisting chiefly in the observance of a number of absurd and unmeaning ceremonies, it is natural to expect that the pure morality of the Bible will seldom be exemplified in human conduct. This is strikingly the case in those countries, both in Europe and America, where the Catholic religion reigns triumphant.—Mr. Howison, whose work, entitled "*Foreign Scenes*," I formerly quoted, when speaking of the priesthood in the island of Cuba, says, "The number of priests in Havana exceeds four hundred. With a few excep-

\* Motteville's *Memoirs of Anne of Austria*, Vol. I. p. 22.

† Millot's *Modern History*, vol. II. p. 126.

\* Kalm's *Sketches*, vol. IV.

tions, they neither deserve nor enjoy the respect of the community. However no one dares openly to speak against them. In Havana, the church is nearly omnipotent, and every man feels himself under its immediate jurisdiction. Most people, therefore, attend mass regularly, make confession, uncover, when passing a religious establishment of any kind, and stand still in the streets, or stop their volantes, the moment the vesper-bell begins ringing. But they go no further; and the priests do not seem at all anxious that the practice of such individuals should correspond to their profession. The priests show, by their external appearance, that they do not practice those austerities which are generally believed to be necessary concomitants of a monastic life. The sensual and unmeaning countenances that encircle the altars of the churches, and the levity and indifference with which the most sacred parts of the service are hurried through, would shock and surprise a Protestant, were he to attend mass with the expectation of finding the monks, those solemn and awe-inspiring persons, which people, who have never visited Catholic countries, often imagine them to be.

The following extract, from a late writer, exhibits a specimen of the religion and of the moral feelings of the NEAPOLITANS. "When Vesuvius thunders aloud, or when an earthquake threatens them with destruction—when fiery streams vomited from the roaring mouth of the volcano roll on, carrying desolation over the plains below—when the air is darkened by clouds of smoke, and showers of ashes, the Neapolitans will fall on their knees, fast, do penance, and follow the processions barefooted; but as soon as the roar has ceased, the flame has disappeared, and the atmosphere has recovered its wonted serenity, they return to their usual mode of life, they sink again to their former level, and the tinkling sounds of the tumburella call them again to the lascivious dance of the tarentella."\*—As an evidence of the litigious dispositions of the Neapolitans, the same author informs us, "That there is scarcely a landholder but has two or three causes pending before the courts—that a lawyer, and a suit, are indispensable appendages of property;—and that some of the principal families have suits which have been carried on for a century, and for which a certain sum is yearly appropriated, although the business never advances; and, at last the expenses swallow up the whole capital."—"The infinite number of churches," says a late writer, "is one of the most efficient causes of the decline of the religion of Rome, whose maxims and practice are diametrically opposite to those of the Gospel. The Gospel is the friend of the people, the consoler of the poor. The religion of Rome, on the contrary, considers all nations as great flocks, made to be shorn or eaten according to the good

\* Vissieux's "Italy in the 19th century," 1824.

pleasure of the shepherds: for her the golden lever is the lever of Archimedes. The favours of the church are only showered on those who pay; with money we may purchase the right to commit perjury and murder, and be the greatest villains at so much per crime; according to the famous Tariff printed at Rome, entitled, "Taxes of the Apostolic Chancery."\*

M. Jouy, in his late publication, "The Hermit in Italy," presents the following picture of the religion and the practical morality of the Tuscans. The greediness after profit is such, among the lower classes of shop-keepers, that they adulterate their merchandise so much as to render it almost intolerable. Milk, cheese, and butter, are always in peril under the hands of a Florentine shop-keeper. It is impossible to meet with good butter, except at the dairies. The grocers are not exempt from the imputation of these illicit mixtures, and adulterations of their goods. I bought, from one of them, some brown sugar, which would not dissolve in the mouth; and, on examination, I found, that nearly one third part consisted of powdered marble, which had been mixed up with it. Yet they are excessively punctual in the outward ceremonies of religion; and whenever they remove from one place to another, a large cross, or a madonna, is always stuck up at full length in the cart."

In a conversation which Bonaparte had with his friends at St. Helena, on the subject of religion, as related by Las Casas, in his Journal, he said, among many other things, "'How is it possible that conviction can find its way to our hearts, when we hear the absurd language, and witness the acts of iniquity of the greatest number of those whose business it is to preach to us? I am surrounded with priests, who preach incessantly that their reign is not of this world, and yet they lay hands upon every thing they can get. The Pope is the head of that religion from heaven, and he thinks only of this world,' &c. The Emperor ended the conversation, by desiring my son to bring him the New Testament, and taking it from the beginning, he read as far as the conclusion of the speech of Jesus on the mountain. He expressed himself struck with the highest admiration at the purity, the sublimity, the beauty of the morality it contained, and we all experienced the same feeling."

Such facts may suffice as specimens of the benevolence and morality which exist in Roman Catholic countries.

#### MORAL STATE OF THE PROTESTANT CHURCH, AND OF THE DISPOSITIONS GENERALLY MANIFESTED AMONG CHRISTIANS IN OUR OWN COUNTRY.

This is a topic which would admit of a very extended illustration; but my present limits will

\* "Picture of Modern Rome," by M. Santo Domingo. 1824.

permit me to do little more than simply to allude to a few prominent dispositions displayed by the different sections of the Protestant church.—We have already seen some of the pernicious effects which flowed from the divisive and contentious spirit of Christians, under the reign of the Christian emperors, and during the middle ages, when ignorance and intolerance so extensively prevailed.

The present state of the Christian world affords abundant proofs that this spirit is far from being extinguished. Christians are at present distinguished by the peculiarity of their opinions respecting—the person of Christ, and the attributes of which he is possessed—the means by which salvation is to be obtained—the measure and extent of divine benevolence—the Government of the Christian church—and the ceremonies connected with the administration of the ordinances of religion. Hence the religious world appears arranged into such sects and parties as the following:—Arians, Socinians, Unitarians, Sabellians, Necesarians, and Trinitarians;—Baxterians, Antinomians, Arminians, Calvinists, Lutherans, Sub-lapsarians, Supra-lapsarians, Sandemanians, Swedenborgians, and Moravians;—Roman Catholics, Protestants, Huguenots, Episcopalians, Presbyterians, Independents, Seceders, Brownists, Pædo-Baptists, Anti-Pædo-Baptists, Keilamites, Methodists, Jumpers, Universalists, Sabbatarians, Millenarians, Destructionists, Dunkers, Shakers, Mystics, Hutchinsonians, Muggletonians, the followers of Joanna Southcott, &c. &c.—Most of these sectaries *profess their belief* in the existence of One Eternal, Almighty, Wise, Benevolent, and Righteous Being, the Creator and Preserver of all things;—in the Divine authority of the Holy Scriptures;—that God is the alone object of religious worship;—that Jesus of Nazareth is the true Messiah, and the Son of God;—“that he died for our offences, and was raised again for our justification;”—that there is a future state of rewards and punishments;—that there will be a resurrection from the dead;—that it is our duty to love God with all our hearts, and our neighbour as ourselves;—that the Divine law is obligatory on the consciences of all men;—that virtue and piety will be rewarded, and vice and immorality punished, in the world to come.

Yet, though agreeing in these important articles of the Christian system, how many boisterous and malignant disputes have taken place between Calvinists and Arminians, Episcopalians, Presbyterians, Independents, and Methodists, respecting the speculative points in which they disagree! While controversies among philosophers have frequently been conducted with a certain degree of candour and politeness, the temper with which religious disputants have encountered the opinions of each other, has gene-

rally been opposed to the spirit of Christian love, to the meekness and gentleness of Christ, and even to common civility and decorum. The haughty and magisterial tone which theological controversialists frequently assume,—the indignant sneers, the bitter sarcasms, the malignant insinuations, the personal reproaches, they throw out against their opponents,—the harsh and unfair conclusions they charge upon them,—the general asperity of their language,—and the bold and unhallowed spirit with which they apply the denunciations of Scripture to those whom they consider as erroneous, are not only inconsistent with every thing that is amiable and Christian, but tend to rivet more powerfully in the minds of their opponents, those very opinions which it was their object to subvert. To gain a victory over his adversary, to hold up his sentiments to ridicule, to wound his feelings, and to bespatter the religious body with which he is connected, is more frequently the object of the disputant, than the promotion of truth, and the manifestation of that “character which is the bond of perfection.” And what are some of the important doctrines which frequently rouse such furious zeal? Perhaps nothing more than a metaphysical dogma respecting the sonship of Christ, absolute or conditional election, the mode of baptism, the manner of sitting at a communion-table, an unmeaning ceremony, or a circumstantial punctilio in relation to the government of the church! While the peculiar notions of each party, on such topics, are supported with all the fierceness of unhallowed zeal, the grand *moral* objects which Christianity was intended to accomplish are overlooked, and the law of meekness, humility, and love, is trampled under foot.

The following are some of the ideas entertained respecting the *rights* of religious disputants, as assumed by the disputants themselves:—“The Controversialist,” says Mr. Vaughan, in his “Defence of Calvinism,” “is a wrestler; and is at full liberty to do all he can, in the fair and honest exercise of his art, to supplant his antagonist. He must not only be dexterous to put in his blow forcibly; but must have a readiness *to menace with scorn*, and *to tease with derision*, if haply he may, by these means, unnerve or unman his competitor. I know not that he is under any obligation to withhold a particle of his skill and strength, whether offensive, or defensive, in this truly Spartan conflict.” In perfect accordance with these maxims, he thus addresses his adversary: “Why, Sir, I will *fight* you upon this theme, as the Greeks did for the recovery of their dead Patroclus; as Michael the archangel, when, contending with the Devil, he disputed about the body of Moses; as the famed Athenian, who *grasped his ship with his teeth*, when he had no longer a hand to hold it by. It shall be with a loss not less than life, that I resign this splendid attestation (Rom. viii. 28-

30.) to the triumphal origin, procession, and coronation, of grace in the redeemed."

Wo to religion, when it meets with such boisterous "wrestlers!" Its true glory will be obscured, its beauty defaced, its interests betrayed, and its benevolent spirit smothered, amidst the smoke and dust raised by the onsets of such angry combatants. Do such controversialists really imagine, that "the wrath of man worketh the righteousness of God?" or, that the religion of Heaven stands in need of such warlike arts, and unhallowed passions, for its vindication and defence? If it did, it would be a religion unworthy of our reception and support. What a contrast to the mild and gentle spirit of Christianity, to behold one zealot dipping his pen in wormwood and gall, when he sits down to defend the Religion of Love! and another, standing up in a Synod or Assembly, with eyes sparkling with indignation, a mouth foaming with rage, and a torrent of anathemas and abusive epithets bursting from his lips, against the supposed abettors of an erroneous opinion! while at the same time, they imagine that they are fired with holy zeal for the honour of the Lord God of Sabaoth. Such disputants seem not to be aware, that they are grossly misrepresenting the genius of the Christian system, and bidding defiance to its most distinguishing principles and laws.—There are heresies in *conduct*, as well as heresies in doctrine; and of all heresies, the former are the most pestilential and pernicious. And why do not Controversialists and Religious Societies manifest as much zeal against heresies in temper and morality, which are nursed among the members of every church, as they do against heresies in theology? If these heresies were more particularly investigated and subverted, and a greater latitude allowed for the exercise of private judgment, the church of Christ would present a very different moral aspect from what she has hitherto done.

Again, there is nothing which so strikingly marks the character of the Christian world in general, as the want of candour, the spirit of jealousy, and the evil surmisings which the different denominations of religionists manifest towards each other. There is a prevailing disposition in one religious party to speak evil of another; and it appears, in many instances, to afford a high degree of satisfaction, when one party can lay hold of the inadvertencies of another denomination, or even of the imprudence of a single individual, in order to asperse the character of the whole body, and to hold it up to general derision and contempt. Episcopalians look down with feelings of scorn and contempt on Methodists and Dissenters; Independents sneer at Methodists, and Methodists at Independents; Presbyterians are disposed to revile Independents, as self-conceited, sanctimonious pretenders, and Independents, to treat with unbecoming

levity, and even with ridicule, the opinions and practices of Presbyterians; while the different classes of Baptists, distinguishable only by the slightest shades of opinion, stand aloof from each other, in a warlike attitude, and refuse to join with cordiality in the ordinances of Divine worship. I have seldom been in company with individuals of any particular party, in which I have not found, when allusions were made to another denomination, insinuations thrown out to their prejudice; and that the detail of any error or imperfection which attached to them, was generally relished, and even received with a high degree of satisfaction. Hence it happens, that the rules of common civility are every day violated by the different sectaries. If a person belonging to a particular denomination be accidentally introduced into a company composed of persons belonging to another religious party, he is frequently treated with reserve, and with a spirit of jealousy and suspicion, even although he may be viewed, on the whole, as a Christian at bottom. I have known individuals of respectable character and attainments, who, from conscientious motives, had forsaken the denomination to which they formerly belonged, have, merely on this account, been treated with scorn and neglect, been banished from the intimacies of social and friendly intercourse, and been regarded nearly in the same light as a Turk or an infidel; and that, too, by men who pretended to liberality, and to literary accomplishments.

There is certainly neither heresy nor orthodoxy inherent in stone or lime, in a church-pew, or a pulpit cushion:—yet one denomination will rudely refuse to another, the liberty of preaching in their place of worship, when it can conveniently be spared, although nothing but the fundamental doctrines acknowledged by both are intended to be proclaimed; just as if the walls, the pews, and the pulpit of a church, would receive a stain of pollution from the presence of another sectary. Even in those cases where the common interests of Christianity are to be supported,—as in vindicating the cause of Missionary, and other Philanthropic institutions,—if the preacher belongs to a dissenting body, he is shut out from the spacious churches of the Establishment, where he might address a numerous audience, and obtain a large collection; and is obliged to confine his exertions within the narrow walls of any public hall, or meeting-house, that he can procure. We account it no more than a piece of common civility, to accommodate a neighbour with a barn, a parlour, or even a dining-room, for the entertainment of his friends at a wedding or a funeral; but such is the little progress that professed Christians have made in the exercise of a noble and generous liberality, that, when we ask the use of a church, or meeting-house, only for a couple of hours, we are spurned away with rudeness and indignation.—The Christian world

is unhappily divided into sects and parties; and these divisions must still continue for a time; but what should hinder Christian ministers of different parties from, occasionally at least, officiating for each other, in order to show to the world, that they entertain no malignant jealousies, and that they are united in the bonds of a common Religion? Yet, do we ever behold an Episcopalian officiating for a Methodist, an Independent preaching in an Established church, or a Baptist leading the devotional exercises of a society of Presbyterians? If such a case occasionally occur, it is so far from being a matter of course, that it is considered a phenomenon in the religious world. Yet all these different parties recognise the leading doctrines and duties exhibited in the Christian Revelation; and the points in which they differ are "trifles light as air," when compared with those important truths in which they all agree.\*

Even among Christians belonging to the same religious society how often do we behold a display of "bitter envyings," contentious dispositions, and malignant passions! Perhaps a mere punctilio respecting a certain mode of worship, or a difference in opinion about the choice of a pastor, will throw the whole society into a flame. Evil passions will be engendered; backbitings, whisperings, tumults, and dissensions, will arise; harsh and unfounded conclusions, respecting the motives and characters of individuals, will be drawn; alienations of affection will be induced; friendly intercourse interrupted; an attitude of hostility assumed; and even the rules of common civility violated;—so that a calm and impartial spectator will plainly discern, that the spirit of Christianity has never been thoroughly imbibed, and that they have never learned the apostolic precept, "to forbear one another in love," however high pretensions they may have previously made to spirituality of affection and deportment. Among Christians of every name, we find dispositions and practices daily prevailing, which

are altogether inconsistent with the genius of the religion of Christ, and directly repugnant to its precepts. Slander, dishonesty, falsehood, cheating, swindling, and vexatious litigations, are far from being uncommon among those who profess to be united in the bonds of a common Christianity. How little dependence can we have, in social and commercial transactions, on the promise or the declaration of a man, merely on the ground of his being a Christian in profession! If written engagements, and civil laws, did not secure our property, and the performance of promises and contracts, our reliance on Christian principle, abstractly considered, in the present state of the religious world, would prove like that of a person who leans upon a broken reed. How few would fulfil their promises and engagements, when they interfered with their ambitious schemes, and their pecuniary interests! How many instances of fraudulent bankruptcy happen among the professors of religion! And in cases of common bankruptcy, where a legal settlement has been obtained, is there one out of a hundred that ever thinks of performing an act of natural justice, in restoring to his creditors the loss they had sustained, when he afterwards has it in his power?

Finally, the degree in which the spirit of intolerance and persecution still prevails, shows a lamentable deficiency of benevolence and of Christian spirit in the religious world. Notwithstanding the unjust and cruel sufferings which English Protestants endured from Popish priests and rulers, a short period only elapsed, after they had risen to power, before they began in their turn, to harass their Dissenting brethren, with vexations and cruel prosecutions, and fines and imprisonments, till they were forced to seek for shelter in a distant land. And no sooner had the English Independents settled in America, than they set on foot a persecution against the Quakers, no less furious than that which they themselves had suffered in the country from which they had fled. A number of these worthy persons they threw into prison, and seized upon the books they had brought from England, and committed them to the flames. In virtue of a law which had been made against heretics in general, sentence of banishment was passed upon them all; and another law punished with death, "all Quakers who should return into the jurisdiction after banishment;" and it is a fact, that four persons actually suffered death, under this impolitic and unjust law.\* Nor did the Reformed clergy in Scotland lose sight of that

\* The following recent facts will illustrate some of the positions contained in this paragraph.—It appears that the minister of the parish of Annan has been in the habit of allowing Dissenters occasionally to preach in the parish church. His Assistant brought this heavy offence before a late meeting of the Presbytery; and, by that body, it was declared, that no Dissenter should, in future, pollute the said pulpit. They, at the same time, voted thanks to the Assistant, for his manly and liberal conduct in making the complaint.—*Public Prints, April, 1824.*

"Lately, the minister of a parish, a few miles to the westward of Cupar, hearing that, at the request of some of his parishioners, a sermon was to be preached to them, by a Dissenting clergyman from Cupar, and knowing that the school-room was the only place where that could be conveniently done, he called upon the teacher and commanded him not to allow the school-room to be used for such a purpose. In a few days, a company of strolling players visited the parish; whereupon the worthy pastor, calling on the schoolmaster, ordered the school-room to be at their service, to perform in"—*Dundee Courier April 1825.*

\* Morse's American Geography.—The following severe laws, among others, were enacted against the Quakers. "Any Quaker, after the first conviction, if a man, was to lose one ear,—and for the second offence, the other:—a woman, to be each time severely whipped;—and the third time, whether man or woman, to have their tongues bored through with a red hot iron.

magisterial authority which had been assumed by the Romish church. Upon a representation, in 1646, from the commission of the Kirk of Scotland, James Bell, and Colin Champbell, bailies of Glasgow, were committed to prison by the Parliament, merely for having said, that "Kirkmen meddled too much in civil matters."\* Even so late as the middle of the eighteenth century, when Whitefield, Wesley, and other pious men, began to address the ignorant villagers of England on the most important subjects, "a multitude has rushed together, shouting and howling, raving, and cursing, and accompanying their ferocious cries and yells with loathsome or dangerous missiles, dragging or driving the preacher from his humble stand, forcing him, and the few who wished to hear him, to flee for their lives, sometimes not without serious injury before they could escape. And these savage tumults have, in many cases, been well understood to be instigated by persons, whose advantage of superior condition in life, or even express vocation to instruct the people better, has been infamously lent in defence of the perpetrators, against shame or remorse, or legal punishment for the outrage. And there would be no hazard in affirming, that, since Wesley and Whitefield began to conflict with the heathenism of the country, there have been in it hundreds of instances answering in substance to this description.—Yet the good and zealous men who were thus set upon by a furious rabble of many hundreds, the foremost of whom active in direct violence, and the rest venting their ferocious delight, in a hideous blending of ribaldry and execration, of joking and cursing,—were taxed with a canting hypocrisy, or a fanatical madness, for speaking of the prevailing ignorance, in terms equivalent to those of the prophet, 'The people are destroyed for lack of knowledge.'"+

But we need not go back even to the distance of half a century in order to find instances of religious intolerance among Protestant communities and churches; our own times unhappily furnish too many examples of a bigoted, intolerant, and persecuting spirit. Little more than two years have elapsed since the Methodist chapel in Barbadoes was thrown down and demolished by the *mob-gentry*, and with the connivance of the public authorities of that slave trafficking island, and Mr. Shrewsbury, a worthy and respected pastor and missionary, obliged to flee for his life. Previous to this outrage, he suffered every species of insult, contumely, and reproach. He was abused as a villain, and hissed at in the streets, not by mere rabble, but by the *great vulgar*; by merchants from their stores, and individuals in the garb of gentlemen. By such characters his chapel was surrounded, and partly filled, on Sunday the 5th October, 1823.

\* Kalm's Sketches.

+ Foster's "Essay on Popular Ignorance."

Thin glass bottles had been previously prepared and filled with a mixture of oil and assafetida, and all of a sudden, they were thrown with great violence in the midst of the people, and one was aimed at the head of the preacher; and during the whole service, stones were rattling against the chapel from every quarter. On the next Sabbath an immense concourse of people assembled, "breathing out threatenings and slaughter;" and from 20 to 30 of the *gentlemen-mob* planted themselves around the pulpit apparently ready for any mischief. Men wearing masks, and having swords and pistols, came galloping down the street and presenting their pistols, fired them at the door; and it was originally designed to have fire crackers among the females, to set their clothes on fire. At length, on Sabbath, the 19th, this execrable mob, consisting of nearly 200 *gentlemen*, and others, again assembled, with hammers, saws, hatchets, crows, and every other necessary implement; and in the course of a few hours, the lamps, benches, pews, pulpit, and even the walls, were completely demolished. They entered the dwelling-house broke the windows and doors, threw out the crockery ware, chopped up tables, chairs, and every article of furniture; tore the manuscripts of the preacher, and destroyed a library of more than 300 volumes. All this was done under the light of the full moon, in the presence of an immense crowd of spectators, without the least attempt being made to check them either by the civil or military authorities—while the unfortunate preacher, with his wife in an advanced state of pregnancy, had to flee to a neighbouring island to save his life! Such is the tolerant and humane conduct of *gentlemen* Protestants of the nineteenth century! gentlemen who would, no doubt, consider it very unhandsome were they to be compared to Goths and Vandals, or to the rude and barbarous savages of Papua or New Holland.\*

About the same period, the authorities of Demerara set on foot a persecution against Mr. Smith, Missionary from the London Society, under various pretexts: but his real crime in the eyes of his persecutors, was, his unwearied zeal in instructing the negroes in the knowledge of religion. He was condemned to death by a court-martial, in the face of every principle of justice: he died in prison, was refused the privilege of a Christian burial, and his friends were prohibited from erecting a stone to mark the spot where his body was laid. The whole details of this transaction present a scene of savage barbarity, created by the lust of gain, scarcely to be paralleled in the history of Europe.

In Switzerland, which was formerly the head

\* For a more particular detail of these execrable transactions, see "Report of the Wesleyan Missionary Society for 1824:" and the debates in Parliament in 1825.

quarters of Protestantism, the demon of religious persecution has again reared its head. The council of state of the Pays de Vaud, at the instigation of the clergy, on January 15, 1825, published a decree, "prohibiting, under the penalty of severe fines and imprisonments, all meetings for religious worship or instruction, other than those of the Established Church:" and in the following May, another decree was issued, which denounces "fines, imprisonment, or banishment, upon the most private kind of religious assembly, or even the admission of a single visitor to family worship." In pursuance of these disgraceful laws, several ministers and private Christians of high character for piety and acquirements, have been banished from the Canton, some for one and some for two years—cut off from all means of subsistence, unless possessed of independent fortunes, and left perhaps to starve and perish in foreign lands. If they returned before the expiration of their sentence, it is said that *death* is the punishment to be inflicted. One poor man, a school-master, in the principality of Neuchâtel, has been condemned to ten years' banishment. He was brought out from prison, tied with cords, and compelled to kneel in the snow in the public square to hear his sentence read. His crime was, gathering together a few fellow Christians in his own house, and there having the Lord's supper administered by a regularly ordained minister!\*

And is England pure from the spirit of persecution and intolerance? Let us see.—At Kenneridge in Dorsetshire a worthy and excellent individual, belonging to the Wesleyan denomination, had attended on a green, where 20 or 30 persons usually congregated, on a Sunday afternoon, to listen to the truths he thought it important to declare. The clergyman of the parish approached with a retinue of servants, and *commanded* him to desist. The preacher took no notice of the command and proceeded to read his text. The clergyman then commanded the tithing-man to seize him. He was directed to be conveyed to Wareham jail; and to every question the preacher put, as to the ground of his being seized upon, the *reverend* and *worthy* clergyman only replied by the brandishing of his stick.—Instances have occurred in which clergymen of the establishment have refused to *bury the dead*. At Chidds Ercal, in Shropshire, the child of a poor man was refused interment, and the father was obliged to carry it six miles, before it could be laid at rest in its mother earth.—At Catsfield, in Sussex, a similar act of infamy was committed.—At the moment when the bell had tolled, when the earth was to fall heavily upon the coffin, containing the only remains of the being that affection had endeared, and when

those who stood by needed all the consolations that religion can supply—at this moment the clergyman appeared, but advanced only to give pain to the mourners, and to agonize a parent's heart, by saying, "Now that you have waited an hour till it suited me to come, I will not inter your child! I did not know that you were Dissenters—take your child some where else—take it where you please—but here it shall not lie in consecrated ground." And, in fact, they were compelled to carry the child away eleven miles from the abode of its parents, and from the place that gave it birth, before it could find repose in its kindred dust.—At Mevagissey, in the county of Cornwall, the vicar refused to allow the corpse of a Dissenter to be brought within the church, and, therefore, read the burial service in the open air; but, in consequence of which, he read only a part of that service, and omitted the most beautiful portion.—Such a power appears to be conceded to the clergy by the laws of the church; but the spirit which gave it existence is deeply to be deplored, as the spirit of bigotry and intolerance. At Wellingborough, a clergyman, in opposition to a custom which had been established for sixty years, issued orders, that no bell should toll when a Dissenter expired. He boldly avowed, "that he never would permit the passing bell to be rung for a Dissenter, even in the event of an interment in the church-yard; that whilst he held the curacy, no bell of his church should ever toll for a Dissenter; and that he would not even permit the bells to ring for a marriage where the parties were Dissenters." In reference to this case, an appeal was made to the Bishop of Peterborough, who wrote a long letter on the subject, and defended the conduct of this Wellingborough curate.—At Newport Pagnel, two persons of decent appearance, teachers of Baptist Societies, were collecting subscriptions for the erection of a new place of worship.—After arriving at the residence of the parish clergyman, they were taken before a clerical magistrate, who upon the oath of the other clergyman, that they were rogues and vagrants, committed them to Aylesbury jail; where they were confined for three weeks in common with the basest felons; among convicted thieves of the most abandoned character;—nay, more, they were sentenced to the tread-mill, and kept at hard labour there, though, during the whole time, one of them was afflicted with spitting of blood. Their papers were seized upon; their money was taken from them; and by means of it the expense of sending them to prison was defrayed.\*

All the above-stated instances, and many others of a similar description, occurred within the limits of the year 1824; and every year since

\* See a pamphlet on this subject by Dr. Pye Smith. See also Cong. Mag. for June, 1825, and other periodical works of that date.

\* The reader will find a more particular detail of these cases, in the "Address of John Wilks, Esq. at the Fourteenth Anniversary of the Protestant Society for the Protection of religious Liberty, in May, 1825.

the "Society for the Protection of Religious Liberty" was formed, similar instances, some of them of a more barbarous nature, have been brought forth to public view. And, were it not for the protection which this Society affords to the victims of intolerance, it is highly probable, that vexatious persecutions, insults, fines, and imprisonments, on account of differences in religious opinions, would be much more common than they now are. Were such individuals as those to whom we have now alluded, permitted, by the laws of our country, to carry their intolerant spirit to its utmost extent, Dissenters would have no security either for their property or their lives; and the fires of Smithfield would again be kindled, to torture the souls, and to consume the bodies, of all who refused to conform to the dogmas of a national church.

After what has been stated in the preceding part of this work, it is almost needless to say, that such an intolerant and persecuting spirit is diametrically opposite to every principle that pervades the Christian system; and there cannot be a grosser misrepresentation of its spirit and tendency, than to ascribe such dispositions and conduct to the genius of that religion which **INTOLERANCE** has thought proper to assume. Can a single instance be produced of a persecuting spirit in the conduct of Jesus Christ, or in that of any one of his apostles! When he "was reviled, he reviled not again; and when he suffered, he threatened not; and he solemnly rebuked his followers when the least symptom of intolerance or revenge was displayed. Can a religion, which commands us to love our neighbours as ourselves—to be kindly affectionate one towards another—to love our enemies—to do good to them that hate us—to bless them that curse us—and to pray for them that despitefully use us,"—can such a religion be supposed to give the least countenance to actions that are both intolerant and inhumane? If the religion of Christ have any one prominent object which distinguishes it from all others, it is this—to unite mankind in one harmonious and affectionate society; and such an object is altogether incompatible with resentment, intolerance, or persecution in any shape. "By this shall all men know," says Jesus, "that you are my disciples, if ye love one another."

Here I must close the illustration of the moral state of mankind, though they might have been carried to a much greater extent. They present to every benevolent mind a *gloomy* picture of the moral aspect of the human race, and of the depravity which the principle of malevolence carries in its train. It is a picture which shows us that those moral principles and laws which the Creator intended to promote, the felicity of all worlds, have never yet been brought into full ef-

fect in the world in which we live. It is a picture, however, from which we ought not to turn away our eyes. It sets before us the evils which require to be counteracted, and the obstacles which must be surmounted, before the principles of malignity be extirpated, and the moral principles of the Christian system take root in the world. But such views of the existing state of the moral world, so far from operating as sedatives, ought to stimulate us to exert every energy, and to use every judicious and powerful mean, which has a tendency to promote the accomplishment of this important object.

It would have given me pleasure to have presented before the eye of the reader a more cheerful and alluring picture; but "facts are stubborn things," and there is no resisting the force of the evidence which they adduce,—I intend to relieve some of the dark shades of this picture, by exhibiting some faint radiations of truth and benevolence which are still visible amidst the surrounding gloom. For, amidst the moral darkness which has so long covered the earth, some streaks of celestial light have always been visible; and the dawning of a brighter day now begins to gild our horizon. Substantial knowledge is now beginning to diffuse its benign influence on all ranks; the shackles of despotism are bursting asunder; the darkness of superstition is gradually dispelling; the spirit of persecution is borne down and powerfully opposed by the force of truth and of common sense, and the rights of conscience are beginning to be generally recognised. Philanthropic institutions of various descriptions have been established, education is extending its beneficial effects; the instruction of the young is becoming an object of more general attention; philosophical institutions, village libraries, and associations for intellectual improvement, are rapidly organizing; Bible and missionary societies are extending their influence through every portion of the religious world, and Christianity is now beginning to display its beneficent energies on distant continents, and the islands of the ocean.—But, instead of entering into details in the illustration of these and similar effects which have always, in a greater or less degree, accompanied the progress of the Christian religion, I shall, in the mean time, refer the reader to the excellent work of Dr. Ryan, "On the History of the effects of Religion on Mankind."

Here a question may be proposed by some of my readers,—Is it possible to bring the inhabitants of this world, in their present depraved state, to a general observance of the laws of benevolence which have been illustrated in the preceding part of this work? To such a question I would reply,—*Whatever man has done, man may do.* Amidst the depravity and the darkness with which the earth has been generally enveloped, individuals have occasionally arisen

who have shone as lights in the moral world, and exhibited bright patterns of Christian temper and of active benevolence. The Apostle Paul had his mind imbued with a large portion of the spirit of love. He voluntarily embarked in a tour of benevolence through the nations; and in spite of reproaches, persecutions, stripes and imprisonments; in the midst of "perils in the waters, perils of robbers, perils by his own countrymen, perils in the city, and perils in the wilderness;" and in the face of every danger, and of death itself, he prosecuted, with a noble heroism, his labour of love, purely for the sake of promoting the best interests of mankind. All the Apostles engaged in the same benevolent undertaking; they sacrificed every private interest, every selfish consideration; "neither counted they their lives dear unto themselves, so that they might finish their course with joy," and be the means of accomplishing the salvation of their fellow-men.

Even in our own times, many distinguished individuals have arisen, who have reflected honour on our species. The name of *Howard* is familiar to every one who is in the least acquainted with the annals of philanthropy, (see p. 20.) This excellent man, and truly philanthropic character, devoted his time, his strength, his genius, his literary acquisitions, and his fortune, and finally sacrificed his life, in the pursuits of humanity, and in the unwearied prosecution of active benevolence. He travelled over every country in Europe and in the adjacent regions of Asia, impelled by the spirit of Christian love, in order to survey the mansions of sorrow and of pain, and to devise schemes for the relief of human wretchedness wherever it existed; and, in the execution of this scheme of benevolence, the energies of his mind were so completely absorbed, that "he never suffered himself, for a moment, to be diverted from carrying it into effect, even by the most attractive of those objects which formerly possessed all their most powerful influence upon his curiosity and his taste."\*

The late *Walter Venning, Esq.*, who has been denominated, by *Prince Galitzin*, the second *Howard*, walked in the steps of his illustrious predecessor, and with the most fervent Christian zeal, devoted his short, but useful life, to the alleviation of human misery, and to the promotion of the best interests of thousands of wretched individuals who "were ready to perish." He withdrew himself from the ordinary round of genteel society, and declined all commercial business, that he might devote the whole energies of his soul to benevolent occupations. He commenced his philanthropic career, by co-operating in the formation of the "Society for improvement of Prison discipline," which was formed in London in 1816; and afterwards visited the

prisons in Petersburg, Novogorod, Tver, Moscow, and other cities in the Russian empire. The prisons, hospitals, work-houses, mad houses, houses of correction, and the abodes of misery of every description in Petersburg, were visited by him, day after day: "and many a prisoner, bowed down with affliction and iron, was cheered, instructed, and saved by his ministrations;" for his philanthropy extended both to the bodies and to the souls of men."\*

Many other examples might be produced from the annals of our times, and of illustrious characters, presently existing, to demonstrate, that a noble and disinterested benevolence is a principle, capable of being exercised even in the present degenerated state of the inhabitants of our world. We find parents some times displaying a high degree of benevolent feeling towards their offspring, and sacrificing their ease, and their personal interests, in order to secure their health, their happiness, and enjoyments. We find bosom friends like *David* and *Jonathan*, and like *Damon* and *Pythias*, rejoicing in the welfare of each other, and encountering difficulties and dangers in promoting the interests of the objects of their friendship. What, then, should hinder such dispositions from becoming universal? What should hinder them from being transferred to all the sensitive and intellectual beings, with whom we may have occasion to correspond, or to associate? Would not the universal exercise of such dispositions be highly desirable? would it not tend to banish war and discord from the world, and promote peace on the earth, and good will among men? Why, then, are such dispositions so seldom displayed? Not because the universal exercise of them is a thing impossible; but because men, actuated by selfishness, are unwilling to give full scope to the benevolent affections; because they have never yet employed all the requisite means for bringing them into full operation. If all the energies of the intellect, and all the treasures which have been expended in fostering malignant passions, and in promoting contentions and warfare, had been devoted to the great object of cultivating the principle of benevolence, and distributing happiness among men; the moral and physical aspect of our world would long ago have assumed a very different appearance from what it now wears.

The philanthropic individuals, to whom I have alluded, were men, whose actions were sometimes blended with the failings and imperfections incident to degenerated humanity; but the principle of benevolence ruled supreme over all the subordinate affections; and if the world were peopled with such men, notwithstanding the imperfections which attached to them, society, in every land, would present the appearance of a moral paradise, and form an image of the har-

\* For a particular account of the labours of this eminent philanthropist, see *Brown's "Memoirs of the public and private life of John Howard."*

\* *Mr. Venning* died in Petersburg, in 1821, in the fortieth year of his age.

many and felicity of "the saints in light." Every one who believes in the existence of a future state, fondly imagines that he shall enjoy happiness in that state. But, whence is his happiness to arise in the future world, but from the exercise of those dispositions which the law of God requires? And if the exercise of benevolent dispositions be essentially requisite for securing supreme felicity in the eternal state, their cultivation, even in the present world, must be an indispensable duty, in order to our preparation for the employments of the celestial world. For it is a law of the Creator, which is eternal and immutable, that "without holiness, no man can see the Lord." And whenever the requisite means are employed for the cultivation of holy and beneficent dispositions, we may rest assured, that our labour will be crowned with success. For the energy of the divine Spirit, from whom proceedeth every good and perfect gift, is promised to accompany the use of every proper mean, so as to render it effectual for counteracting the effects of moral evil, and for promoting the renovation of the world.

We have examples before us, not only of a few insulated individuals, but of societies, where the principle of benevolence, in a greater or less degree, pervades the whole mass. The people who have been denominated *Quakers*, have always been distinguished by their humane and peaceable dispositions, their probity and hospitality to each other, the cheerfulness of their manners, their opposition to war, and the active zeal which they have displayed in contributing to the good of mankind. The *Moravians* are also distinguished for their affectionate intercourse with each other, the liberality of their dispositions, the peaceableness of their temper, the purity and simplicity of their lives, and their missionary efforts for evangelizing the heathen world.\* Would to God that the whole

\* The following anecdote, is illustrative of the character of many of the *Moravians*, or *Hernhutters* as they are sometimes called.—In a late war in Germany, a captain of cavalry was ordered out on a foraging party. He put himself at the head of his troop, and marched to the quarter assigned him. It was a solitary valley, in which hardly any thing but woods was to be seen. In the midst stood a little cottage; on perceiving it he rode up, and knocked at the door; out comes an ancient *Hernhutter* with a beard silvered by age. "Father," says the officer, "show me a field where I can set my troopers a foraging." "Presently," replied the *Hernhutter*. The good old man walked before, and conducted them out of the valley. After a quarter of an hour's march, they found a field of barley. "There is the very thing we want," says the captain.—"Have patience for a very few minutes," replied the guide, "and you shall be satisfied." They went on, and about the distance of a quarter of a league farther, they arrived at another field of barley. The troop immediately dismounted, cut down the grain, trussed it up, and remounted. The officer upon this, says to his conductor, "Father, you have given yourself and us unnecessary trouble; the first field was much better than this." "Very true, Sir," replied the good old man. "But it was not mine."—Here we have a

world were *Quakers* and *Moravians*, notwithstanding their peculiarities of opinion! With all their foibles and imperfections, society would then wear a more beautiful and alluring aspect than it has ever yet done; peace and industry would be promoted: the fires of persecution would be quenched; philanthropy would go forth among the nations, distributing a thousand blessings, and the people would learn war, no more.

I intend in this place, to inquire into the MEANS BY WHICH THE PRACTICE OF CHRISTIAN MORALITY MIGHT BE PROMOTED. But I find that this is a subject which would require a distinct volume for its illustration. At present, I can suggest only two or three hints.

In the first place, The intellectual instruction of the young, should be an object of universal attention, both in public and private. For true knowledge is the spring of all religious emotions, and of all virtuous actions. By intellectual instruction, I do not mean merely a series of exercises in spelling, pronouncing, parsing, construing, writing, and figuring; but a communication of the elements of thought, and of clear and extensive conceptions of the physical and moral relations of the universe.—2. The moral instruction of the young should be an object of particular and incessant attention. Moral instruction should be inculcated, not merely by a reiteration of dry precepts, maxims, and abstract doctrines, or by a reference to the details and flimsy sentiments contained in fictitious narratives; but by a pointed and pacific reference to real facts; as exhibited in the Sacred History, the annals of nations, and in the scenes of the family, and of general society. I would expect no greater assistance in the work of moral instruction from the religious novels with which the Christian world is now deluged, than I would do from a circulation of the Pious Frauds which were so common in the first ages of the church. In schools, and in families, every thing which has a tendency, either directly or indirectly to foster pride, envy, contention, revenge, and other malignant affections, should be firmly and sedulously discouraged and counteracted; and higher rewards (if rewards be expedient) should in every instance, be bestowed on the individual who cultivates and displays benevolent affections,

beautiful practical exhibition of love to our neighbour, and of calm resignation to the providential dispensations of God. How few professed Christians have been found acting in this manner! And yet I doubt not, that this good man would experience more true satisfaction in the temper and conduct he displayed, than if he had offered resistance, practised dissimulation, or set them to plunder his neighbour's field. A number of disinterested actions such as this, would contribute more powerfully to the support of the Christian cause than a thousand theological disputes, imbued with the spirit and temper with which they have been most frequently conducted.

than on him who is distinguished merely for intellectual acquirements. Hitherto, a more decided preference seems to have been given to what is termed *genius* than to moral accomplishments.—3. Institutions should be formed for communicating literary and scientific knowledge, blended with moral and religious instructions, to persons of both sexes, and of every rank and age, from fifteen years and upwards, particularly to apprentices, journeymen, clerks, shop-keepers, and others, for the purpose of calling forth into action the energies of their minds, and for preventing the growth of habits of dissipation. In such institutions, the manifestation of benevolent affections, and propriety of moral conduct, should be made the conditions of enjoying the instructions and privileges of the association.—4. In connexion with these and other means, the cause of practical morality would be powerfully promoted, were the ministers of religion, among all parties, to direct their energies to the discussion of moral subjects, on Christian principles, instead of confining their attention almost exclusively to doctrinal discussions. Religion is not a system merely of speculative and metaphysical truths, nor does it consist in the contemplation of mysterious facts, or incomprehensible dogmas; but it is a rational and tangible subject, addressed to the reason, the hopes, and fears, and the common sense of mankind; and therefore, its illustrations should be chiefly derived from the facts of Sacred History, the system of nature, and from the existing objects, scenes, and associations with which we are connected.—A much greater degree of animation, and of energy, than is now displayed in instructions from the pulpit, is also requisite for arresting the attention, and riveting impressions of moral and religious truths upon the mind. If fewer sermons were delivered, and a greater portion of intellectual energy concentrated in each discourse, and if preachers, particularly among Dissenters, had fewer discourses to compose, and more time for taking an ample intellectual range through the system of nature, of Providence, and of revelation, a more powerful effect would undoubtedly be produced on the Christian world, and upon all who occasionally attend on the ministrations of religion.

I need scarcely add, that all such means ought to be accompanied with fervent prayer to the "Father of lights," and dependence on the promised aid of the Spirit of holiness. But without the application of all the energetic means which reason and revelation suggest, we have no reason to conclude, and it would be presumption to expect, that the influences of heaven will descend upon the moral world. For it appears, in point of fact, to be one part of the plan of the divine procedure, that human agents shall be the means of enlightening each other, and of promoting the renovation of the world, as "workers together with God."

#### CONCLUSIONS FROM THE GENERAL PRINCIPLES ILLUSTRATED IN THIS VOLUME.

If the general train of sentiment which runs through the preceding discussions and illustrations be admitted, the following conclusions may be deduced respecting,

I. The subject of preaching, and the grand aim which the ministers of religion, in their discourses, ought always to have in view.\* We have already seen, that it is the great object of revelation to bring into practical operation the principles of love to God and to man: and, it is obvious, that, what is the main object of Christianity to accomplish, ought to be the ultimate aim of every Christian preacher. It is not merely to convert men to the belief of certain *opinions*, or to induce them to embrace the peculiarities of a party. It is, that they may "be renewed in the spirit of their minds," and, "made meet for the inheritance of the saints in light"—it is, that they may "deny ungodliness and worldly lusts, and live soberly, righteously, and godly, in the present evil world;" and be "united together in love, which is the bond of perfection."—Metaphysical disquisitions, respecting dogmas in religion, have very little tendency to meliorate the heart, and to promote benevolent dispositions and affections. On the contrary, they have frequently produced a temper of mind directly opposite to the spirit of Christianity. They have led multitudes to pique themselves on the supposed purity of their profession, and the orthodoxy of their creed, and to point at others as heretics, and subverters of the gospel, on account of some slight differences in sentiment about a particular doctrine; while they themselves have never attempted to cultivate heavenly dispositions, and to display that charity which "suffereth long, and is kind, which is not easily provoked, and thinketh no evil." There are certain doctrines and facts, which we ought always to recognise, and to keep in view as fundamental axioms in the Christian system;—such as, that "there is one God, and one Mediator between God and man, the man Christ Jesus;" that "he died for our offences, and rose again for our justification;" that "all have sinned and come short of the glory of God;" and that "we are justified freely by his grace, through the redemption that is in Christ Jesus." But, there is no necessity for expatiating almost exclusively on these and similar doctrines, as is frequently done, to the exclusion of practical morality; since they ought to be regarded in the light rather of first principles in religion, than as topics which require to

\* The Author originally intended to illustrate this, and the following conclusions, at considerable length, and to enter into a variety of circumstantial details; but, as the intended illustrations would occupy more than a hundred pages, and as the work has already swelled to a considerable size, he is under the necessity of postponing them for the present.

ee proved by laboured and diffused arguments. Yet, it is a fact, that such doctrines, which are only the means of religion, have been expatiated upon without intermission, as if the simple belief of them were the end of religion; while the great moral object of Christianity has been either entirely overlooked, or thrown into the shade. What should we think of the instructor of youth, who confined the attention of his pupil solely to the characters of the alphabet, and to the pronunciation of a few elementary sounds, and then dismissed him with a general exhortation, to apply them to all the combinations of letters and syllables he might find in every book? Could we ever expect, that, in ordinary cases, such a pupil would either make progress in the art of reading, or use it as the medium of acquiring knowledge? And what shall we think of those who do little more than attempt to explain the axioms of the Christian system, but never show their bearings on the scenery of real life, nor endeavour to extend our views of the providential operations of God, and of the glory of his kingdom? If Christianity consisted merely in abstract disquisitions, and metaphysical dogmas, such a practice might be, in some measure, defensible; but since it is, in every sense of the word, a *practical* system, it is next to trifling with its prominent objects, to confine the range of religious discussions within so narrow bounds as is generally done by many of those who are designated by the term *evangelical*; and argues a complete forgetfulness of the apostle's exhortation, "Therefore, leaving the first principles of the doctrine of Christ, let us go on to perfection," tracing first principles through all their diversified bearings on mortal action, and on Christian contemplation.

One of the great objects of preaching ought, undoubtedly, to be, to investigate the numerous and minute ramifications of human conduct; to explore every avenue of corruption; to endeavour to draw forth from its hiding-place every immoral principle and action, which exerts its pernicious influence in Christian or in general society; and with all the powers of graphical description we can command, to portray them before the eyes of men, in all their repulsive features, and in all their abominations. At the same time, we ought to apply the touch-stone of the divine law to every unchristian propensity and practice; to exhibit its contrariety to the spirit of our holy religion; to show how the principle of love ought to operate in every given case and circumstance, and in the minutest actions of human life; and how very different effects would be produced, were the principles laid down by our Saviour and his apostles, to operate with full effect throughout every department of the moral world. Unless such objects be generally aimed at, and steadily kept in view, in the course of public instruction, religion will be apt

to degenerate into a mere figment, or, at most, into a subject of wrangling, or a matter of curious speculation.

Let no class of religionists presume to tell us, that, if the fundamental doctrines of religion be simply declared, Christian morality will follow as a matter of course; and that, to expatiate on any particular branch of social conduct, is to degenerate into *legal preaching*. If this principle were to be admitted, then all the expostulations and denunciations of the prophets, all the reproofs and exhortations of the apostles, all the moral sermons of our Saviour, and all the minute directions in reference to moral conduct, detailed in every epistle to the Christian churches, may be regarded as egregious trifling. If it be one grand design of revelation to restore mankind from the ruins of the fall, and to reinstate them in that integrity which they at first possessed;—if it was the chief design of "the law and the prophets" to bring forth into action, on the theatre of the world, the two fundamental principles of the moral law, as the Lawgiver himself has expressly stated; (Matt. xxii. 37—40);—if the sweet singer of Israel devoted a large portion of his inspired strains to the celebration of the divine precepts, (Psalm cxix. &c.);—if most of the sermons and parables of our Saviour have a direct bearing on the same important subject;—if the apostle Paul, in his instructions to a Christian minister, enlarged particularly on the duties which should be inculcated on the various ranks and relations of men, (Titus ii. iii.);—if all the apostolic letters to the Christian churches are full of minute directions, in relation to every branch of moral duty;—if heaven be the scene of perfect moral rectitude, where ardent affection towards God, and towards fellow-intelligences, ever reigns—where love, peace, and harmony, eternally prevail;—if the happiness of that world depend upon the absence of moral evil, and the attainment of moral perfection;—if the present world be a state of preparation for the enjoyments of that happier region;—if this preparation consist in having the principles of love to God and to man interwoven through the whole constitution of the mind, and brought forth into action in the diversified scenes of civil and religious intercourse;—if such important effects cannot be produced, unless by laying open to view the latent abominations of the heart, by impelling the moral principles of the gospel through all the avenues and windings of the human passions and affections; and by illustrating, with minute particularity, every subordinate branch of Christian duty;—if these positions be admitted, it will follow, that the duties of Christian morality, so far from being thrown into an obscure corner, ought to occupy a *prominent place* in the range of the ministration of every Christian minister, who is desirous to promote the improvement of society, and the renovation of the world.

In short, we expect no grand moral reformation to be achieved—no commencement of the millennial era of the church, till “the watchmen upon Mount Zion,” with more energy than they have yet displayed, “shall lift up their voice like a trumpet, and show to the house of Jacob their transgressions”—till they “lift it up with strength, and not be afraid” of any suspicions that may be thrown out against their orthodoxy, when they show unto men the path of duty in all its bearings on the relations of time, and on the employments of eternity—till they make the moral principles of Revelation bear, in all their force, not only on the prominent features of social life, but upon every minute ramification of human conduct till every lurking principle of jealousy, envy, avarice, and revenge be made to feel their energy—till even the very amusements of public and domestic life be made to bend to the eternal laws of rectitude, and to carry on their fronts that noble inscription, “**HOLINESS TO THE LORD.**”

II. If the preceding train of sentiments be admitted, we may be directed in our views of the nature and ends of church discipline, and the persons on whom it ought to be exercised.

In a great majority of Christian churches, censures are inflicted chiefly, or solely, on persons guilty of an *external* breach of one or two precepts of the decalogue—only one or two species of violation of the moral law are considered as worthy of cognizance; while the systematic operations of slander, revenge, envy, and avarice—the indications of harsh, sour, and ungovernable tempers, and the absence of Christian candour and affection—circumstances which display the real characters of men far more distinctly than any insulated acts of immorality can do—are either wholly overlooked, or considered as characteristics of very trivial import. The censures to which I allude, are likewise accompanied, in many instances, with a degree of magisterial haughtiness, severity, and unchristian feeling, which is directly repugnant to every amiable, candid, and generous principle. A person guilty, in a single instance, of a breach of the seventh or eighth commandments, will lie under the frown of a religious society for years, and even to the close of his life, notwithstanding every evidence he can give of the sincerity of his repentance, and even be deprived of the means of earning his subsistence; while another may habitually violate almost all the other precepts of the decalogue, and be screened from the discipline of the church. He may be avaricious, cunning, and deceitful; harsh and unfeeling in his conduct; uncandid and uncharitable in his dispositions towards others; proud, selfish, and obstinate in his temper; addicted to slander and to incessant litigations; impatient of control; and boisterous and contentious in his general deportment—and yet be considered as no proper object of censure; and,

though never manifesting the least symptom of penitence, will be viewed as a tolerably fair character in religious society, especially if he has acquired a considerable share of wealth and of influence in general society.—Of such cases and practices, the author had selected a number of striking examples, which the narrow limits to which he is confined in the present work, constrain him, in the mean time, to postpone.

Now, if the general sentiments already thrown out be founded on truth, and on the nature of things, such a practice as that to which we allude, must be absurd, unchristian, and inconsistent with the preservation of the moral purity of religious society. It has this pernicious tendency, among others, that it leads multitudes to imagine, that, if they can keep clear of two or three acts of moral delinquency, they may trample on every divine principle and law with impunity. A poor wretch, under the pressure of poverty, steals a hen or a pocket handkerchief, and, notwithstanding his subsequent repentance, is banished from social intercourse, and held up to execration; while a sanctimonious hypocrite will swindle his neighbour out of a hundred pounds, if no criminal law can take hold of him, and will retain his station in the church, and hold up his face without a blush in the presence of general society. It is obvious, if there be any truth in what we have hitherto stated, that the general tenor of the conduct, and the uniform manifestation of benevolent affections, ought, in every case, to form the grand criterion of a man's being entitled to the character of a Christian; and, that dispositions of an opposite nature habitually displayed, however much overlooked in the general intercourse of life, ought to form a ground of exclusion from the society of the faithful.

III. This subject has a particular bearing upon the divisions which subsist in the religious world, and the grand principles which ought to form a *bond of union* among all who acknowledge the truth of the Christian Revelation.—If the train of thought illustrated in the preceding pages be correct, it will follow, that a cordial union of the various sections of the Christian church is to be expected from the cultivation of the Spirit of Love, more than from any attempt to produce an exact coincidence of opinion on these theological points in which they now differ. Wherever this spirit is found expanding the soul, and governing the affections, it will lead its possessors to view the peculiar opinions of others with candour; to respect their persons; to allow them liberty of thought on all the subordinate ramifications of theological sentiment; and to set a higher value on moral qualifications, and the manifestation of benevolent affections, than on those circumstantial opinions which do not enter into the essence of the Christian scheme. If the professing Christian world were thoroughly investigated, it would be found, that it is owing

more to the absence of this spirit, that Christians stand so much aloof from each other, than to the speculative opinions which they respectively maintain. The prevalent disposition for sneering at other denominations, and the pleasure that seems to be felt in laying open their sores, will generally be found to proceed from a principle of pride, and of self-conceit in regard to our own favourite opinions, some of which, when probed to the bottom, will be found as rotten as our neighbour's. Why are men not as much disposed to pass encomiums on what is sound in the opinions, and laudable in the conduct, of other parties, as they are to censure them for minor peculiarities of sentiment? Why? Because it appears, that many professed Christians take more delight in the exercise of malevolent feelings than of benevolent affections; and are like flies, that pass over the sound parts of a man's body, and fix upon his sores. Till such unchristian dispositions be undermined, and tempers of an opposite description pervade the ranks of Christian society, we can expect no cordial nor lasting union in the visible church, however many ingenious schemes may be formed, to bring about this desirable event. For every effect must have an adequate cause: this cause will be found to consist more in the affection than in opinion; and a union formed on an apparent coincidence of sentiment, unmingled with ardent love and affection, would be unworthy of the name, and would soon be dissolved.

It can form no decisive mark of a man's Christianity, that he recognises the *peculiar opinions* of the Baptists or Pædo-Baptists, of Presbyterians, Episcopalians, or Independents; it is a matter, comparatively of little importance, whether a man believes that Christ was an actual or a virtual Mediator under the Old Testament; whether he be designated the *Son of God* in virtue of his office, or of his nature; whether or not we be guilty of Adam's first sin; whether the transaction which passed between him and his Creator, should be viewed as a law, or as a covenant; whether the ordinance of baptism should be administered by dipping, or by sprinkling, &c. &c.—But it is, unquestionably, a matter of the highest moment, both to the person himself, and to Christian society, that his temper, affections, and conduct, should be in unison with the holy law of God, and that he should display the love which it requires, in all his social, commercial, domestic, and Christian intercourse;—and if such dispositions and conduct were universally to prevail among the various denominations of the religious world, union would soon follow, as a matter of course.—If, therefore, we wish to behold the unhappy divisions of the church ceasing, let us cultivate, with ardour, those amiable and affectionate dispositions which our benevolent religion inculcates, and be more anxious to correct our own mental and moral

aberrations, than to magnify the errors and the faults of others. Let us make every allowance for the effects which education, habit, temper, local circumstances, and particular associations, may have produced on the opinions of our supposed erring brethren; and let us consider, that we ourselves, had we been placed in the same circumstances, might have imbibed the same sentiments. Let us endeavour to acquire clear and well-defined ideas on every subject connected with religion; that we may not contend about trifles, about mere abstract ideas, or the application of particular terms or phrases. Let us keep our eyes fixed on the great and prominent objects of revelation, and on all the subordinate active means by which they may be promoted. Let us consider religion as consisting more in action, than in speculation. Let our love to Christian brethren be founded, not so much on a general coincidence of opinion, as on the resemblance they bear to the Divine image; and then we may confidently expect, that that period will soon approach, when the saints of God "shall see eye to eye," in reference to all the grand bearings of the Gospel scheme, and when the name of Jehovah shall be one throughout all the earth.

IV. We may learn from the subject we have been illustrating, what notions we ought to form of the *NATURE of a future state of happiness, and of the PREPARATION requisite to enable us to engage in its employments.*—The felicity of the future world will not consist simply in a change of place; nor will it consist chiefly in change of sentiment or opinion. Its foundation must be laid in the principle of *Love*, and in the complete renovation of the moral powers of the human mind, without which no celestial scene could produce permanent enjoyment. Although all the theologians who now exist were united in opinion about every article of the system of Divinity; and although they were transported to the most splendid world that revolves around the star *Arcturus*; after the first transports, arising from the novelty and the grandeur of the scene had subsided, they would enjoy little more happiness in that orb, than they do in this terrestrial sphere, unless they were actuated with moral dispositions and affections very different from those which many of them now display. For, not only rancour and malice, but even coldness and indifference to the welfare of others, would prevent happiness from being enjoyed in any region of the material universe. All who believe in the reality of a future world, indulge in anxious wishes to be made happy when they pass from this mortal scene to the world of spirits. Even wicked men, whose consciences frequently forebode evil to them in the other world, indulge the hope that God will ultimately be merciful to them, and admit them to the joys of heaven. But this is impossible, in the very nature of things, unless they be "renewed in the

## PREFACE TO THIS EDITION.

---

**THE** following pages were written under the impression that the visible manifestations of the attributes of the Deity are too frequently overlooked by Christians in their views of the great objects of Religion, and in the worship they offer to the Father of their spirits; and are intended to show, that the Teachers of Religion, in imparting instruction either to the old or to the young, ought to embrace a wider range of illustration, in reference to Divine subjects, than that to which they are usually confined.

Throughout the whole of the discussions contained in this work, the Author has pursued his own train of thought; and, in so doing, he trusts that he has been enabled to render some of his illustrations more interesting to the young and untutored mind than if he had adhered rigidly to the sentiments of others, and to the technical language of science. The sketches of the different sciences are not mere extracts, or compilations, but are, for the most part, original composition—in which it has been his main object to embody as many facts as his limits would permit—in order to excite the inquiring mind to farther investigations into the different departments of physical science.

It is presumed, that no Christian reader will for once imagine, that the views illustrated in this work are intended to be *substituted* in place of the peculiar revelations of the Bible. The object of the volume is to illustrate the harmony which subsists between the system of Nature and the system of Revelation; and to show, that the manifestations of God in the material universe ought to be blended with our views of the facts and doctrines recorded in the volume of Inspiration.

It is taken for granted, throughout the whole range of the following illustrations, that the Scriptures contain a Revelation from Heaven; and, under a firm belief of this important truth, the Author has embellished his work with frequent quotations from the energetic and sublime language of this Sacred Book. It would, therefore, be unfair in any critic, who entertains doubts on this point, to find fault with such quotations, or with the allusions to Bible phraseology which occur, unless they can be shown to be introduced without judgment or discrimination.

The Author has carefully revised every portion of the present edition, and introduced a variety of corrections and modifications. He has likewise introduced additional matter, to the extent of between 20 and 30 pages, and also

several illustrative engravings. In its present form, the Author trusts, that independently of the moral reflections it contains, it will be found to comprise popular descriptions of a greater number of scientific facts than is to be found in any other volume of the same size.

Various topics, originally intended to be illustrated, have been unavoidably omitted. Some of these are stated in the last paragraph of Chapter IV. the illustration of which, in combination with other kindred topics, would fill a volume of nearly the same size as the present. This subject (for which the author has abundance of materials) will be prosecuted in another volume, under the title of **THE PHILOSOPHY OF RELIGION**; and will comprise, among many other objects of discussion, illustrations of the moral relation of intelligent beings to their Creator, and to one another—the physical and rational grounds of those moral laws which the Deity has promulgated—the views which science affords of the incessant energies of Creating Power, and of the grand and multifarious objects over which Divine Providence presides—the relation of science to a future state, and of the aids which the discoveries of science afford, for enabling us to form a conception of the perpetual improvement of the celestial inhabitants in knowledge and felicity. These subjects will be illustrated by a variety of interesting details of facts, in relation to the system of nature, the history of nations, and the moral state of Christian and general society

# CONTENTS.

INTRODUCTION	Page 17
Necessity of Revelation. Folly of discarding the Science of Nature from Religion.	
Beneficial Effects which flow from the study of the Works of God.	

## CHAPTER I.

### OF THE NATURAL ATTRIBUTES OF THE DEITY.

#### SECTION I.

ON THE RELATION OF THE NATURAL ATTRIBUTES OF THE DEITY TO RELIGION	25
The Christian Religion founded on the Natural Attributes of God. His Power as interesting a subject as his Mercy—Illustrated in two instances. Evils which arise from imperfect conceptions of Divine Power. Defects in Religious Instruction on this subject. Sources of Illustration.	

#### SECTION II.

ILLUSTRATIONS OF THE OMNIPOTENCE OF THE DEITY	28
The material world exhibits a more striking display of this Perfection than the supernatural facts recorded in Scripture. <i>Immense quantity of Matter in the universe.</i> Mode of acquiring the most comprehensive conception of the bulk of the Earth—its variety of scenery—its mass of solid matter. Magnitude of the bodies which compose the Solar System. Magnitude and number of the Stars. Procedure of the mind in acquiring the most impressive conceptions of such august objects. Reflections. <i>Rapid Motions of the Celestial Bodies.</i> How we acquire the ideas of relative velocities—weight of the Earth—immense physical forces—Grandeur of the motion of Saturn—immense number of bodies impelled through the heavens—Reflections. <i>Immense Spaces which surround the Heavenly Bodies.</i> Popular illustration of the Motions of the Earth and Heavens. Extract from Dr. Ridgeley, with remarks. Universe intended to <i>adumbrate</i> the Attributes of God, and to make a sublime impression on created beings. Similar trains of thought suggested in the Scriptures. <i>Moral Effects</i> of such contemplations. <i>Humility.</i> Folly of pride—low rank of man in the scale of being. <i>Reverence and Veneration</i> —Reason why mankind feel so little veneration of God—how it may be increased. The Deity unsearchable. <i>Hope and Confidence</i> in the prospect of futurity—Resurrection—Scenes of Eternity.	

#### SECTION III.

ON THE WISDOM AND INTELLIGENCE OF THE DEITY	31
Wisdom defined—Displayed in the Structure of the Solar System. Distance of the Sun. Rotation of the Planets—Principal reason why such a motion exists. Wisdom displayed in other Systems. Minute displays of this attribute cannot be traced in the heavens. Wisdom, as displayed in the constitution of our globe—adjustment of its solid parts to the necessities of the beings which inhabit it. <i>Mountains</i> , their uses—exist in other worlds. Diversity of colour—argument for a plurality of worlds—general colour which prevails in the scene of nature— <i>Water</i> , its use in the system of nature—its composition, evaporation—motion of the liquid element—its beneficial effects. The <i>Atmosphere</i> —its weight and pressure—its component parts—its various properties—necessary to animal life, flame, sound, twilight—wisdom displayed in its constitution. Expansion of water in the act of freezing.	

**VARIETY OF NATURE** . . . . . 77

Vegetables—their number and variety. Animals—variety in their organization. Eyes of insects—their exquisite mechanism. Subterraneous Regions. Atmosphere. The Variety of Nature affords a faint idea of the *infinity* of the Creator. Illustrated in the number of animal parts and functions. Reflection. Variety the foundation of our judgments. Beauty and sublimity of Nature. Primeval state of our globe—other worlds.

**Mechanism of Animated Beings** . . . . . 89

**STRUCTURE OF THE HUMAN EYE**—its coats, humours, muscles, orbit, and motions. Wisdom displayed in its construction. *Light*—its velocity, minuteness, colours, and adaptation to the eye. **MANNER IN WHICH VISION IS PERFORMED**—explained by a figure, and an experiment—illustrated by the view from Salisbury Craigs. Multitude of rays which flow from every object—smallness of the image on the retina, illustrated by calculation—what proportion of the solar light falls on our globe—Reflections. Mechanism for viewing near and distant objects—contraction and dilatation of the pupil—distance at which we see distinctly. Summary view of adaptations in the structure of the eye. Eyes of superior intelligences. Visual organs of the inferior animals. *Mechanism of the Bones* illustrated—exemplified in the joints of the fingers, the wrist, and the movements of which the *head* is susceptible. Moral Reflections on the impropriety of overlooking the Divine Wisdom in the system of nature.

**SECTION IV.**

**ON THE GOODNESS OR BENEVOLENCE OF THE DEITY** . . . . . 111

Benevolence of God in relation to *Man*—considered as a depraved intelligence. *Mercy* displayed in the system of nature. Benevolence as displayed towards the lower animals. Extract from Dr. Paley. General Reflections.

**CHAPTER II.**

**A CURSORY VIEW OF SOME OF THE SCIENCES WHICH ARE RELATED TO RELIGION AND CHRISTIAN THEOLOGY.**

**INTRODUCTION.** Extensive range of Theology. Bad effects of setting Religion in opposition to Science. Harmony of the operations of God in Nature and Revelation 117

**NATURAL HISTORY** . . . . . 110

Its extensive range. Outline of its principal objects—on the surface, and in the interior recesses of the earth—in the atmosphere—the vegetable, mineral, and animal kingdoms—and in the region of the heavens. Description of the Banian Tree. Reflections. Monkey Bread Tree. Splendour and felicity of insect life. Invisible worlds—infinity of the universe. *Religious tendency of this Science.* It affords a manifestation of the Deity, and expands our conceptions of his operations—ennobles the human mind.—Recommended by the Sacred writers.

**GEOGRAPHY** . . . . . 134

Its object—Figure of the Earth—Proofs of its spherical form. Relation which the discovery of the figure of the earth bears to the plan of Providence. Magnitude and natural divisions of the earth. General features of its surface. *Mountains*—their general ranges, and the sublime scenes they exhibit. The *Ocean*—its extent, depth, bottom, and motions. *Rivers*—their number, size, and the quantity of water they pour into the ocean. How they are supplied—their use in the system of nature. *Artificial* division of the earth. Number and variety of its inhabitants. Number which have existed since the Creation—number at the resurrection, and the space they would occupy. Number which the earth would contain—strictures on Malthus. *Utility of the study of Geography to Religion*—to Directors of Missionary Societies—to Private Christians. Grandeur of its physical objects—utility of its moral facts.

**GEOLOGY** . . . . . 157

Its object and connexion with religion—an interesting subject of inquiry. Materials which compose the crust of our globe. Various geological phenomena. Organic remains—Mammoth, Tapir, Elk, Megatherium, &c. Geological deductions not inconsistent with the Mosaic History—Genesis i. 1, 2. explained. Short duration of the earth

## CONTENTS.

in its present form. The Deluge, and its effects on the earth's strata. Marine shells, &c. Grand and terrific objects which this science exhibits—illustrate the sublime descriptions of the Deity recorded in the Scriptures.

### ASTRONOMY - - - - - 169

Its sublime objects. Apparent motions of the Sun—of the Moon. Eclipses of the Sun and Moon. Apparent motion of the starry heavens. Stars and planets seen in the day-time, and with what powers of the telescope they may be distinguished. Apparent revolution of the celestial vault indicates Almighty power. Stars never shift their relative positions. Solar System. The Sun—his size and probable destination illustrated—his spots and atmosphere—different kind of rays emitted from his body—his distance illustrated. Mercury—his size, rotation, quantity of light and heat, &c. Proportions of caloric on the different planets. Venus—her size, phases, mountains, transits, and general phenomena. Original observations on, and mode by which her diurnal rotation may be determined. Earth—proofs of its annual and diurnal motions. The moon—description of her majestic mountain scenery, luminous spots, celestial appearances, illuminating power, superficial contents, &c. Mars—his distance, atmosphere, luminous zone, &c. New Planets—Ceres, Pallas, Juno, and Vesta—their anomalies, singularities, and probable origin. Meteoric Stones. Jupiter—his bulk, rotation, belts, and the appearances of his moons. Saturn—his figure, belts, moons, and quantity of light. His Rings, their dimensions, motion, and phenomena—illustrated by a figure. Splendour of the firmament, as viewed from this planet (see the engraving.) Herschel—his distance, size, and quantity of light. Comets—their tails, velocity, orbits, size, and number. New Comet. Motion of the solar system in absolute space—its destination—plurality of worlds intimated in Scripture. The Fixed Stars—their distance illustrated—their arrangement, changes—moral reflections. Relation of Astronomy to Religion—moral effects which its objects have a tendency to produce—criminality of overlooking the works of God, &c.

### NATURAL PHILOSOPHY - - - - - 201

Its objects and different departments. Mechanics—subjects it embraces, and its importance to the improvement of mankind. Hydrostatics—its leading principles and uses, illustrated by figures. Pneumatics—its principles, and the experiments by which they are illustrated. Acoustics. Optics—leading facts and principles of this science. Burning-glasses, &c. Electricity—its nature, phenomena, effects, and agency in the system of nature. Galvanism—its singular effects on metals, &c. and on the animal system—various facts which it explains. Magnetism—its various phenomena and effects. Relation of Natural Philosophy to Religion—its inventions meliorate the condition of mankind—illustrated in the case of the electric fluid—it undermines the influence of superstition—unfolds the incessant agency of God—indifference to this subject unreasonable.

### CHEMISTRY - - - - - 219

Its objects, and present dignified station. General forms of matter—simple and compound substances. Caloric—its sources and properties. Oxygen, its properties and combinations—nitrous oxide, its singular effects. Nitrogen, its effects on flame and animal life. Hydrogen, its properties and uses. Carbon, its nature, combinations, and antiseptic properties. Sulphur, its origin, combinations, and properties. Phosphorus, history of its discovery—how prepared—curious experiments with this substance—Phosphoric phenomena in the system of nature. Connexion of this science with Religion—it displays the wisdom and benevolence of God, and the mode of his present and future operations—improves the condition of man—and carries forward our views to a more glorious and auspicious era.

### ANATOMY AND PHYSIOLOGY - - - - - 231

Their general object—human body, its different parts and divisions. Bones, their number, form, and positions. Muscles, their nature, use, and extraordinary strength. Heart and blood-vessels, and the circulation of the blood. Respiration—curious structure of the lungs. Digestion. Perspiration. Sensation, and the system of nerves. Summary. Moral reflections—this branch of study teaches us our dependence on a Superior Power—and excites to gratitude.

### HISTORY - - - - - 241

Its objects, advantages, and connexion with Religion. Connexion of the sciences and of the Divine dispensations with each other. Concluding remarks.

## CHAPTER III.

THE RELATION WHICH THE INVENTIONS OF ART BEAR TO THE  
OBJECTS OF RELIGION.

Art of Printing, its origin and beneficial effects—Dr. Church's Improvements in. Art of Navigation. Mariner's Compass, its discovery and use. The Telescope, its invention, and the discoveries made by it—serves instead of a celestial vehicle. Magnifying powers of Dr. Herschel's Telescopes. The Microscope, and the views it exhibits of the wisdom of God. Steam Navigation, its utility in promoting the intercourse of mankind, and its relation to the objects of religion. Air Balloons, utility of, when arrived at perfection—proposed improvement in. History of their invention—Lunardi's ascent—the Parachute. Acoustic Tunnels. Experiments on the Conveyance of Sound. M. Biot's remarkable experiment. Don Gautier's experiment and suggestion. Conclusions in reference to the extensive conveyance of sound. Practical remarks—utility of the arts in relation to the Millennial Era - - - - - 114

## CHAPTER IV.

SCRIPTURAL FACTS ILLUSTRATED FROM THE SYSTEM  
OF NATURE.

I. Science may frequently serve as a guide to the true interpretation of Scripture. Canon or rule for Scripture interpretation—illustrated. II. The Depravity of Man illustrated, from a consideration of the state of the interior strata of the earth. Volcanoes, and the terrible ravages they produce. Earthquakes, and their dreadful effects. Thunderstorms, tempests, and hurricanes. General Reflections on this subject. III. The Resurrection illustrated. Transformations of Insects. Indestructibility of matter—conclusions from this fact. IV. General Conflagration. Concluding reflections. Topics omitted in this volume - - - - - 124

## CHAPTER V.

BENEFICIAL EFFECTS WHICH WOULD RESULT FROM CONNECTING  
SCIENCE WITH RELIGION.

I. The *variety* of topics would allure the attention of intelligent minds to religious subjects. Principle of novelty intended by the Creator to be gratified—illustrated in the variety which appears in the earth, the heavens, and the volume of Revelation. II. Science enables us to take an *extensive survey of the empires of God*—illustrates many sublime passages of the Bible—qualifies us for complying with several Divine Injunctions—danger of selfishness and indifference in this respect. Our conceptions of God depend on our views of the extent of his dominions. III. Science enlarges our views of the *operations of Providence*, in relation to the past and present scenes of the world. The economy of the inferior animals. The *physical* and *moral* economy of the celestial worlds. IV. Science, blended with Religion, would produce a general expansion of mind, and liberality of views, in reference to the opinions and actions of men, and to the works and the ways of God, illustrated at large. V. It would induce a spirit of *piety*, and profound *humility*. Sources of piety—illustrated by an example. Humility—illustrated by the examples of Mr. Boyle, of Sir Isaac Newton, and of superior intelligences. General conclusions - 124

INTRODUCTION.

ON the subject of RELIGION, mankind have, in all ages, been prone to run into extremes. While some have been disposed to attach too much importance to the mere exertions of the human intellect, and to imagine that man, by the light of unassisted reason, is able to explore the path to true wisdom and happiness,—the greater part of religionists, on the other hand, have been disposed to treat scientific knowledge, in its relation to religion, with a degree of indifference bordering upon contempt. Both these dispositions are equally foolish and preposterous. For he who exalts human reason, as the only sure guide to wisdom and felicity, forgets, that man, in his present state, is a *depraved* intelligence, and, consequently, liable to err; and that all those who have been left solely to its dictates, have uniformly failed in attaining these desirable objects. During a period of more than 5,800 years, the greater part of the human race have been left solely to the guidance of their rational powers, in order to grope their way to the Temple of Knowledge, and the Portals of Immortality; but what has been the result of all their anxious researches? Instead of acquiring correct notions of the Great Author of their existence, and of the nature of that homage which is due to his perfections, “they have become vain in their imaginations, and their foolish hearts have been darkened. Professing themselves to be wise, they have become fools; and have changed the glory of the Incorruptible God into an image made like to corruptible man, and to four-footed beasts, and creeping things.” Instead of acquiring correct views of the principles of moral action, and conducting themselves according to the eternal rules of rectitude, they have displayed the operation of the most diabolical passions, indulged in continual warfare, and desolated the earth with rapine and horrid carnage; so that the history of the world presents to our view little more than a series of revolting details of the depravity of our species, and of the wrongs which one tribe of human beings has wilfully inflicted upon another.

This has been the case, not only among a few uncultivated hordes on the coasts of Africa, in the plains of Tartary, and the wilds of America, but even among those nations which stood highest in the ranks of civilization, and of science.—

The ancient Greeks and Romans, who boasted of their attainments in philosophy, and their progress in the arts, entertained the most foolish, contradictory, and unworthy notions of the Object of Divine worship, of the requirements of religion, and of the eternal destiny of man. They adored a host of divinities characterized by impiety, fraud, injustice, falsehood, lewdness, treachery, revenge, murder, and every other vice which can debase the human mind, instead of offering a tribute of rational homage to that Supreme Intelligence who made and who governs the universe. Even their priests and philosophers indulged in the most degrading and abominable practices, and entertained the most irrational notions in regard to the origin of the universe, and the moral government of the world. Most of them denied a future state of retribution, and all of them had their doubts respecting the reality of an immortal existence: and as to the doctrine of a resurrection from the dead, they never dreamed of such an event, and scouted the idea, when proposed to them, as the climax of absurdity. The glory to which their princes and generals aspired, was, to spread death and destruction among their fellow-men—to carry fire and sword, terror and dismay, and all the engines of destruction, through surrounding nations—to fill their fields with heaps of slain—to plunder the survivors of every earthly comfort, and to drag captive kings at their chariot wheels—that they might enjoy the splendour and the honours of a triumph. What has been now stated, with regard to the most enlightened nations of antiquity, will equally apply to the present inhabitants of China, of Hindostan, of the Japanese Islands, of the Birman Empire, and of every other civilized nation on which the light of revelation has never shone—with this additional consideration, That they have enjoyed an additional period of 1800 years for making further investigations; and are, at this moment, as far from the object of their pursuit as when they first commenced their researches; and not only so, but some of these nations, in modern times, have mingled with their abominable superstitions and idolatries many absurdities and horrid cruelties, which were altogether unknown among the Greek and Roman population.

Such are the melancholy results to which men have been led, when left to the guidance

---

## INTRODUCTION.

ON the subject of RELIGION, mankind have, in all ages, been prone to run into extremes. While some have been disposed to attach too much importance to the mere exertions of the human intellect, and to imagine that man, by the light of unassisted reason, is able to explore the path to true wisdom and happiness,—the greater part of religionists, on the other hand, have been disposed to treat scientific knowledge, in its relation to religion, with a degree of indifference bordering upon contempt. Both these dispositions are equally foolish and preposterous. For he who exalts human reason, as the only sure guide to wisdom and felicity, forgets, that man, in his present state, is a depraved intelligence, and, consequently, liable to err; and that all those who have been left solely to its dictates, have uniformly failed in attaining these desirable objects. During a period of more than 5,800 years, the greater part of the human race have been left solely to the guidance of their rational powers, in order to grope their way to the Temple of Knowledge, and the Portals of Immortality; but what has been the result of all their anxious researches? Instead of acquiring correct notions of the Great Author of their existence, and of the nature of that homage which is due to his perfections, “they have become vain in their imaginations, and their foolish hearts have been darkened. Professing themselves to be wise, they have become fools; and have changed the glory of the Incorruptible God into an image made like to corruptible man, and to four-footed beasts, and creeping things.” Instead of acquiring correct views of the principles of moral action, and conducting themselves according to the eternal rules of rectitude, they have displayed the operation of the most diabolical passions, indulged in continual warfare, and desolated the earth with rapine and horrid carnage; so that the history of the world presents to our view little more than a series of revolting details of the depravity of our species, and of the wrongs which one tribe of human beings has wilfully inflicted upon another.

This has been the case, not only among a few uncultivated hordes on the coasts of Africa, in the plains of Tartary, and the wilds of America, but even among those nations which stood highest in the ranks of civilization, and of science.—

The ancient Greeks and Romans, who boasted of their attainments in philosophy, and their progress in the arts, entertained the most foolish, contradictory, and unworthy notions of the Object of Divine worship, of the requirements of religion, and of the eternal destiny of man. They adored a host of divinities characterized by impiety, fraud, injustice, falsehood, lewdness, treachery, revenge, murder, and every other vice which can debase the human mind, instead of offering a tribute of rational homage to that Supreme Intelligence who made and who governs the universe. Even their priests and philosophers indulged in the most degrading and abominable practices, and entertained the most irrational notions in regard to the origin of the universe, and the moral government of the world. Most of them denied a future state of retribution, and all of them had their doubts respecting the reality of an immortal existence: and as to the doctrine of a resurrection from the dead, they never dreamed of such an event, and scouted the idea, when proposed to them, as the climax of absurdity. The glory to which their princes and generals aspired, was, to spread death and destruction among their fellow-men—to carry fire and sword, terror and dismay, and all the engines of destruction, through surrounding nations—to fill their fields with heaps of slain—to plunder the survivors of every earthly comfort, and to drag captive kings at their chariot wheels—that they might enjoy the splendour and the honour of a triumph. What has been now stated, with regard to the most enlightened nations of antiquity, will equally apply to the present inhabitants of China, of Hindostan, of the Japanese Islands, of the Birman Empire, and of every other civilized nation on which the light of revelation has never shone—with this additional consideration, That they have enjoyed an additional period of 1800 years for making farther investigations; and are, at this moment, as far from the object of their pursuit as when they first commenced their researches; and not only so, but some of these nations, in modern times, have mingled with their abominable superstitions and idolatries many absurdities and horrid cruelties, which were altogether unknown among the Greek and Roman population.

Such are the melancholy results to which men have been led, when left to the guidance

of unassisted reason, in the most interesting and important of all investigations. They have wandered in the mazes of error and delusion; and their researches, instead of directing and expanding our religious views, have tended only to bewilder the human mind, and to throw a deeper shade of intellectual gloom over our apostate world. After a period of six thousand years has been spent in anxious inquiries after the path to true knowledge and happiness—Ignorance, Superstition, Idolatry, Vice, and Misery still continue to sway their sceptre over the great majority of the human race; and, if we be allowed to reason from the past to the future, we may rest assured, that while mankind are destitute of a Guide superior to the glimmerings of depraved reason, they would be no nearer the object of their pursuit, after the lapse of *sixty thousand years*, than at the present moment. It is only in connection with the discoveries of Revelation, that we can expect that the efforts of human reason and activity will be successful in abolishing the reign of Ignorance and degrading Superstition—in illuminating the benighted tribes of the Pagan World—and in causing “Righteousness, and Order, and Peace, to spring forth before all the nations.” Though the Christian Religion has never yet been fully understood and recognised in all its aspects and bearings, nor its requirements been cordially complied with, by the great body of those who profess to believe in its Divine origin, yet it is only in those nations who have acknowledged its authority, and in some measure submitted to its dictates, that any thing approximating to just conceptions of the Supreme Intelligence, and of his moral government, is found to prevail.

But, on the other hand, though the light of Nature is of itself a feeble and insufficient guide, to direct us in our views of the Supreme Intelligence, and of our eternal destination, yet it is a most dangerous and delusive error to imagine, that Reason, and the study of the material world, ought to be discarded from the science of religion. The man who would discard the efforts of the human intellect and the science of Nature from Religion, forgets—that He who is the Author of human redemption, is also the Creator and Governor of the whole system of the material universe—that it is one end of that moral renovation which the Gospel effects, to qualify us for contemplating aright the displays of Divine Perfection which the works of creation exhibit—that the visible works of God are the principal medium by which he displays the attributes of his nature to intelligent beings—that the study and contemplation of these works employ the faculties of intelligences of a superior order\*—that man, had he remained in primeval innocence, would have been chiefly employed in such contemplations—

that it is one main design of Divine Revelation to illustrate the operations of Providence, and the agency of God in the formation and preservation of all things—and that the Scriptures are full of sublime descriptions of the visible creation, and of interesting references to the various objects which adorn the scenery of Nature. Without the cultivation of our reasoning powers, and an investigation of the laws and economy of Nature, we could not appreciate many of the excellent characters, the interesting aspects, and the sublime references of revealed religion: we should lose the full evidence of those arguments by which the existence of God and his attributes of Wisdom and Omnipotence are most powerfully demonstrated: we should remain destitute of those sublime conceptions of the perfections and agency of Jehovah which the grandeur and immensity of his works are calculated to inspire. we should never perceive, in its full force, the evidence of those proofs on which the Divine authority of Revelation is founded: we could not give a rational interpretation of the spirit and meaning of many parts of the Sacred Oracles: nor could we comply with those positive commands of God which enjoin us to contemplate the wonder of his power, to “meditate on all his works, and to talk of all his doings.”

Notwithstanding these and many other considerations, which show the folly of overlooking the visible manifestations of Deity in the exercises of Religion, it has long been the practice of certain theologians to depreciate the wonderful works of Jehovah, and to attempt to throw them into the shade, as if they were unworthy of our serious contemplation. In their view, to be a bad philosopher is the surest way to become a good Christian, and to expand the views of the human mind, is to endanger Christianity, and to render the design of religion abortive. They seem to consider it as a most noble triumph to the Christian cause, to degrade the material world, and to trample under foot, not only the earth, but the visible heavens. as an old, shattered, and corrupted fabric, which no longer demands our study or admiration. Their expressions, in a variety of instances, would lead us almost to conclude, that they considered the economy of Nature as set in opposition to the economy of Redemption, and that it is not the same God that contrived the system of Nature, who is also the “Author of eternal salvation to all them that obey him.”

It is, unquestionably, both foolish and impious to overlook or to undervalue any of the modes by which the Divine Being has been pleased to make known his nature and perfections to mankind. Since he has given a display of his “Eternal Power and Godhead” in the grand theatre of nature, which forms the subject of scientific investigation, it was surely never intended, and would ill comport with reverence for its adorable Author, that such magnificent dis-

\* Rev. iv. 11 xv 2, &c.

plays of his Power, Wisdom, and Beneficence, as the material universe exhibits, should be treated, by his intelligent offspring, with indifference or neglect. It becomes us to contemplate, with adoring gratitude, every ray of our Creator's glory, whether as emanating from the light of Revelation, or as reflected from the scenery of nature around us, or as descending from those regions where stars unnumbered shine, and planets and comets run their solemn rounds. Instead of contrasting the one department of knowledge with the other, with a view of depreciating the science of nature, our duty is, to derive from both as much information and instruction as they are calculated to afford; to mark the harmony of the revelations they respectively unfold; and to use the revelations of nature for the purpose of confirming and amplifying, and carrying forward our views of the revelation contained in the Sacred Scriptures.

With regard to the revelation derived from the Sacred Records, it has been imagined by some, that it has little or no reference to the operations of the material system, and that, therefore, the study of the visible works of God can be of little importance in promoting religious knowledge and holy affections. In the sequel of this volume, I shall endeavour to show, that this sentiment is extremely fallacious, and destitute of a foundation. But, in the mean time, although it were taken for granted, it would form no argument against the combination of science with religion. For it ought to be carefully remarked, that Divine Revelation is chiefly intended to instruct us in the knowledge of those truths which interest us as subjects of the *moral administration* of the Governor of the world,—or, in other words, as apostate creatures, and as moral agents. Its grand object is to develop the openings and bearings of the plan of Divine Mercy; to counteract those evil propensities and passions which sin has introduced; to inculcate those holy principles and moral laws which tend to unite mankind in harmony and love; and to produce those amiable tempers and dispositions of mind, which alone can fit us for enjoying happiness either in this world, or in the world to come. For this reason, doubtless, it is, that the *moral* attributes of Deity are brought more prominently into view in the Sacred Volume, than his *natural* perfections; and that those special arrangements of his Providence, which regard the *moral* renovation of our species, are particularly detailed; while the immense extent of his universal kingdom, the existence of other worlds, and their moral economy, are but slightly hinted at, or veiled in obscurity. Of such a Revelation we stood in need; and had it chiefly embraced subjects of a very different nature, it would have failed in supplying the remedies requisite for correcting the disorders which sin has introduced among mankind—But, surely, it was never

intended, even in a religious point of view, that the powers of the human mind, in their contemplations and researches, should be bounded by the range of subjects comprised in that revelation, which is purely, or chiefly, of a *moral* nature, since the Almighty has exhibited so magnificent a spectacle in the universe around us, and endowed us with faculties adequate to the survey of a considerable portion of its structure, and capable of deducing from it the most noble and sublime results. To walk in the midst of this "wide extended theatre," and to overlook, or to gaze with indifference on those striking marks of Divine omnipotence and skill, which every where appear, is to overlook the Creator himself, and to condemn the most illustrious displays he has given of his eternal power and glory. That man's religious devotions are much to be suspected, whatever show of piety he may affect, who derives no assistance, in attempting to form some adequate conceptions of the object of his worship, from the sublime discoveries of astronomical science; from those myriads of suns and systems which form but a small portion of the Creator's immense empire!\* The professing Christian, whose devotional exercises are not invigorated, and whose conceptions of Deity are not extended, by a contemplation of the magnitude and variety of his works, may be considered as equally a stranger to the more elevated strains of piety, and to the noble emotions excited by a perception of the beautiful and the sublime.

"The works of the Lord," says an inspired writer, "are great, and are sought out by all those who have pleasure therein." They all bear the stamp of Infinite Perfection, and serve as so many sensible mediums to exalt and expand our conceptions of him, whose invisible glories they represent and adumbrate. When contemplated in connection with the prospects opened by Divine Revelation, they tend to excite the most ardent desires after that state of enlarged vision, where the plans and operations of Deity will be more clearly unfolded—and to prepare us for bearing a part in the immortal hymn of the church triumphant:—"Great and marvellous are thy works, Lord God Almighty, just and true are thy ways, thou King of Saints." The most illustrious characters that have adorned our race in all ages, have been struck with the beauty and magnificence of the visible creation, and have devoted a certain portion of their

\* As some readers seem to have mistaken the Author's meaning, in this and similar passages, it may be proper to state, that his meaning is not—that a knowledge of natural science is *essential* to genuine piety; but, that the person *who has an opportunity of making himself acquainted with the science of nature*, and of contemplating the wonders of the heavens in their true light, and who does not find his views of the Creator expanded, and his religious emotions elevated, by such studies, has reason to call in question the nature and the sincerity of his devotional feelings.

time and attention in investigating its admirable economy and arrangement : and there can be no question, that a portion of our thoughts devoted to the study of the wondrous works of the Most High, must ultimately be conducive to the improvement of our intellectual powers, to our advancement in the Christian life, and to our preparation for the exalted employments of the eternal world.

In fine, since the researches of modern times have greatly enlarged our views of the System of Universal Nature, and of the vast extent to which the operations of the Creator are carried on in the distant regions of space,—since the late discoveries of Naturalists and Experimental Philosophers, with respect to the constitution of the atmosphere, water, light, heat, the gases, the electric, galvanic and magnetic fluids, and the economy and instincts of animated beings, have opened to our view a bright display of Divine Wisdom, in the contrivance and arrangement of the different parts of our terrestrial habitation,—since improvements in the useful arts have kept pace with the progress of science, and have been applied to many beneficial purposes, which have ultimately a bearing on the

interests and the progress of religion—since a general desire to propagate the truths of Christianity in Heathen lands now animates the mass of the religious world—since the nations of both Continents are now aroused to burst asunder the shackles of despotism, and to inquire after rational liberty and mental improvement,—and since all these discoveries, inventions, and movements, and the energies of the human mind, from which they spring, are under the direction and control of that Omnipotent Being who made and who governs the world—they ought to be considered as parts of those Providential arrangements, in the progress of which He will ultimately accomplish the illumination of our benighted race, and make the cause of righteousness and truth to triumph among all nations. And, therefore, the enlightened Christian ought thankfully to appreciate every exhibition, and every discovery, by which his conceptions of the attributes of God, and of the grandeur of his works, may be directed and enlarged, in order that he may be qualified to “speak of the honour of his majesty, and talk of his power ; to make known to the sons of men his mighty acts, and the glorious majesty of his kingdom.”

## CHAPTER I.

### OF THE NATURAL ATTRIBUTES OF THE DEITY, WITH PARTICULAR ILLUSTRATIONS OF HIS OMNIPOTENCE AND WISDOM.

#### SECTION I.

##### *On the Relation of the Natural Attributes of DEITY to RELIGION.*

A FIRM conviction of the existence of God, and a competent knowledge of his natural perfections, lie at the foundation of all religion, both natural and revealed. In proportion as our views of the perfections of Deity are limited and obscure, in a similar proportion will be our conceptions of all the relations in which he stands to his creatures, of every part of his providential procedure, and of all the doctrines and requirements of revealed religion.

By the natural or essential attributes of God, we understand such perfections as the following:—His Eternity, Omnipresence, Infinite Knowledge, Infinite Wisdom, Omnipotence, and Boundless Beneficence. These are the characters and attributes of Deity, which, we must suppose, form the chief subjects of contemplation to angels, and to all other pure intelligences—and in investigating the displays of which, the sons of Adam would have been chiefly employed, had they continued in primeval innocence. These attributes form the ground-work of all these gracious relations in which the God of salvation stands to his redeemed people in the economy of redemption—they lie at the foundation of the whole Christian superstructure—and were they not recognized as the corner-stones of that sacred edifice, the whole system of the Scripture Revelation would remain a baseless fabric. The full display of these perfections will be exhibited in the future world—the contemplation of this display will form one of the sublime employments “of the saints in light”—and to prepare us for engaging in such noble exercises, is one of the chief designs of the salvation proclaimed in the Gospel.

The Christian Revelation ought not to be considered as superseding the Religion of Nature, but as carrying it forward to perfection. It introduces the Deity to us under new relations, corresponding to the degraded state into which we have fallen. It is superadded to our natural relations to God, and takes it for granted, that

these natural relations must for ever subsist. It is true, indeed, that the essential attributes of God, and the principles of Natural Religion, cannot be fully discovered without the light of Revelation, as appears from the past experience of mankind in every generation; but it is equally true, that, when discovered by the aid of this celestial light, they are of the utmost importance in the Christian system, and are as essentially connected with it, as the foundation of a building is with the superstructure. Many professed Christians, however, seem to think, and to act, as if the Christian Revelation had annulled the natural relations which subsist between man and the Deity; and hence the zealous outcry against every discussion from the pulpit, that has not a direct relation to what are termed the doctrines of grace. But nothing, surely, can be more absurd than to carry out such a principle to all its legitimate consequences. Can God ever cease to be Omnipotent, or can man ever cease to be dependent for existence on his infinite power? Can the Divine Being ever cease to be Omnipresent and Omniscient, or can man ever cease to be the object of his knowledge and superintendence? Can Infinite Wisdom ever be detached from the Almighty, or can man ever be in a situation where he will not experience the effects of his wise arrangements? Can Goodness ever fail of being an attribute of Jehovah, or can any sentient or intelligent beings exist that do not experience the effects of his bounty? In short, can the relation of *Creature* and of *Creator* ever cease between the human race, in whatever moral or physical situation they may be placed, and that almighty Being, “who giveth to all, life and breath, and all things?” If none of these things can possibly happen, then the relations to which we refer must be eternal and unchangeable, and must form the basis of all the other relations in which we can possibly stand to the Divine Being, either as apostate or as redeemed creatures; and, therefore, they ought to be exhibited as subjects for our frequent and serious contemplation, as religious and moral agents. But, unless we make such topics a distinct subject of attention, and endeavour to acquire a clear and comprehensive conception of our natural relations to God, we can never form a

clear conception of those new and interesting relations into which we have been brought by the mediation of Jesus Christ.

If man had continued in his primitive state of integrity, he would have been for ever exercised in tracing the Power, the Beneficence, and other attributes of Deity, in the visible creation alone. Now that his fallen state has rendered additional revelations necessary, in order to secure his happiness—is he completely to throw aside those contemplations and exercises which constituted his chief employment, while he remained a pure moral intelligence? Surely not. One great end of his moral renovation, by means of the Gospel, must be, to enable him *to resume his primitive exercises*, and to qualify him for more enlarged views and contemplations of a similar nature, in that future world, where the physical and moral impediments which now obstruct his progress will be completely removed.

It appears highly unreasonable, and indicates a selfish disposition of mind, to magnify one class of the Divine attributes at the expense of another, to extol, for example, the Mercy of God, and neglect to celebrate his Power and Wisdom—those glorious perfections, the display of which, at the formation of our globe, excited the rapture and admiration of angels, and of innocent man. All the attributes of God are *equal*, because all of them are *infinite*; and, therefore, to talk of *darling* attributes in the Divine Nature, as some have done, is inconsistent with reason, unwarranted by Scripture, and tends to exhibit a distorted view of the Divine character. The Divine mercy ought to be celebrated with rapture by every individual of our fallen race; but with no less rapture should we extol the Divine Omnipotence; for the designs of mercy cannot be accomplished without the intervention of Infinite Power. All that we hope for, in consequence of the promises of God, and of the redemption accomplished by Jesus Christ, must be founded on the conception we form of the operations of Omnipotence. An example or two may not be unnecessary for illustrating this position.

We are warranted, by the sacred oracles, to entertain the hope, that these mortal bodies of ours, after they have mouldered in the dust, been dissolved into their primary elementary parts, and become the prey of devouring reptiles, during a lapse of generations or of centuries,—shall spring forth from the tomb to new life and beauty, and be arrayed in more glorious forms than they now wear; yea, that all the inhabitants of our globe, from Adam to the end of time, though the bodies of thousands of them have been devoured by cannibals, have become the food of fishes and of beasts of prey, and have been burnt to cinders, and their ashes scattered by the winds, over the different regions of sea and land,—shall be reanimated by the voice of the Son of God, and shall appear, each in his proper person and identical

body, before God, the Judge of all. Now, the firmness of our hope of so astonishing an event, which seems to contradict all experience, and appears involved in such a mass of difficulties and apparent contradictions, must be in proportion to the sentiments we entertain of the Divine Intelligence, Wisdom, and Omnipotence. And where are we to find the most striking visible displays of these perfections, except in the actual operations of the Creator, within the range of our view in the material world?

Again, we are informed, in the same Divine records, that, at some future period, the earth on which we now dwell shall be wrapt up in devouring flames, and its present form and constitution for ever destroyed; and its redeemed inhabitants, after being released from the grave, shall be transported to a more glorious region; and that “new heavens and a new earth shall appear, wherein dwelleth righteousness.” The Divine mercy having given to the faithful the promise of these astonishing revolutions, and most magnificent events, our hopes of their being fully realized must rest on the infinite wisdom and omnipotence of Jehovah; and, consequently, if our views of these perfections be limited and obscure, our hope in relation to our future destiny will be proportionably feeble and languid; and will scarcely perform its office “as an anchor to the soul, both sure and steadfast.” It is not merely by telling a person that God is All-wise, and All-powerful, that a full conviction of the accomplishment of such grand events will be produced. He must be made to see with his own eyes what the Almighty *has already done*, and what he is now doing in all the regions of universal nature which lie open to our inspection; and this cannot be effected without directing his contemplations to those displays of intelligence and power which are exhibited in the structure, the economy, and the revolutions of the material world.

If the propriety of these sentiments be admitted, it will follow that the more we are accustomed to contemplate the wonders of Divine intelligence and power, in the objects with which we are surrounded, the more deeply shall we be impressed with a conviction, and a confident hope, that all the purposes of divine mercy will ultimately be accomplished in our eternal felicity. It will also follow, that, in proportion as the mind acquires a clear, an extensive, and a reverential view of the essential attributes of the Deity, and of those truths in connection with them, which are objects of contemplation common to all holy beings, in a similar proportion will it be impressed, and its attention arrested, by every other divine subject connected with them. And it is, doubtless, owing to the want of such clear and impressive conceptions of the essential character of Jehovah, and of the first truths of religion, that the bulk of mankind are so little impressed and influenced by the leading doctrines and duties

connected with the plan of the Gospel salvation, and that they entertain so many vague and untenable notions respecting the character and the objects of a superintending Providence. How often, for example, have we witnessed expressions of the foolish and limited notions which are frequently entertained respecting the operations of Omnipotence? When it has been asserted that the earth with all its load of continents and oceans, is in rapid motion through the voids of space—that the sun is ten hundred thousand times larger than the terraqueous globe—and that millions of such globes are dispersed throughout the immensity of nature—some who have viewed themselves as enlightened Christians, have exclaimed at the impossibility of such facts, as if they were beyond the limits of Divine Power, and as if such representations were intended to turn away the mind from God and religion; while, at the same time, they have yielded a firm assent to all the vulgar notions respecting omens, apparitions, and hobgoblins, and to the supposed extraordinary powers of the professors of divination and witchcraft. How can such persons assent, with intelligence and rational conviction, to the dictates of Revelation respecting the energies of Omnipotence which will be exerted at “the consummation of all things,” and in those arrangements which are to succeed the dissolution of our sublunary system? A firm belief in the Almighty Power and unsearchable wisdom of God, as displayed in the constitution and movements of the material world, is of the utmost importance, to confirm our faith, and enliven our hopes, of such grand and interesting events.

Notwithstanding the considerations now stated, which plainly evince the connection of the natural perfections of God with the objects of the Christian Revelation, it appears somewhat strange, that, when certain religious instructors happen to come in contact with this topic, they seem as if they were beginning to tread upon forbidden ground; and, as if it were unsuitable to their office as Christian teachers, to bring forward the stupendous works of the Almighty to illustrate his nature and attributes. Instead of expatiating on the numerous sources of illustration, of which the subject admits, till the minds of their hearers are thoroughly affected with a view of the essential glory of Jehovah—they despatch the subject with two or three vague propositions, which, though logically true, make no impression upon the heart; as if they believed that such contemplations were suited only to carnal men, and mere philosophers; and as if they were afraid, lest the sanctity of the pulpit should be polluted by particular descriptions of those operations of the Deity which are perceived through the medium of the corporeal senses. We do not mean to insinuate, that the essential attributes of God, and the illustrations of them derived from the material world, should

form the sole, or the chief topics of discussion, in the business of religious instruction—but, if the Scriptures frequently direct our attention to these subjects—if they lie at the foundation of all accurate and extensive views of the Christian Revelation—if they be the chief subjects of contemplation to angels, and all other pure intelligences, in every region of the universe—and if they have a tendency to expand the minds of professed Christians, to correct their vague and erroneous conceptions, and to promote their conformity to the moral character of God—we cannot find out the shadow of a reason, why such topics should be almost, if not altogether, overlooked, in the writings and the discourses of those who profess to instruct mankind in the knowledge of God, and the duties of his worship.

We are informed by our Saviour himself, that “this is life eternal, to know thee the living and true God,” as well as “Jesus Christ whom he hath sent.” The knowledge of God, in the sense here intended, must include in it the knowledge of the natural and essential attributes of the Deity, or those properties of his nature by which he is distinguished from all “the idols of the nations.” Such are, his Self-existence, his All-perfect knowledge, his Omnipresence, his Infinite Wisdom, his Boundless Goodness, and Almighty Power—attributes, which, as we have just now seen, lie at the foundation of all the other characters and relations of Deity revealed in the Scriptures. The acquisition of just and comprehensive conceptions of these perfections, must, therefore, lie at the foundation of all profound veneration of the Divine Being, and of all that is valuable in religion. Destitute of such conceptions, we can neither feel that habitual *humility*, and that *reverence* of the majesty of Jehovah, which his essential glory is calculated to inspire, nor pay him that tribute of adoration and gratitude which is due to his name. Devoid of such views, we cannot exercise that cordial acquiescence in the plan of his redemption, in the arrangements of his providence, and in the requirements of his law, which the Scriptures enjoin. Yet, how often do we find persons who pretend to speculate about the mysteries of the Gospel, displaying—by their flippancy of speech respecting the eternal counsels of the Majesty of Heaven—by their dogmatical assertions respecting the Divine character, and the dispensations of providence—and by their pertinacious opinions respecting the laws by which God *must* regulate his own actions—that they have never felt impressive emotions of the grandeur of that Being, whose “operations are unsearchable, and his ways past finding out?” Though they do not call in question his immensity and power, his wisdom and goodness, as so many abstract properties of his nature, yet the unbecoming familiarity with which they approach this august Being, and talk about him, shows that they have

clear conception of those new and interesting relations into which we have been brought by the mediation of Jesus Christ.

If man had continued in his primitive state of integrity, he would have been for ever exercised in tracing the Power, the Beneficence, and other attributes of Deity, in the visible creation alone. Now that his fallen state has rendered additional revelations necessary, in order to secure his happiness—is he completely to throw aside those contemplations and exercises which constituted his chief employment, while he remained a pure moral intelligence? Surely not. One great end of his moral renovation, by means of the Gospel, must be, to enable him *to resume his primitive exercises*, and to qualify him for more enlarged views and contemplations of a similar nature, in that future world, where the physical and moral impediments which now obstruct his progress will be completely removed.

It appears highly unreasonable, and indicates a selfish disposition of mind, to magnify one class of the Divine attributes at the expense of another, to extol, for example, the Mercy of God, and neglect to celebrate his Power and Wisdom—those glorious perfections, the display of which, at the formation of our globe, excited the rapture and admiration of angels, and of innocent man. All the attributes of God are *equal*, because all of them are *infinite*; and, therefore, to talk of *darling* attributes in the Divine Nature, as some have done, is inconsistent with reason, unwarranted by Scripture, and tends to exhibit a distorted view of the Divine character. The Divine mercy ought to be celebrated with rapture by every individual of our fallen race; but with no less rapture should we extol the Divine Omnipotence; for the designs of mercy cannot be accomplished without the intervention of Infinite Power. All that we hope for, in consequence of the promises of God, and of the redemption accomplished by Jesus Christ, must be founded on the conception we form of the operations of Omnipotence. An example or two may not be unnecessary for illustrating this position.

We are warranted, by the sacred oracles, to entertain the hope, that these mortal bodies of ours, after they have mouldered in the dust, been dissolved into their primary elementary parts, and become the prey of devouring reptiles, during a lapse of generations or of centuries,—shall spring forth from the tomb to new life and beauty, and be arrayed in more glorious forms than they now wear; yea, that all the inhabitants of our globe, from Adam to the end of time, though the bodies of thousands of them have been devoured by cannibals, have become the food of fishes and of beasts of prey, and have been burnt to cinders, and their ashes scattered by the winds, over the different regions of sea and land,—shall be reanimated by the voice of the Son of God, and shall appear, each in his proper person and identical

body, before God, the Judge of all. Now, the firmness of our hope of so astonishing an event, which seems to contradict all experience, and appears involved in such a mass of difficulties and apparent contradictions, must be in proportion to the sentiments we entertain of the Divine Intelligence, Wisdom, and Omnipotence. And where are we to find the most striking visible displays of these perfections, except in the actual operations of the Creator, within the range of our view in the material world?

Again, we are informed, in the same Divine records, that, at some future period, the earth on which we now dwell shall be wrapt up in devouring flames, and its present form and constitution for ever destroyed; and its redeemed inhabitants, after being released from the grave, shall be transported to a more glorious region; and that “new heavens and a new earth shall appear, wherein dwelleth righteousness.” The Divine mercy having given to the faithful the promise of these astonishing revolutions, and most magnificent events, our hopes of their being fully realized must rest on the infinite wisdom and omnipotence of Jehovah; and, consequently, if our views of these perfections be limited and obscure, our hope in relation to our future destiny will be proportionably feeble and languid; and will scarcely perform its office “as an anchor to the soul, both sure and steadfast.” It is not merely by telling a person that God is All-wise, and All-powerful, that a full conviction of the accomplishment of such grand events will be produced. He must be made to see with his own eyes what the Almighty *has already done*, and what he is now doing in all the regions of universal nature which lie open to our inspection; and this cannot be effected without directing his contemplations to those displays of intelligence and power which are exhibited in the structure, the economy, and the revolutions of the material world.

If the propriety of these sentiments be admitted, it will follow that the more we are accustomed to contemplate the wonders of Divine intelligence and power, in the objects with which we are surrounded, the more deeply shall we be impressed with a conviction, and a confident hope, that all the purposes of divine mercy will ultimately be accomplished in our eternal felicity. It will also follow, that, in proportion as the mind acquires a clear, an extensive, and a reverential view of the essential attributes of the Deity, and of those truths in connection with them, which are objects of contemplation common to all holy beings, in a similar proportion will it be impressed, and its attention arrested, by every other divine subject connected with them. And it is, doubtless, owing to the want of such clear and impressive conceptions of the essential character of Jehovah, and of the first truths of religion, that the bulk of mankind are so little impressed and influenced by the leading doctrines and duties

connected with the plan of the Gospel salvation, and that they entertain so many vague and untenable notions respecting the character and the objects of a superintending Providence. How often, for example, have we witnessed expressions of the foolish and limited notions which are frequently entertained respecting the operations of Omnipotence? When it has been asserted that the earth with all its load of continents and oceans, is in rapid motion through the voids of space—that the sun is ten hundred thousand times larger than the terraqueous globe—and that millions of such globes are dispersed throughout the immensity of nature—some who have viewed themselves as enlightened Christians, have exclaimed at the impossibility of such facts, as if they were beyond the limits of Divine Power, and as if such representations were intended to turn away the mind from God and religion; while, at the same time, they have yielded a firm assent to all the vulgar notions respecting omens, apparitions, and hobgoblins, and to the supposed extraordinary powers of the professors of divination and witchcraft. How can such persons assent, with intelligence and rational conviction, to the dictates of Revelation respecting the energies of Omnipotence which will be exerted at “the consummation of all things,” and in those arrangements which are to succeed the dissolution of our sublunary system? A firm belief in the Almighty Power and unsearchable wisdom of God, as displayed in the constitution and movements of the material world, is of the utmost importance, to confirm our faith, and enliven our hopes, of such grand and interesting events.

Notwithstanding the considerations now stated, which plainly evince the connection of the natural perfections of God with the objects of the Christian Revelation, it appears somewhat strange, that, when certain religious instructors happen to come in contact with this topic, they seem as if they were beginning to tread upon forbidden ground; and, as if it were unsuitable to their office as Christian teachers, to bring forward the stupendous works of the Almighty to illustrate his nature and attributes. Instead of expatiating on the numerous sources of illustration, of which the subject admits, till the minds of their hearers are thoroughly affected with a view of the essential glory of Jehovah—they despatch the subject with two or three vague propositions, which, though logically true, make no impression upon the heart; as if they believed that such contemplations were suited only to carnal men, and mere philosophers; and as if they were afraid, lest the sanctity of the pulpit should be polluted by particular descriptions of those operations of the Deity which are perceived through the medium of the corporeal senses. We do not mean to insinuate, that the essential attributes of God, and the illustrations of them derived from the material world, should

form the sole, or the chief topics of discussion, in the business of religious instruction—but, if the Scriptures frequently direct our attention to these subjects—if they lie at the foundation of all accurate and extensive views of the Christian Revelation—if they be the chief subjects of contemplation to angels, and all other pure intelligences, in every region of the universe—and if they have a tendency to expand the minds of professed Christians, to correct their vague and erroneous conceptions, and to promote their conformity to the moral character of God—we cannot find out the shadow of a reason, why such topics should be almost, if not altogether, overlooked, in the writings and the discourses of those who profess to instruct mankind in the knowledge of God, and the duties of his worship.

We are informed by our Saviour himself, that “this is life eternal, to know thee the living and true God,” as well as “Jesus Christ whom he hath sent.” The knowledge of God, in the sense here intended, must include in it the knowledge of the natural and essential attributes of the Deity, or those properties of his nature by which he is distinguished from all “the idols of the nations.” Such are, his Self-existence, his All-perfect knowledge, his Omnipresence, his Infinite Wisdom, his Boundless Goodness, and Almighty Power—attributes, which, as we have just now seen, lie at the foundation of all the other characters and relations of Deity revealed in the Scriptures. The acquisition of just and comprehensive conceptions of these perfections, must, therefore, lie at the foundation of all profound veneration of the Divine Being, and of all that is valuable in religion. Destitute of such conceptions, we can neither feel that habitual *humility*, and that *reverence* of the majesty of Jehovah, which his essential glory is calculated to inspire, nor pay him that tribute of adoration and gratitude which is due to his name. Devoid of such views, we cannot exercise that cordial acquiescence in the plan of his redemption, in the arrangements of his providence, and in the requirements of his law, which the Scriptures enjoin. Yet, how often do we find persons who pretend to speculate about the mysteries of the Gospel, displaying—by their flippancy of speech respecting the eternal counsels of the Majesty of Heaven—by their dogmatical assertions respecting the Divine character, and the dispensations of providence—and by their pertinacious opinions respecting the laws by which God *must* regulate his own actions—that they have never felt impressive emotions of the grandeur of that Being, whose “operations are unsearchable, and his ways past finding out?” Though they do not call in question his immensity and power, his wisdom and goodness, as so many abstract properties of his nature, yet the unbecoming familiarity with which they approach this august Being, and talk about him, shows that they have

never associated in their minds, the stupendous displays which have been given of these perfections, in the works of his hands; and that their religion (if it may be so called) consists merely in a farrago of abstract opinions, or in an empty name.

If, then, it be admitted, that it is essentially requisite, as the foundation of religion, to have the mind deeply impressed with a clear and comprehensive view of the natural perfections of the Deity, it will follow, that the ministers of religion, and all others whose province it is to communicate religious instruction, ought frequently to dwell, with particularity, on those proofs and illustrations which tend to convey the most definite and impressive conceptions of the glory of that Being whom we profess to adore. But from what sources are such illustrations to be derived? Is it from abstract reasonings and metaphysical distinctions and definitions, or from a survey of those objects and movements which lie open to the inspection of every observer? There can be no difficulty in coming to a decision on this point. We might affirm, with the schoolmen, that "God is a Being whose centre is every where, and his circumference no where;" that "he comprehends infinite duration in every moment;" and that "infinite space may be considered as the sensorium of the Godhead;" but such fanciful illustrations, when strictly analyzed, will be found to consist merely of words without ideas. We might also affirm with truth, that God is a Being of infinite perfection, glory, and blessedness—that he is without all bounds or limits either actual or possible—that he is possessed of power sufficient to perform all things which do not imply a contradiction—that he is independent and self-sufficient—that his wisdom is unerring, and that he infinitely exceeds all other beings. But these, and other expressions of a similar kind, are mere technical terms, which convey no adequate, nor even tolerable, notion of what they import. Beings, constituted like man, whose rational spirits are connected with an organical structure, and who derive all their knowledge through the medium of corporeal organs, can derive their clearest and most affecting notions of the Divinity, chiefly through the same medium, namely, by contemplating the effects of his perfections, as displayed through the ample range of the visible creation. And to this source of illustration, the inspired writers uniformly direct our views—"Lift up your eyes on high, and behold! who hath created these orbs? who bringeth forth their host by number, and calleth them all by their names? The everlasting God, the Lord, by the greatness of his might, for that he is strong in power."—"He hath made the earth by his power; he hath established the world by his wisdom; he hath stretched out the heavens by his understanding." These writers do not perplex our minds by a mul-

titude of technical terms and subtle reasonings but lead us directly to the source whence our most ample conceptions of Deity are to be derived, that, from a steady and enlightened contemplation of the effects, we may learn the greatness of the Cause; and their example, in this respect, ought, doubtless, to be a pattern for every religious instructor.

---

## SECTION II.

### *Illustrations of the Omnipotence of the Deity.*

IN order to elucidate more distinctly what has been now stated, I shall select a few illustrations of some of the natural attributes of the Deity. And, in the first place, I shall offer a few considerations which have a tendency to direct and to amplify our conceptions of Divine Power.

Omnipotence is that attribute of the Divine Being, by which he can accomplish every thing that does not imply a contradiction—however far it may transcend the comprehension of finite minds. By his power the vast system of universal nature was called from nothing into existence, and is continually supported, in all its movements, from age to age. In elucidating this perfection of God, we might derive some striking illustrations from the records of his dispensations towards man, in the early ages of the world—when he overwhelmed the earth with the deluge, which covered the tops of the highest mountains, and swept the crowded population of the ancient world into a watery grave—when he demolished Sodom and Gomorrah, and the cities around them, with fire from heaven—when he slew all the first-born of Egypt, and turned their rivers into blood—when he divided the Red Sea and the waters of Jordan before the tribes of Israel—when he made the earth to open its jaws and swallow up Korah and all his company—and when he caused Mount Sinai to smoke and tremble at his presence. But these and similar events, however awful, astonishing, and worthy of remembrance, were only transitory exertions of Divine Power, and are not calculated, and were never intended, to impress the mind in so powerful a manner as those displays of Omnipotence which are exhibited in the ordinary movements of the material universe. We have no hesitation in asserting, that, with regard to this attribute of the Divinity, there is a more grand and impressive display in the works of Nature, than in all the events recorded in the Sacred History. Nor ought this remark to be considered as throwing the least reflection on the fulness and sufficiency of the Scripture revelation; for that revelation, as having a special reference to a moral economy, has for its object to give a more particular display of the moral than of the natural per-

fections of God. The miracles to which we have now referred, and every other supernatural fact recorded in the Bible, were not intended so much to display the *plenitude* of the power of Deity, as to bear testimony to the Divine mission of particular messengers, and to confirm the truths they declared. It was not, for example, merely to display the energies of Almighty power, that the waters of the Red Sea were dried up before the thousands of Israel, but to give a solemn and striking attestation to all concerned, that the Most High God had taken this people under his peculiar protection—that he had appointed Moses as their leader and legislator—and that they were bound to receive and obey the statutes he delivered. The most appropriate and impressive illustrations of Omnipotence, are those which are taken from the *permanent* operations of Deity, which are visible every moment in the universe around us; or, in other words, those which are derived from a detail of the facts which have been observed in the material world, respecting *magnitude* and *motion*.

In the first place *the immense quantity of matter* contained in the universe, presents a most striking display of Almighty power.

In endeavouring to form a definite notion on this subject, the mind is bewildered in its conceptions, and is at a loss where to begin or to end its excursions. In order to form something approximating to a well-defined idea, we must pursue a train of thought commencing with those magnitudes which the mind can easily grasp, proceeding through all the intermediate gradations of magnitude, and fixing the attention on every portion of the chain, till we arrive at the object or magnitude of which we wish to form a conception. We must endeavour, in the first place, to form a conception of the bulk of the world in which we dwell, which, though only a point in comparison of the whole material universe, is in reality a most astonishing magnitude, which the mind cannot grasp, without a laborious effort. We can form some definite idea of those protuberate masses we denominate *hills*, which arise above the surface of our plains; but were we transported to the mountainous scenery of Switzerland, to the stupendous range of the Andes in South America, or to the Himalayan mountains in India, where masses of earth and rocks, in every variety of shape, extend several hundreds of miles in different directions, and rear their projecting summits beyond the region of the clouds—we should find some difficulty in forming an adequate conception of the objects of our contemplation. For, (to use the words of one who had been a spectator of such scenes,) “Amidst those trackless regions of intense silence and solitude, we cannot contemplate, but with feelings of awe and admiration, the enormous masses of variegated matter which lie around, beneath, and above us. The mind la-

bours, as it were, to form a definite idea of those objects of oppressive grandeur, and feels unable to grasp the august objects which compose the surrounding scene.” But what are all these mountainous masses, however variegated and sublime, when compared with the bulk of the whole earth? Were they hurled from their bases, and precipitated into the vast Pacific Ocean, they would all disappear in a moment, except perhaps a few projecting tops, which, like a number of small islands, might be seen rising a few fathoms above the surface of the waters.

The earth is a globe whose diameter is nearly 8,000 miles, and its circumference about 25,000, and, consequently, its surface contains nearly two hundred millions of square miles—a magnitude too great for the mind to take in at *one* conception. In order to form a tolerable conception of the whole, we must endeavour to take a leisurely survey of its different parts. Were we to take our station on the top of a mountain, of a moderate size, and survey the surrounding landscape, we should perceive an extent of view stretching 40 miles in every direction, forming a circle 80 miles in diameter, and 250 in circumference and comprehending an area of 5,000 square miles. In such a situation the terrestrial scene around and beneath us—consisting of hills and plains, towns and villages, rivers and lakes—would form one of the largest objects which the eye, and even the imagination, can steadily grasp at one time. But such an object, grand and extensive as it is, forms no more than the *forty-thousandth part* of the terraqueous globe; so that before we can acquire an adequate conception of the magnitude of our own world, we must conceive 40,000 landscapes of a similar extent, to pass in review before us: and were a scene, of the magnitude now stated, to pass before us every hour, till all the diversified scenery of the earth were brought under our view, and were 12 hours a day allotted for the observation, it would require 9 years and 48 days before the whole surface of the globe could be contemplated, even in this *general* and *rapid* manner. But, such a variety of successive landscapes passing before the eye, even although it were possible to be realized, would convey only a very vague and imperfect conception of the scenery of our world; for objects at the distance of 40 miles cannot be distinctly perceived; the only view which would be satisfactory would be, that which is comprehended within the range of 3 or 4 miles from the spectator.

Again, I have already stated, that the surface of the earth contains nearly 200,000,000 of square miles. Now, were a person to set out on a minute survey of the terraqueous globe, and to travel till he passed along every square mile on its surface, and to continue his route without intermission, at the rate of 30 miles every day, it would require 18,264 years before he could finish his tour, and

complete the survey of "this huge rotundity on which we tread:" so that, had he commenced his excursion on the day in which Adam was created, and continued it to the present hour, he would not have accomplished one third part of this vast tour.

In estimating the size and extent of the earth, we ought also to take into consideration the vast variety of objects with which it is diversified, and the numerous animated beings with which it is stored; the great divisions of land and water, the continents, seas, and islands into which it is distributed; the lofty ranges of mountains which rear their heads to the clouds; the unfathomed abysses of the ocean; its vast subterraneous caverns and burning mountains; and the lakes, rivers, and stately forests with which it is so magnificently adorned;—the many millions of animals, of every size and form, from the elephant to the mite, which traverse its surface; the numerous tribes of fishes, from the enormous whale to the diminutive shrimp, which "play" in the mighty ocean; the aerial tribes which sport in the regions above us, and the vast mass of the surrounding atmosphere, which encloses the earth and all its inhabitants as "with a swaddling band." The immense variety of beings with which our terrestrial habitation is furnished, conspires with every other consideration, to exalt our conceptions to that power by which our globe, and all that it contains, were brought into existence.

The preceding illustrations, however, exhibit the vast extent of the earth, considered only as a mere superficies. But we know that the earth is a solid globe, whose specific gravity is nearly five times denser than water, or about twice as dense as the mass of earth and rocks which compose its surface. Though we cannot dig into its bowels beyond a mile in perpendicular depth, to explore its hidden wonders, yet we may easily conceive what a vast and indescribable mass of matter must be contained between the two opposite portions of its external circumference, reaching 8000 miles in every direction. The solid contents of this ponderous ball is no less than 263,858,149,120 cubical miles—a mass of material substance of which we can form but a very faint and imperfect conception—in proportion to which all the lofty mountains which rise above its surface are less than a few grains of sand, when compared with the largest artificial globe. Were the earth a hollow sphere surrounded merely with an external shell of earth and water, 10 miles thick, its internal cavity would be sufficient to contain a quantity of materials *one hundred and thirty-three times* greater than the whole mass of continents, islands and oceans, on its surface, and the foundations on which they are supported. We have the strongest reasons, however, to conclude, that the earth, in its general structure, is one solid mass, from the surface to the centre, excepting, perhaps, a few caverns scattered here

and there amidst its subterraneous recesses: and that its density gradually increases from its surface to its central regions. What an enormous mass of materials, then, is comprehended within the limits of the globe on which we tread! The mind labours, as it were, to comprehend the mighty idea, and after all its exertion, feels itself unable to take in such an astonishing magnitude at one comprehensive grasp. How great must be the power of that Being who commanded it to spring from nothing into existence, who "measurcth the ocean in the hollow of his hand, who weigheth the mountains in scales, and hangeth the earth upon nothing!"

It is essentially requisite, before proceeding to the survey of objects and magnitudes of a superior order, that we should endeavour, by such a train of thought as the preceding, to form some tolerable and clear conception of the bulk of the globe we inhabit; for it is the only body we can use as a standard of comparison to guide the mind in its conceptions, when it roams abroad to other regions of material existence. And, from what has been now stated, it appears, that we have no *adequate* conception of a magnitude of so vast an extent; or, at least, that the mind cannot, in any one instant, form to itself a distinct and comprehensive idea of it, in any measure corresponding to the reality.

Hitherto, then, we have fixed only on a determinate magnitude—on a scale of a few inches, as it were, in order to assist us in our measurement and conception of magnitudes still more august and astonishing. When we contemplate, by the light of science, those magnificent globes which float around us, in the concave of the sky, the earth with all its sublime scenery, stupendous as it is, dwindles into an inconsiderable ball. If we pass from our globe to some of the other bodies of the planetary system, we shall find that one of these stupendous orbs is more than 900 times the size of our world, and encircled with a ring 200,000 miles in diameter, which would nearly reach from the earth to the moon, and would enclose within its vast circumference several hundreds of worlds as large as ours. Another of these planetary bodies, which appears to the vulgar eye only as a brilliant speck on the vault of heaven, is found to be of such a size, that it would require 1,400 globes of the bulk of the earth to form one equal to it in dimensions. The whole of the bodies which compose the solar system, (without taking the sun and the comets into account,) contain a mass of matter 2,500 times greater than that of the earth. The sun himself is 520 times larger than all the planetary globes taken together; and one million three hundred thousand times larger than the terraqueous globe. This is one of the most glorious and magnificent visible objects, which either the eye or the imagination can contemplate; especially when we

consider, what perpetual and incomprehensible and powerful influence he exerts, what warmth and beauty and activity he diffuses, not only on the globe we inhabit, but over the more extensive regions of surrounding worlds. His energy extends to the utmost limits of the planetary system—to the planet Herschel, which revolves at the distance of 1,800 millions of miles from his surface, and there he dispenses light, and colour, and comfort, to all the beings connected with that far-distant orb, and to all the moons which roll around it.

Here the imagination begins to be overpowered and bewildered in its conceptions of magnitude, when it has advanced scarcely a single step in its excursions through the material world: For it is highly probable that all the matter contained within the limits of the solar system, incomprehensible as its magnitude appears, bears a smaller proportion to the whole mass of the material universe, than a single grain of sand to all the particles of matter contained in the body of the sun and his attending planets.

If we extend our views from the solar system to the starry heavens, we have to penetrate, in our imagination, a space which the swiftest ball that was ever projected, though in perpetual motion, would not traverse in ten hundred thousand years. In those trackless regions of immensity, we behold an assemblage of resplendent globes, similar to the sun in size and in glory, and, doubtless, accompanied with a retinue of worlds, revolving, like our own, around their attractive influence. The immense distance at which the nearest stars are known to be placed, proves that they are bodies of a prodigious size, not inferior to our sun, and that they shine, not by reflected rays, but by their own native light. But bodies encircled with such refulgent splendour would be of little use in the economy of Jehovah's empire, unless surrounding worlds were cheered by their benign influence, and enlightened by their beams. Every star is, therefore, with good reason, concluded to be a sun, no less spacious than ours, surrounded by a host of planetary globes, which revolve around it as a centre, and derive from it light, and heat, and comfort. Nearly a thousand of these 'luminaries may be seen in a clear winter night, by the naked eye; so that a mass of matter equal to a thousand solar systems, or to *thirteen hundred and twenty millions of globes of the size of the earth*, may be perceived, by every common observer, in the canopy of heaven. But all the celestial orbs which are perceived by the unassisted sight, do not form the eighty-thousandth part of those which may be descried by the help of optical instruments. The telescope has enabled us to descry, in certain spaces of the heavens, thousands of stars where the naked eye could scarcely discern twenty. The late celebrated astronomer, Dr. Herschel, has in-

formed us, that, in the most crowded parts of the Milky-way, when exploring that region with his best glasses, he has had fields of view which contained no less than 588 stars, and these were continued for many minutes: so that "in one quarter of an hour's time there passed no less than *one hundred and sixteen thousand stars* through the field of view of his telescope."

It has been computed, that nearly *one hundred millions* of stars might be perceived by the most perfect instruments, were all the regions of the sky thoroughly explored. And yet, all this vast assemblage of suns and worlds, when compared with what lies beyond the utmost boundaries of human vision, in the immeasurable spaces of creation, may be no more than as the smallest particle of vapour to the immense ocean. Immeasurable regions of space lie beyond the utmost limits of mortal view, into which even imagination itself can scarcely penetrate, and which are, doubtless, replenished with the operations of Divine Wisdom and Omnipotence. For, it cannot be supposed, that a being so diminutive as man, whose stature scarcely exceeds six feet—who vanishes from the sight at the distance of a league—whose whole habitation is invisible from the nearest star—whose powers of vision are so imperfect, and whose mental faculties are so limited—it cannot be supposed that man, who "dwells in tabernacles of clay, who is crushed before the moth," and chained down, by the force of gravitation, to the surface of a small planet,—should be able to descry the utmost boundaries of the empire of Him who fills immensity, and dwells in "light unapproachable." That portion of his dominions, however, which lies within the range of our view, presents such a scene of magnificence and grandeur, as must fill the mind of every reflecting person with astonishment and reverence, and constrain him to exclaim, "Great is our Lord, and of great power, his understanding is infinite."—"When I consider the heavens, the work of thy fingers, the moon and the stars which thou hast ordained—what is man that thou art mindful of him?"—"I have heard of thee by hearing of the ear; I have listened to subtle disquisitions on thy character and perfections, and have been but little affected, "but now thine eye seeth thee; wherefore I humble myself, and repent in dust and ashes."

In order to feel the full force of the impression made by such contemplations, the mind must pause at every step, in its excursions through the boundless regions of material existence: for it is not by a mere attention to the figures and numbers by which the magnitudes of the great bodies of the universe are expressed, that we arrive at the most distinct and ample conceptions of objects so grand and overwhelming. The mind, in its intellectual range, must dwell on every individual scene it contemplates, and on the various objects of which it is composed.

It must add scene to scene, magnitude to magnitude, and compare smaller objects with greater—a range of mountains with the whole earth, the earth with the planet Jupiter, Jupiter with the sun, the sun with a thousand stars, a thousand stars with 80 millions, and 80 millions with all the boundless extent which lies beyond the limits of mortal vision; and, at every step of this mental process, sufficient time must be allowed for the imagination to expatiate on the objects before it, till the ideas approximate, as near as possible, to the reality. In order to form a comprehensive conception of the extent of the terraqueous globe, the mind must dwell on an extensive landscape, and the objects with which it is adorned; it must endeavour to survey the many thousands of diversified landscapes which the earth exhibits—the hills and plains, the lakes and rivers and mountains, which stretch in endless variety over its surface—it must dive into the vast caverns of the ocean—penetrate into the subterraneous regions of the globe, and wing its way amidst clouds and tempests, through the surrounding atmosphere. It must next extend its flight through the most expansive regions of the solar system, realizing, in imagination, those magnificent scenes which can be described neither by the naked eye nor by the telescope, and comparing the extent of our sublunary world with the more magnificent globes that roll around us. Leaving the sun and all his attendant planets behind, till they have diminished to the size of a small twinkling star, it must next wing its way to the starry regions, and pass from one system of worlds to another, from one Nebulæ\* to another, from one region of Nebulæ to another, till it arrive at the utmost boundaries of creation which human genius has explored. It must also endeavour to extend its flight beyond all that is visible by the best telescopes, and expatiate at large in that boundless expanse into which no human eye has yet penetrated, and which is, doubtless, replenished with other worlds, and systems, and firmaments, where the operations of infinite power and beneficence are displayed in endless variety, throughout the illimitable regions of space.

Here, then, with reverence, let us pause, and wonder! Over all this vast assemblage of material existence, God presides. Amidst the diversified objects and intelligences it contains, he is eternally and essentially present. By his unerring wisdom, all its complicated movements are directed. By his Almighty fiat, it emerged from nothing into existence, and is continually supported from age to age. “HE SPAKE AND IT WAS DONE; HE COMMANDED AND IT STOOD FAST.”—“By the word of the Lord were the

heavens made, and all the host of them by the spirit of his mouth.” What an astonishing display of Divine power is here exhibited to our view! How far transcending all finite comprehension must be the energies of Him who only “spake and it was done;” who only gave the command, and this mighty system of the universe, with all its magnificence, started into being! The infinite ease with which this vast fabric was reared, leads us irresistibly to conclude, that there are powers and energies in the Divine mind which have never yet been exerted, and which may unfold themselves to intelligent beings, in the production of still more astonishing and magnificent effects, during an endless succession of existence. That man who is not impressed with a venerable and overwhelming sense of the power and majesty of Jehovah, by such contemplations, must have a mind incapable of ardent religious emotions, and unqualified for appreciating the grandeur of that Being “whose kingdom ruleth over all.” And shall such ennobling views be completely withheld from a Christian audience? Shall it be considered as a matter of mere indifference, whether their views of the Creator’s works be limited to the sphere of a few miles around them, or extended to ten thousand worlds?—whether they shall be left to view the operations of the Almighty throughout eternity past and to come, as confined to a small globe placed in the immensity of space, with a number of brilliant studs fixed in the arch of heaven, at a few miles distance; or as extending through the boundless dimensions of space?—whether they shall be left to entertain no higher idea of the Divine majesty than what may be due to one of the superior orders of the seraphim or cherubim,—or whether they shall be directed to form the most august conceptions of the King eternal, immortal, and invisible, corresponding to the displays he has given of his glory in his visible works? If it be not, both reason and piety require, that such illustrations of the Divine perfections should occasionally be exhibited to their view.

In the next place, the *rapid motions* of the great bodies of the universe, no less than their magnitudes, display the Infinite Power of the Creator.

We can acquire accurate ideas of the relative velocities of moving bodies, only by comparing the motions with which we are familiar, with one another, and with those which lie beyond the general range of our minute inspection. We can acquire a pretty accurate conception of the velocity of a ship impelled by the wind—of a steamboat—of a race-horse—of a bird darting through the air—of an arrow flying from a bow—and of the clouds when impelled by a stormy wind. The velocity of a ship is from 8 to 12 miles an hour—of a race-horse, from 20 to 30 miles—of a bird, say from 50 to 60 miles, and of the clouds, in a violent hurricane, from 80 to 100 miles an hour. The motion of a ball from a

\* For an account of the Nebulæ, see Ch. II. Art. *Astronomy*.

loaded cannon is incomparably swifter than any of the motions now stated; but of the velocity of such a body we have a less accurate idea; because, its rapidity being so great, we cannot trace it distinctly by the eye through its whole range, from the mouth of the cannon to the object against which it is impelled. By experiments, it has been found, that its rate of motion is from 480 to 800 miles in an hour, but it is retarded every moment, by the resistance of the air and the attraction of the earth. This velocity, however, great as it is, bears no sensible proportion to the rate of motion which is found among the celestial orbs. That such enormous masses of matter should move at all, is wonderful; but when we consider the amazing velocity with which they are impelled, we are lost in astonishment. The planet Jupiter, in describing his circuit round the sun, moves at the rate of 29,000 miles an hour. The planet Venus, one of the nearest and most brilliant of the celestial bodies, and about the same size as the earth, is found to move through the spaces of the firmament at the rate of 76,000 miles an hour, and the planet Mercury with a velocity of no less than 150,000 miles an hour, or 1750 miles in a minute—a motion two hundred times swifter than that of a cannon ball.

These velocities will appear still more astonishing, if we consider the magnitude of the bodies which are thus impelled, and the immense forces which are requisite to carry them along in their courses. However rapidly a ball flies from the mouth of a cannon, it is the flight of a body only a *few inches* in diameter; but one of the bodies, whose motion has been just now stated, is *eighty-nine thousand miles* in diameter, and would comprehend, within its vast circumference, more than a thousand globes as large as the earth. Could we contemplate such motions, from a fixed point, at the distance of only a few hundreds of miles from the bodies thus impelled—it would raise our admiration to its highest pitch, it would overwhelm all our faculties, and, in our present state, would produce an impression of awe, and even of terror, beyond the power of language to express. The earth contains a mass of matter equal in weight to at least 2,200,000,000,000,000,000 tons, supposing its mean density to be only about  $2\frac{1}{2}$  times greater than water. To move this ponderous mass a single inch beyond its position, were it fixed in a quiescent state, would require a mechanical force almost beyond the power of numbers to express. The physical force of all the myriads of intelligences within the bounds of the planetary system, though their powers were far superior to those of men, would be altogether inadequate to the production of such a motion. How much more must be the force requisite to impel it with a velocity one hundred and forty times swifter than a cannon ball, or

68,000 miles an hour, the actual rate of its motion, in its course round the sun! But whatever degree of mechanical power would be requisite to produce such a stupendous effect, it would require a force one hundred and fifty times greater to impel the planet Jupiter, in his actual course through the heavens! Even the planet Saturn, one of the slowest moving bodies of our system, a globe 900 times larger than the earth, is impelled through the regions of space at the rate of 22,000 miles an hour, carrying along with him two stupendous rings, and seven moons larger than ours, through his whole course round the central luminary. Were we placed within a thousand miles of this stupendous globe, (a station which superior beings may occasionally occupy,) where its hemisphere, encompassed by its magnificent rings, would fill the whole extent of our vision—the view of such a ponderous and glorious object, flying with such amazing velocity before us, would infinitely exceed every idea of grandeur we can derive from terrestrial scenes, and overwhelm our powers with astonishment and awe. Under such an emotion, we could only exclaim, “**GREAT AND MARVELLOUS ARE THY WORKS, LORD GOD ALMIGHTY!**” The ideas of *strength* and *power* implied in the impulsion of such enormous masses of matter through the illimitable tracts of space, are forced upon the mind with irresistible energy, far surpassing what any abstract propositions or reasonings can convey; and constrain us to exclaim, “Who is a strong Lord like unto thee! Thy right hand is become glorious in power! the Lord God omnipotent reigneth!”

If we consider the *immense number* of bodies thus impelled through the vast spaces of the universe—the rapidity with which the *comets*, when near the sun, are carried through the regions they traverse,—if we consider the high probability, if not absolute certainty, that the sun, with all his attendant planets and comets, is impelled with a still greater degree of velocity towards some distant region of space, or around some wide circumference—that all the thousands of systems of that nebulae to which the sun belongs, are moving in a similar manner—that all the nebulae in the heavens are moving around some magnificent central body—in short, that all the suns and worlds in the universe are in rapid and perpetual motion, as constituent portions of one grand and boundless empire, of which Jehovah is the Sovereign—and, if we consider still further, that all these mighty movements have been going on, without intermission, during the course of many centuries, and some of them, perhaps, for myriads of ages before the foundations of our world were laid—it is impossible for the human mind to form any adequate idea of the stupendous forces which are in incessant operation throughout the unlimited empire of the Almighty. To estimate such mechanical force even in a single instance,

completely baffles the mathematician's skill, and sets the power of numbers at defiance. "Language," and figures, and comparisons, are "lost in wonders so sublime," and the mind, overpowered with such reflections, is irresistibly led upwards, to search for the cause in that OMNIPOTENT BEING who upholds the pillars of the universe—the thunder of whose power none can comprehend. While contemplating such august objects, how emphatic and impressive appears the language of the sacred oracles, "Canst thou by searching find out God? Canst thou find out the Almighty to perfection? Great things doth he, which we cannot comprehend. Thine, O Lord, is the greatness, and the glory, and the majesty; for all that is in heaven and earth is thine. Among the gods there is none like unto thee, O Lord, neither are there any works like unto thy works. Thou art great, and dost wondrous things; thou art God alone. Hast thou not known, hast thou not heard, that the everlasting God, the Lord, the Creator of all things, fainteth not, neither is weary? there is no searching of his understanding. Let all the earth fear the Lord, let all the inhabitants of the world stand in awe of him; for, he spake, and it was done; he commanded, and it stood fast."

Again, the immense spaces which surround the heavenly bodies, and in which they perform their revolutions, tend to expand our conceptions on this subject, and to illustrate the magnificence of the Divine operations. In whatever point of view we contemplate the scenery of the heavens, an idea of grandeur irresistibly bursts upon the mind; and, if empty space can, in any sense, be considered as an object of sublimity, nothing can fill the mind with a grander idea of magnitude and extension, than the amplitude of the scale on which planetary systems are constructed. Around the body of the sun there is allotted a cubical space, 3,600 millions of miles in diameter, in which eleven planetary globes revolve—every one being separated from another, by intervals of many millions of miles. The space which surrounds the utmost limits of our system, extending in every direction, to the nearest fixed stars, is, at least, 40,000,000,000,000 miles in diameter; and, it is highly probable, that every star is surrounded by a space of equal, or even of greater extent. A body impelled with the greatest velocity which art can produce, a cannon ball, for instance would require twenty years to pass through the space that intervenes between the earth and the sun, and four millions, seven hundred thousand years, ere it could reach the nearest star. Though the stars seem to be crowded together in clusters, and some of them almost to touch one another, yet the distance between any two stars which seem to make the nearest approach, is such as neither words can express, nor imagination fathom. These immense spaces are as unfathomable on the one

hand, as the magnitude of the bodies which move in them, and their prodigious velocities, are incomprehensible on the other; and they form a part of those magnificent proportions according to which the fabric of universal nature was arranged—all corresponding to the majesty of that infinite and incomprehensible Being, "who measures the ocean in the hollow of his hand, and meteth out the heavens with a span." How wonderful that bodies at such prodigious distances should exert a mutual influence on one another! that the moon at the distance of 240,000 miles should raise tides in the ocean, and currents in the atmosphere! that the sun, at the distance of ninety-five millions of miles, should raise the vapours, move the ocean, direct the course of the winds, fructify the earth, and distribute light, and heat, and colour, through every region of the globe; yea, that his attractive influence, and fructifying energy, should extend even to the planet Herschel, at the distance of eighteen hundred millions of miles! So that, in every point of view in which the universe is contemplated, we perceive the same grand scale of operation by which the Almighty has arranged the provinces of his universal kingdom.

We would now ask, in the name of all that is sacred, whether such magnificent manifestations of Deity ought to be considered as irrelevant in the business of religion, and whether they ought to be thrown completely into the shade, in the discussions which take place in religious topics, in "the assemblies of the saints?" If religion consists in the intellectual apprehension of the perfections of God, and in the moral effects produced by such an apprehension—if all the rays of glory emitted by the luminaries of heaven, are only so many reflections of the grandeur of Him who dwells in light unapproachable—if they have a tendency to assist the mind in forming its conceptions of that ineffable Being, whose uncreated glory cannot be directly contemplated—and if they are calculated to produce a sublime and awful impression on all created intelligences,—shall we rest contented with a less glorious idea of God than his works are calculated to afford? Shall we disregard the works of the Lord, and condemn "the operations of his hands," and that, too, in the face of all the invitations on this subject, addressed to us from heaven? For thus saith Jehovah: "Lift up your eyes on high, and behold, who hath created these things, who bringeth forth their host by number. I, the Lord, who maketh all things, who stretcheth forth the heavens alone, and spread abroad the earth by himself; all their host have I commanded." And, if, at the command of God, we lift up our eyes to the "firmament of his power," surely we ought to do it, not with a brute, unconscious gaze," not with the vacant stare of a savage, not as if we were still enveloped with the mists and prejudices of the dark ages—but as surrounded by that blaze

of light which modern science has thrown upon the scenery of the sky, in order that we may contemplate, with fixed attention, all that enlightened reason, aided by the nicest observations, has ascertained respecting the magnificence of the celestial orbs. To overlook the sublime discoveries of modern times, to despise them, or to call in question their reality, as some religionists have done, because they bring to our ears such astonishing reports of the "eternal power" and majesty of Jehovah—is to act as if we were afraid lest the Deity should be represented as more grand and magnificent than he really is, and as if we would be better pleased to pay him a less share of homage and adoration than is due to his name.

Perhaps some may be disposed to insinuate, that the views now stated are above the level of ordinary comprehension, and founded too much on scientific considerations, to be stated in detail to a common audience. To any insinuations of this kind, it may be replied, that such illustrations as those to which we have referred, are more easily comprehended than many of those abstract discussions to which they are frequently accustomed; since they are definite and tangible, being derived from those objects which strike the senses and the imagination. Any person of common understanding may be made to comprehend the leading ideas of extended space, magnitude, and motion, which have been stated above, provided the descriptions be sufficiently simple, clear, and well-defined; and should they be at a loss to comprehend the principles on which the conclusions rest, or the mode by which the magnificence of the works of God has been ascertained, an occasional reference to such topics would excite them to inquiry and investigation, and to the exercise of their powers of observation and reasoning on such subjects—which are too frequently directed to far less important objects. The following illustration, however, stands clear of every objection of this kind, and is level to the comprehension of every man of common sense: Either the earth moves round its axis once in twenty-four hours—or, the sun, moon, planets, comets, stars, and the whole frame of the universe move round the earth, in the same time. There is no alternative, or third opinion, that can be formed on this point. If the earth revolve on its axis every 24 hours, to produce the alternate succession of day and night, the portions of its surface about the equator must move at a rate of more than a thousand miles an hour, since the earth is more than twenty-four thousand miles in circumference. This view of the fact, when attentively considered, furnishes a most sublime and astonishing idea. That a globe of so vast dimensions, with all its load of mountains, continents, and oceans, comprising within its circumference a mass of two hundred and sixty-four thousand million of cubical miles, should whirl around with so amazing

velocity, gives us a most august and impressive conception of the greatness of that Power which first set it in motion, and continues the rapid whirl from age to age! Though the huge masses of the Alpine mountains were in a moment detached from their foundations, carried aloft through the regions of the air, and tossed into the Mediterranean sea, it would convey no idea of a force equal to that which is every moment exerted, if the earth revolve on its axis. But should the motion of our earth be called in question, or denied, the idea of force, or power, will be indefinitely increased. For, in this case, it must necessarily be admitted, that the heavens, with all the innumerable host of stars, have a diurnal motion around the globe; which motion must be inconceivably more rapid than that of the earth, on the supposition of its motion. For, in proportion as the celestial bodies are distant from the earth, in the same proportion would be the rapidity of their movements. The sun, on this supposition, would move at the rate of 414,000 miles in a minute; the nearest stars, at the rate of fourteen hundred millions of miles in a second: and the most distant luminaries, with a degree of swiftness which no numbers could express.\* Such velocities, too, would be the rate of motion, not merely of a single globe like the earth, but of all the ten thousand times ten thousand spacious globes that exist within the boundaries of creation. This view conveys an idea of power still more august and overwhelming than any of the views already stated, and we dare not presume to assert, that such a degree of physical force is beyond the limits of infinite perfection; but on the supposition it existed, it would confound all our ideas of the wisdom and intelligence of the Divine mind, and would appear altogether inconsistent with the character which the scripture gives us of the Deity as "the only wise God." For, it would exhibit a stupendous system of means altogether disproportioned to the end intended—namely, to produce the alternate succession of day and night to the inhabitants of our globe, which is more beautifully and harmoniously effected by a simple rotation on its axis, as is the case with the other globes which compose the planetary system. Such considerations, however, show us, that, on whatever hypothesis, whether on the vulgar or the scientific, or in whatever other point of view, the frame of nature may be contemplated, the mind is irresistibly impressed with ideas of power, grandeur, and magnificence. And, therefore, when an inquiring mind is directed to contemplate the works of God, on any hypothesis it may choose, it has a tendency to rouse reflection, and to stimulate the exercise of the moral and intellectual faculties, on objects which are worthy of the dignity of immortal minds.

\* See Appendix, No. 1.

We may now be, in some measure, prepared to decide, whether illustrations of the omnipotence of the Deity, derived from the system of the material world, or those vague and metaphysical disquisitions which are generally given in theological systems, be most calculated to impress the mind, and to inspire it with reverence and adoration. The following is a description, given of this attribute of God, by a well-known systematic writer, who has generally been considered as a judicious and orthodox divine:—

"God is almighty, Rev. i. 18, chap. iv. 8. This will evidently appear, in that, if he be infinite in all his other perfections, he must be so in power: thus, if he be omniscient, he knows what is possible or expedient to be done; and if he be an infinite sovereign, he wills whatever shall come to pass. Now this knowledge would be insignificant, and his power inefficacious, were he not infinite in power, or almighty. Again, this might be argued from his justice, either in rewarding or punishing: for if he were not infinite in power, he could do neither of these, at least so far as to render him the object of that desire or fear, which is agreeable to the nature of these perfections; neither could infinite faithfulness accomplish all the promises which he hath made, so as to excite that trust and dependence which is a part of religious worship; nor could he say without limitation, as he does, *I have spoken it, I will also bring it to pass; I have purposed it, I will also do it*; Isa. xlv. 11. But since power is visible in, and demonstrated by its effect, and infinite power by those effects which cannot be produced by a creature, we may observe the almighty power of God in all his works, both of nature and grace: thus his eternal power is understood, as the apostle says, *By the things that are made*, Rom. i. 20, not that there was an eternal production of things, but the exerting this power in time proves it to be infinite and truly divine; for no creature can produce the smallest particle of matter out of nothing, much less furnish the various species of creatures with those endowments in which they excel one another, and set forth their Creator's glory. And the glory of his power is no less visible in the works of providence, whereby he upholds all things, disposes of them according to his pleasure, and brings about events which only he who has an almighty arm can effect."—*Ridgley's Body of Divinity*, p. 39.

This is the whole that Dr. Ridgley judges it necessary to state, in illustration of the attribute of Omnipotence, except what he says in relation to its operation "in the work of grace," in "the propagation and success of the Gospel," &c. subjects, to which the idea of power, or physical energy, does not properly apply. Such, however, are the meager and abstract disquisitions generally given by most systematic writers. There is a continual play on the term "infinite," which

to most minds conveys no idea at all, unless it be associated with ample conceptions of motion, magnitude, and extension; and it is constantly applied to subjects to which it was never intended to apply, such as "infinite faithfulness, infinite justice, infinite truth," &c. an application of the term which is never sanctioned by Scripture, and which has a tendency to introduce confusion into our conceptions of the perfections of God. Granting that the statements and reasonings in such an extract as the above were unquestionable, yet what impression can they make upon the mind? Would an ignorant person feel his conceptions of the Divinity much enlarged, or his moral powers aroused, by such vague and general statements? And, if not, it appears somewhat unaccountable, that those sources of illustration, which would convey the most ample and definite views of the "eternal power" and glory of God, should be studiously concealed from the view. Vague descriptions and general views of any object will never be effectual in awakening the attention, and arresting the faculties of the mind. The heart will always remain unimpressed, and the understanding will never be thoroughly excited in its exercise, unless the intellect have presented before it a well-defined and interesting object, and be enabled to survey it in its various aspects; and this object must always have a relation to the material world, whether it be viewed in connexion with religion, or with any other subject.

Thus I have endeavoured, in the preceding sketches, to present a few detached illustrations of the omnipotence and grandeur of the Deity, as displayed in the vast magnitude of the material universe—the stupendous velocities of the celestial bodies—and in the immeasurable regions of space which surround them, and in which their motions are performed. Such a magnificent spectacle as the fabric of the universe presents—so majestic, God-like, and overwhelming, to beings who dwell "in tabernacles of clay"—was surely never intended to be overlooked, or to be gazed at with indifference, by creatures endowed with reason and intelligence, and destined to an immortal existence. In forming a universe composed of so many immense systems and worlds, and replenished with such a variety of sensitive and intelligent existences, the Creator doubtless intended that it should make a sublime and reverential impression on the minds of all the intellectual beings to whom it might be displayed, and that it should convey some palpable idea of the infinite glories of his nature, in so far as material objects can be supposed to adumbrate the perfections of a spiritual and uncreated Essence. Dwelling in "light inaccessible" to mortals, and forever veiled from the highest created being, the pure spirituality and immensity of his nature

There is no conceivable mode by which the infinite grandeur of Deity could be exhibited to finite intelligences, but through the medium of those magnificent operations which are incessantly going forward throughout the boundless regions of space. Concealed from the gaze of all the "principalities and powers" in heaven, in the unfathomable depths of his Essence, he displays his presence in the universe he has created, and the glory of his power, by launching magnificent worlds into existence, by adorning them with diversified splendours, by peopling them with various ranks of intelligent existence, and by impelling them in their movements through the illimitable tracts of creation.

It will readily be admitted by every enlightened Christian, that it must be a highly desirable attainment, to acquire the most glorious idea of the Divine Being which the limited capacity of our minds is capable of receiving. This is one of the grand difficulties in religion. The idea of a Being purely IMMATERIAL, yet pervading infinite space, and possessed of no sensible qualities, confounds and bewilders the human intellect, so that its conceptions, on the one hand, are apt to verge towards extravagancy, while, on the other, they are apt to degenerate into something approaching to inanity. Mere abstract ideas and reasonings respecting infinity, eternity, and absolute perfection, however sublime we may conceive them to be, completely fail in arresting the understanding, and affecting the heart; our conceptions become vague, empty, and confused, for want of a material vehicle to give them order, stability, and expansion. Something of the nature of vast extension, of splendid and variegated objects, and of mighty movements, is absolutely necessary, in order to convey to spirits dwelling in bodies of clay, a definite conception of the invisible glories of the Eternal Mind; and, therefore, in the immense variety of material existence with which the universe is adorned, we find every requisite assistance of this kind to direct and expand our views of the great object of our adoration. When the mind is perplexed and overwhelmed with its conceptions, when it labours, as it were, to form some well-defined conceptions of an Infinite Being, it here finds some tangible objects on which to fix, some sensible substratum for its thoughts to rest upon for a little, while it attempts to penetrate, in its excursions, into those distant regions which eye hath not seen, and to connect the whole of its mental survey with the energies of the "King, Eternal, Immortal, and Invisible."

To such a train of thought we are uniformly directed in the sacred oracles, where Jehovah is represented as describing himself by the effects which his power and wisdom have produced. "Israel shall be saved in the Lord with an everlasting salvation. For thus saith Jehovah that created the heavens; God himself that formed the earth and made it; he hath established it, he

created it not in vain, he formed it to be inhabited; I am the Lord, and there is none else."—"I have made the earth and created man upon it, my hands have stretched out the heavens, and all their host have I commanded."—"Hearken unto me, O Israel: I am the first, I also am the last. Mine hand also hath laid the foundation of the earth, and my right hand hath spanned the heavens: when I call unto them, they stand up together."—"Who hath measured the waters in the hollow of his hand, and meted out heaven with the span, and weighed the mountains in scales? He who sitteth upon the circle of the earth, and the inhabitants thereof are as grasshoppers; that stretched out the heavens as a curtain, that faineth not, neither is weary."—"The Lord made the heavens, the heaven of heavens, with all their hosts; honour and majesty are before him, and his kingdom ruleth over all."\* Such sublime descriptions of Jehovah, and references to his material works, are reiterated in every portion of the sacred volume; and the import and sublimity of such expressions cannot be fully appreciated, unless we take into view all the magnificent objects which science has unveiled in the distant regions of creation.

This subject is calculated not merely to overpower the intellect with ideas of sublimity and grandeur, but also to produce a deep moral impression upon the heart; and a Christian philosopher would be deficient in his duty, were he to overlook this tendency of the objects of his contemplation.

One important moral effect which this subject has a natural tendency to produce, is, profound HUMILITY. What an insignificant being does man appear, when he compares himself with the magnificence of creation, and with the myriads of exalted intelligences with which it is peopled! What are all the honours and splendours of this earthly ball, of which mortals are so proud, when placed in competition with the resplendent glories of the skies? Such a display as the Almighty has given of himself, in the magnitude and variety of his works, was evidently intended "to stain the pride" of all human grandeur, that "no flesh should glory in his presence." Yet, there is no disposition that appears so prominent among puny mortals, as pride, ambition, and vainglory—the very opposite of humility, and of all those tempers which become those "who dwell in tabernacles of clay, and whose foundation is in the dust." Even without taking into account the state of man as a *depraved* intelligence, what is there in his situation that should inspire him with "lofty looks," and induce him to look down on his fellow-men with supercilious contempt? He derived his origin from the dust, he is allied with the beasts that perish, and he is fast hastening to the grave, where his carcass

\* Isa. xlv. 18, 19. xlviii. 12, 13. xl. 12, 22, &c.

will become the food for noisome reptiles. He is every moment dependent on a Superior Being for every pulse that beats, and every breath he draws, and for all that he possesses; he is dependent even on the meanest of his species for his accommodations and comforts. He holds every enjoyment on the most precarious tenure,—his friends may be snatched in a moment from his embrace; his riches may take to themselves wings and fly away; and his health and beauty may be blasted in an hour, by a breath of wind. Hunger and thirst, cold and heat, poverty and disgrace, sorrow and disappointment, pain and disease, mingle themselves with all his pursuits and enjoyments. His knowledge is circumscribed within the narrowest limits, his errors and follies are glaring and innumerable; and he stands as an almost undistinguishable atom, amidst the immensity of God's works. Still, with all these powerful inducements to the exercise of humility, man dares to be proud and arrogant.

—————"Man, proud Man,  
Dressed in a little brief authority,  
Plays such fantastic tricks before high Heaven,  
As make the angels weep."

How affecting to contemplate the warrior, flushed with diabolical pride, pursuing his conquests through heaps of slain, in order to obtain possession of "a poor pitiable speck of perishing earth;" exclaiming in his rage, "I will pursue, I will overtake, I will divide the spoil, my lust shall be satisfied upon them, I will draw my sword, my hand shall destroy them"—to behold the man of rank glorying in his wealth, and his empty titles, and looking around upon the inferior orders of his fellow-mortals as the worms of the dust—to behold the man of ambition pushing his way through bribery, and treachery, and slaughter, to gain possession of a throne, that he may look down with proud pre-eminence upon his fellows—to behold the haughty airs of the noble dame, inflated with the idea of her beauty, and her high birth, as she struts along, surveying the ignoble crowd as if they were the dust beneath her feet—to behold the smatterer in learning, puffed up with a vain conceit of his superficial acquirements, when he has scarcely entered the porch of knowledge—in fine, to behold all ranks, from the highest to the lowest, big with an idea of their own importance, and fired with pride and revenge at the least provocation, whether imaginary or real! How inconsistent the manifestations of such tempers, with the many humiliating circumstances of our present condition, and with the low rank which we hold in the scale of Universal Being?

It is not improbable, that there are in the universe intelligences of a superior order, in whose breasts pride never found a place—to whom this globe of ours, and all its inhabitants, appear as inconsiderable as a drop of water filled

with microscopic animalcule, does to the proud lords of this earthly region. There is at least one Being to whom this sentiment is applicable, in its utmost extent:—"Before HIM all nations are as a drop of a bucket, and the inhabitants of the earth as grasshoppers; yea, they are as nothing, and are counted to him less than nothing, and vanity." Could we wing our way, with the swiftness of a seraph, from sun to sun, and from world to world, till we had surveyed all the systems visible to the naked eye, which are only as a mere speck in the map of the universe—could we, at the same time, contemplate the glorious landscapes and scenes of grandeur they exhibit—could we also mingle with the pure and exalted intelligences which people those resplendent abodes, and behold their humble and ardent adorations of their Almighty Maker, their benign and condescending deportment towards one another; "each esteeming another better than himself," and all united in the bonds of the purest affection, without one haughty or discordant feeling—what indignation and astonishment would seize us, on our return to this obscure corner of creation, to behold beings enveloped in the mist of ignorance, immersed in depravity and wickedness, liable to a thousand accidents, exposed to the ravages of the earthquake, the volcano and the storm; yet proud as Lucifer, and glorying in their shame! We should be apt to view them, as we now do those bedlamites, who fancy themselves to be kings, surrounded by their nobles, while they are chained to the walls of a noisome dungeon. "Sure pride was never made for man." How abhorrent, then, must it appear in the eyes of superior beings, who have taken an expansive range through the field of creation? How abhorrent it is in the sight of the Almighty, and how amiable is the opposite virtue, we learn from his word:—"Every one that is proud in heart is an abomination to the Lord."—"God resisteth the proud, but giveth grace to the humble."—"Thus saith the High and Lofty One who inhabiteth eternity, I dwell in the high and holy place; with him also that is of an humble and contrite spirit; to revive the spirit of the humble, and the heart of the contrite ones."—While, therefore, we contemplate the omnipotence of God, in the immensity of creation, let us learn to cultivate humility and self-abasement. This was one of the lessons which the pious Psalmist deduced from his survey of the nocturnal heavens. When he beheld the moon walking in the brightness, and the innumerable host of stars, overpowered with a sense of his own insignificance, and the greatness of divine condescension, he exclaimed, "O Lord! what is man, that thou art mindful of him, or the son of man, that thou shouldest visit him!"

Again, this subject is also calculated to inspire us with REVERENCE and VENERATION of God. Profound veneration of the Divine Being lies at

the foundation of all religious worship and obedience. But, in order to venerate God aright, we must know him; and, in order to acquire the true knowledge of him, we must contemplate him through the medium of those works and dispensations, by which he displays the glories of his nature to the inhabitants of our world. I have already exhibited a few specimens of the stupendous operations of his power, in that portion of the system of the universe which lies open to our inspection; and there is surely no mind in which the least spark of piety exists, but must feel strong emotions of reverence and awe, at the thought of that Almighty and Incomprehensible Being, who impels the huge masses of the planetary globes with so amazing a rapidity through the sky, and who has diversified the voids of space with so vast an assemblage of magnificent worlds. Even those manifestations of Deity which are confined to the globe we inhabit, when attentively considered, are calculated to rouse even the unthinking mind, to astonishment and awe. The lofty mountains, and expansive plains, the mass of water in the mighty ocean, the thunders rolling along the sky, the lightnings flashing from cloud to cloud, the hurricane and the tempest, the volcano vomiting rivers of fire, and the earthquake shaking kingdoms, and levelling cities with the ground—all proclaim the Majesty of Him, by whom the elements of nature are arranged and directed, and seem to address the sons of men in language like this: “The Lord reigneth, he is clothed with majesty; at his wrath the earth trembles; a fire goeth before him, and burneth up his enemies.”—“Let all the earth fear the Lord, let all the inhabitants of the world stand in awe of him.”

There is one reason, among others, why the bulk of mankind feel so little veneration of God, and that is, that they seldom contemplate, with fixed attention, “the operations of his hands.” If we wish to cherish this sublime sentiment in our hearts, we must familiarize our minds to frequent excursions over all those scenes of Creation and Providence, which the volume of nature, and the volume of inspiration unfold to view. We must endeavour to assist our conceptions of the grandeur of these objects, by every discovery which has been or may yet be made, and by every mode of illustration by which a sublime and comprehensive idea of the particular object of contemplation may be obtained. If we would wish to acquire some definite, though imperfect, conception of the physical extent of the universe, our minds might be assisted by such illustrations as the following:—Light flies from the sun with a velocity of nearly two hundred thousand miles in a moment of time, or, about 1,400,000 times swifter than the motion of a cannon ball: Suppose that one of the highest order of intelligences is endowed with a power of rapid motion superior to that of light, and with a corresponding

degree of intellectual energy; that he has been flying without intermission, from one province of creation to another, for six thousand years, and will continue the same rapid course for a thousand millions of years to come; it is highly probable, if not absolutely certain, that, at the end of this vast tour, he would have advanced no further than “the suburbs of creation”—and that all the magnificent systems of material and intellectual beings he had surveyed, during his rapid flight, and for such a length of ages, bear no more proportion to the whole Empire of Omnipotence, than the smallest grain of sand does to all the particles of matter of the same size contained in ten thousand worlds. Nor need we entertain the least fear, that the idea of the extent of the Creator’s power, conveyed by such a representation, exceeds the bounds of reality. On the other hand, it must fall almost infinitely short of it. For, as the poet has justly observed—

“Can man conceive beyond what God can do?”

Were a seraph, in prosecuting the tour of creation in the manner now stated, ever to arrive at a limit beyond which no farther displays of the Divinity could be perceived, the thought would overwhelm his faculties with unutterable anguish and horror: he would feel, that he had now, in some measure, comprehended all the plans and operations of Omnipotence, and that no farther manifestation of the Divine glory remained to be explored. But we may rest assured, that this can never happen in the case of any created intelligence. We have every reason to believe, both from the nature of an Infinite Being, and from the vast extent of creation already explored, that the immense mass of material existence, and the endless variety of sensitive and intellectual beings with which the universe is replenished, are intended by Jehovah to present to his rational offspring a *shadow*, an *emblem*, or a *representation*, (in so far as finite extended existence can be a representation,) of the *Infinite Perfections* of his nature, which would otherwise have remained for ever impalpable to all subordinate intelligence.

In this manner, then, might we occasionally exercise our minds on the grand and diversified objects which the universe exhibits; and in proportion as we enlarge the sphere of our contemplations, in a similar proportion will our views of God himself be extended, and a corresponding sentiment of veneration impressed upon the mind. For the soul of man cannot venerate a mere abstract being, that was never manifested through a sensible medium, however many lofty terms may be used to describe his perfections. It venerates that Ineffable Being, who conceals himself behind the scenes of Creation, through the medium of the visible displays he exhibits of his Power, Wisdom, and Beneficence, in the Economy of Nature, and in the Records of Revelation. Before the universe was formed Jehovah existed alone, possessed of every attri-

but which he now displays. But, had only one solitary intelligence been created, and placed in the infinite void, without a material substratum beneath and around him, he could never have been animated with a sentiment of profound veneration for his Creator; because no objects existed to excite it, or to show that his Invisible Maker was invested with those attributes which he is now known to possess. Accordingly, we find, in the sacred writings, that, when a sentiment of reverence is demanded from the sons of men, those sensible objects which are calculated to excite the emotion, are uniformly exhibited. "Fear ye not me? saith the Lord. Will ye not tremble at my presence? who have placed the sand for the bound of the sea, by a perpetual decree, that it cannot pass it; and though the waves thereof toss themselves, yet they cannot prevail; though they roar, yet can they not pass over it." "Who would not fear thee, O King of nations? Thou art the true God, and an everlasting King. Thou hast made the earth by thy power, thou hast established the world by thy wisdom, thou hast stretched out the heavens by thy discretion. When thou utterest thy voice, there is a noise of waters in the heavens, thou causest the vapours to ascend from the ends of the earth, thou makest lightnings with rain, and bringest forth the winds out of thy treasures."\*

But, however enlarged and venerable conceptions of God we may derive from the manifestations of his power, they must fall infinitely short of what is due to a being of boundless perfection. For there may be attributes in the Divine Essence, of which we cannot possibly form the least conception—attributes which cannot be shadowed forth or represented by any portion of the material or intellectual world yet discovered by us, or by all the mighty achievements by which human redemption was effected—attributes which have not been yet displayed, in their effects, to the highest orders of intelligent existence. And, therefore, as that excellent philosopher and divine, the honourable Mr. Boyle, has well observed—"Our ideas of God, however so great, will rather express the greatness of our veneration, than the Immensity of his perfections; and the notions worthy of the most intelligent men are far short of being worthy the incomprehensible God—the brightest idea we can frame of God being infinitely inferior, and no more than a *Parhellen*† in respect of the sun; for though that meteor is splendid, and resembles the sun, yet it resides in a cloud, and is not only much beneath the sun in distance, but inferior in bigness and splendour."

\* Jerem. x. 7—13.

† A *Parhellen* or *Mock-Sun*, is a meteor in the form of a very bright light, appearing on one side of the sun, and somewhat resembling the appearance of that luminary. This phenomenon is supposed to be produced by the refraction and reflection of the sun's rays from a watery cloud. Sometimes three or four of these parhelia, all of them bearing a certain resemblance to the real sun, have been seen at one time.

In short, were we habitually to cherish that profound veneration of God which his works are calculated to inspire, with what humility would we approach the presence of this august Being! with what emotions of awe would we present our adorations! and with what reverence would we talk of his inscrutable purposes, and incomprehensible operations! We would not talk about him, as some writers have done, with the same ease and indifference, as a mathematician would talk about the properties of a triangle, or a philosopher about the effects of a mechanical engine; nor would we treat, with a spirit of levity, any of the solemn declarations of his word, or the mighty movements of his providence. We would be ever ready to join with ardour in the sublime devotions of the inspired writers, "Great and marvellous are thy works, Lord God Almighty, just and true are thy ways, thou King of saints. Who would not fear thee, O Lord, and glorify thy name? Let all the earth fear the Lord, let all the inhabitants of the world stand in awe of him."

Lastly, the views we have taken of the omnipotence and grandeur of the Deity are calculated to inspire us with HOPE and CONFIDENCE in the prospect of that eternal existence which lies before us. The period of our existence in this terrestrial scene will soon terminate, and those bodies through which we now hold a correspondence with the visible creation, be crumbled into dust. The gradual decay, and the ultimate dissolution of human bodies, present a scene at which reason stands aghast; and, on a cursory survey of the chambers of the dead, it is apt to exclaim, in the language of despair, "Can these dry bones live?" A thousand difficulties crowd upon the mind, which appear repugnant to the idea that "beauty shall again spring out of the ashes, and life out of the dust." But, when we look abroad to the displays of Divine power and intelligence, in the wide expanse of Creation, we perceive that

—"Almighty God  
Has done much more; nor is his arm impaired  
Through length of days. And what he can, he will  
His faithfulness stands bound to see it done."

We perceive that he has created systems in such vast profusion, that no man can number them. The worlds every moment under his superintendence and direction, are unquestionably far more numerous than all the human beings who have hitherto existed, or will yet exist till the close of time. And, if he has not only arranged the general features of each of these worlds, and established the physical laws, by which its economy is regulated, but has also arranged the diversified circumstances, and directs the minutest movements of the myriads of sensitive and intellectual existences it contains, we ought never for a moment to doubt, that the minutest particles of every human body, however widely separated from each other and mingled with other

extraneous substances, are known to him whose presence pervades all space; and that all the atoms requisite for the construction of the Resurrection body will be reassembled for this purpose "by the energy of that mighty power, whereby he is able to subdue all things to himself." If we suppose that a number of human beings, amounting to three hundred thousand millions, shall start from the grave into new life, at the general resurrection, and that the atoms of each of these bodies are just now under the special superintendence of the Almighty—and that at least an equal number of worlds are under his particular care and direction—the exertion of power and intelligence, in the former case, cannot be supposed to be greater than what is requisite in the latter. To a Being possessed of infinite Power, conjoined with boundless Intelligence, the superintendence of countless atoms, and of countless worlds, is equally easy, where no contradiction is implied. For as the poet has well observed,—

"He summons into being, with like ease,  
A whole creation, and a single grain."

And since this subject tends to strengthen our hope of a resurrection from the dead, it is also calculated to inspire us with confidence in the prospect of those eternal scenes which will burst upon the view, at the dissolution of all terrestrial things. Beyond the period fixed for the conflagration of this world, "a wide and unbounded prospect lies before us;" and though, at present, "shadows, clouds, and darkness rest upon it," yet the boundless magnificence of the Divine empire which science has unfolded, throws a radiance over the scenes of futurity, which is fraught with consolation in the view of "the wreck of matter and the crush of worlds." It opens to us a prospect of perpetual improvement in knowledge and felicity; it presents a field in which the human faculties may be for ever expanding, for ever contemplating new scenes of grandeur rising to the view, in boundless perspective, through an interminable succession of existence. It convinces us that the happiness of the eternal state will not consist in an unvaried repetition of the same perceptions and enjoyments, but that new displays of the Creator's glory will be continually bursting on the astonished mind, world without end. And as we know the same beneficence and care which are displayed in the arrangement of systems of worlds, are also displayed in supporting and providing for the smallest microscopic animalcule, we have no reason to harbour the least fear, lest we should be overlooked in the immensity of creation, or lost amidst the multiplicity of those works among which the Deity is incessantly employed; for, as he is Omnipresent and Omniscient, his care and influence must extend to every creature he has formed. Therefore, though "the elements shall melt with fervent heat, and the earth, and all the works there-

in be dissolved, yet we, according to his promise, look for new heavens and a new earth, wherein dwelleth righteousness."

### SECTION III.

#### *On the Wisdom and Intelligence of the Deity.*

IN surveying the system of nature with a Christian and a Philosophic eye, it may be considered in different points of view. It may be viewed either as displaying the power and magnificence of the Deity in the immense quantity of materials of which it is composed, and in the august machinery and movements by which its economy is directed;—or, as manifesting his Wisdom in the nice adaptation of every minute circumstance to the end it was intended to accomplish;—or as illustrating his unbounded beneficence in the provision which is made for the accommodation and happiness of the numerous tribes of sentient and intelligent beings it contains. Having, in the preceding section, endeavored to exhibit some of those objects which evince the Omnipotence of Deity, and the pious emotions they are calculated to excite, I shall now offer a few popular illustrations of Divine Wisdom, as displayed in the arrangements of the material world—which shall chiefly be confined to those objects which are most prominent and obvious to the vulgar eye.

*Wisdom* is that perfection of an intelligent agent, by which he is enabled to select and employ the most proper means in order to accomplish a good and important end. It includes the idea of knowledge or intelligence, but may be distinguished from it. Knowledge is opposed to ignorance, wisdom is opposed to folly or error in conduct. As applied to God, it may be considered as comprehending the operations of his Omniscience and benevolence, or, in other words, his knowledge to discern, and his disposition to choose those means and ends which are calculated to promote the order and the happiness of the universe.

The Wisdom of God is, doubtless, displayed in every arrangement he has made throughout all the provinces of his immense and eternal kingdom, however far they may be removed from the sphere of human observation. But it is only in those parts of the system of nature which lie open to our particular investigation, that the traces of this perfection can be distinctly perceived. The *Heavens* declare the glory of God's Wisdom, as well as of his Power. The planetary system—that portion of the heavens with which we are best acquainted—displays both the magnificence and the skill of its Divine Author, in the magnitudes, distances, revolutions, proportions, and uses of the various globes of which it is composed, and in

the diversified apparatus by which light and darkness are alternately distributed. The sun, an immense luminous world, by far the largest body in the system, is placed in the centre. No other position would have suited for an equable distribution of illumination and heat through the different parts of the system. Around him, at different distances, eleven primary planets revolve, accompanied with eighteen secondaries, or moons, —all in majestic order and harmony, no one interrupting the movements of another, but invariably keeping the paths proscribed them, and performing their revolutions in their appointed times. To all these revolving globes, the sun dispenses motion, light, heat, fertility, and other unceasing energies, for the comfort and happiness of their respective inhabitants—without which, perpetual sterility, eternal winter, and eternal night, would reign over every region of our globe, and throughout surrounding worlds.

The distance at which the heavenly bodies, particularly the sun, are placed from the earth, is a manifest evidence of Divine Wisdom. If the sun were much nearer us than he is at present, the earth, as now constituted, would be wasted and parched with excessive heat; the waters would be turned into vapour, and the rivers, seas, and oceans, would soon disappear, leaving nothing behind them but frightful barren dells and gloomy caverns; vegetation would completely cease, and the tribes of animated nature languish and die. On the other hand, were the sun much farther distant than he now is, or were his bulk, or the influence of his rays, diminished one half of what they now are, the land and the ocean would soon become one frozen mass, and universal desolation and sterility would overspread the fair face of nature, and, instead of a pleasant and comfortable abode, our globe would become a frightful desert, a state of misery and perpetual punishment.\* But herein is the wisdom of God displayed, that he has formed the sun of such a determinate size, and placed it at such a convenient distance, as not to annoy, but to refresh and cheer us, and to enliven the soil with its genial influence; so that we plainly perceive, to use the language of the prophet, that "He hath established the world by his wisdom, and stretched out the heavens by his understanding."

\* It forms no objection to these remarks, that caloric, or the matter of heat, does not altogether depend upon the direct influence of the solar rays. The substance of caloric may be chiefly connected with the constitution of the globe we inhabit. But still, it is quite certain that the earth, as *presently constituted*, would suffer effects most disastrous to sentient beings, were it removed much nearer to, or much farther from the central luminary. Those planets which are removed several hundreds of millions of miles farther from the sun than our globe, may possibly experience a degree of heat much greater than ours; but, in this case, the constitution of the solid parts of these globes, and of their surrounding atmospheres, must be very different from what obtains in the physical arrangements of our globe.

The rotation of the several planetary globes around their axis, to produce the alternate succession of day and night, strikingly demonstrates the wisdom and benevolence of their great Author. Were the earth and the other planetary worlds destitute of a diurnal motion, only one half of their surfaces could be inhabited, and the other half would remain a dark and cheerless desert. The sun would be the only heavenly orb which would be recognized by the inhabitants of each respective world, as existing in the universe; and that scene of grandeur which night unfolds in the boundless expanse of the sky, would be for ever veiled from their view. For, it appears to be one grand design of the Creator, in giving these bodies a diurnal motion, not only to cheer their inhabitants with light and warmth, and the gay colouring produced by the solar rays, but also to open to them a prospect of other portions of his vast dominions, which are dispersed in endless variety throughout the illimitable regions of space; in order that they may acquire a more sublime impression of the glory of his kingdom, and of his eternal Power and Godhead. But, were perpetual day to irradiate the planets, it would throw an eternal and impenetrable veil over the glories of the sky, behind which, the magnificent operations of Jehovah's power would be, in a great measure, concealed. It is this circumstance which we should consider as the principal reason why a rotatory motion has been impressed on the planetary globes; and not merely that a curtain of darkness might be thrown around their inhabitants, during the repose of sleep, as in the world in which we dwell. For in some of the other planetary worlds belonging to our system, the intelligent beings with which they are peopled may stand in no need of that nocturnal repose which is necessary for man; their physical powers may be incapable of being impaired, and their mental energies may be in perpetual exercise. And in some of those bodies which are surrounded with an assemblage of rings and moons, as the planet Saturn, the diversified grandeur of their celestial phenomena, in the absence of the sun, may present a scene of contemnation and enjoyment, far more interesting than all the splendours of their noon-day. Besides, had the planets no motion round their axis, and were both their hemispheres supposed to be peopled with inhabitants, their physical state and enjoyments would be as opposite to each other, as if they lived under the government of two distinct independent beings. While the one class was basking under the splendours of perpetual day, the other would be involved in all the horrors of an everlasting night. While the one hemisphere would be parched with excessive heat, the other would be bound in the fetters of eternal ice; and, in such a globe as ours, the motion of the tides, the ascent of the vapours, the currents of the atmosphere, the course of the winds, the

benign influences of the rains and dews, and a thousand other movements which produce so many salutary and beneficial effects, would be completely deranged. Hence we find that in all the planetary bodies on which observations can conveniently be made, a rotatory motion actually exists, in the secondary, as well as in the primary planets, and even in the sun himself, the centre, and the mover of the whole: in which arrangement of the Almighty Creator, the evidences of wisdom and design are strikingly apparent.

This amazing scene of Divine workmanship and skill, which the planetary system exhibits, we have reason to believe, is multiplied, and diversified, to an indefinite extent, throughout all the other systems of creation, displaying to the intelligences of every region, "the manifold wisdom of God." For there can be no question, that every star we now behold, either by the naked eye, or by the help of a telescope, is the centre of a system of planetary worlds, where the agency of God, and his unsearchable wisdom, may be endlessly varied, and, perhaps, more strikingly displayed than even in the system to which we belong. These vast globes of light could never have been designed merely to shed a few glimmering rays on our far-distant world; for the ten-thousandth part of them has never yet been seen by the inhabitants of the earth, since the Mosaic creation, except by a few astronomers of the past and the present age; and the light of many of them, in all probability, has never yet reached us; and perhaps never will, till the period of "the consummation of all terrestrial things." They were not made in vain; for such a supposition would be inconsistent with every idea we can form of the attributes of a Being of infinite perfection. They were not intended merely to diversify the voids of infinite space with a useless splendour, which has no relation to intellectual natures; for this would give us a most distorted and inconsistent idea of the character of Him who is "the only-wise God;" and we are told, by an authority which cannot be questioned, that "by his wisdom he made the heavens, and stretched them out by his understanding." The only rational conclusion, therefore, which can be deduced, is that they are destined to distribute illumination and splendour, vivifying influence, and happiness, among incalculable numbers of intelligent beings, of various degrees of physical, moral, and intellectual excellence. And, wherever the Creator has exerted his Almighty energies in the production of sensitive and intellectual natures, we may rest assured, that there also his infinite wisdom and intelligence, in an endless variety of arrangements, contrivances, and adaptations, are unceasingly displayed.

But, after all, whatever evidences of contrivance and design the celestial globes may exhibit, it is not in the heavens that the most striking displays of Divine wisdom can be traced

by the inhabitants of our world. It is only a few general relations and adaptations that can be distinctly perceived among the orbs of the firmament; though, in so far as we are able to trace the purposes which they subserve, the marks of beauty, order, and design are uniformly apparent. But we are placed at too great a distance from the orbs of heaven, to be able to investigate the particular arrangements which enter into the physical and moral economy of the celestial worlds. Were we transported to the surface of the planet Jupiter, and had an opportunity of surveying, at leisure, the regions of that vast globe, and the tribes of sensitive and intellectual existence which compose its population—of contemplating the relations of its moons to the pleasure and comfort of its inhabitants—the constitution of its atmosphere as to its reflective and refractive powers, in producing a degree of illumination to compensate for the great distance of that planet from the sun—its adaptation to the functions of animal life—the construction of the visual organs of its inhabitants, and the degree of sensibility they possess corresponding to the quantity of light received from the sun—the temperature of the surface and atmosphere of this globe corresponding to its distance from the central source of heat, and to the physical constitution of sensitive beings—in short, could we investigate the relations which inanimate nature, in all its varieties and sublimities, bears to the necessities and the happiness of the animated existences that traverse its different regions, we should, doubtless, behold a scene of Divine Wisdom and intelligence, far more admirable and astonishing than even that which is exhibited in our sublunary world. But since it is impossible for us to investigate the economy of other worlds, while we are chained down to this terrestrial sphere, we must direct our attention to those arrangements and contrivances in the constitution of our own globe, which lie open to our particular inspection, in order to perceive more distinctly the benevolent designs of Him "in whom we live and move, and have our being." And here an attentive observer will find, in almost every object, when minutely examined, a display of goodness and intelligence, which will constrain him to exclaim, "Oh the depth of the riches both of the wisdom and the knowledge of God."

Wisdom, considered as consisting in contrivance, or the selection of the most proper means in order to accomplish an important end, may be exemplified and illustrated in a variety of familiar objects in the scene of nature.

The earth on which we tread was evidently intended by the Creator to support man and other animals, along with their habitations, and to furnish those vegetable productions which are necessary for their subsistence; and, accordingly, he has given it that exact degree of consistency

which is requisite for these purposes. Were it much harder than it now is ; were it, for example, as dense as a rock, it would be incapable of cultivation, and vegetables could not be produced from its surface. Were it softer, it would be insufficient to support us, and we should sink at every step, like a person walking in a quagmire. Had this circumstance not been attended to in its formation, the earth would have been rendered useless as a habitable world, for all those animated beings which now traverse its surface. The exact adjustment of the solid parts of our globe to the nature and necessities of the beings which inhabit it, is, therefore, an instance and an evidence of *Wisdom*.

The *diversity of surface* which it every where presents, in the mountains and vales with which it is variegated, indicates the same benevolent contrivance and design. If the earth were divested of its mountains, and its surface every where uniformly smooth, there would be no rivers, springs, or fountains ; for water can flow only from a higher to a lower place ; the vegetable tribes would droop and languish ; man and other animals would be deprived of what is necessary for their existence and comfort ; we should be destitute of many useful stones, minerals, plants, and trees, which are now produced on the surface, and in the interior of mountains ; the sea itself would become a stagnant marsh, or overflow the land ; and the whole surface of nature in our terrestrial sphere would present an unvaried scene of dull uniformity. Those picturesque and sublime scenes which fire the imagination of the poet, and which render mountainous districts so pleasing to the philosophic traveller, would be completely withdrawn ; and all around, when compared with such diversified landscapes, would appear as fatiguing to the eye as the vast solitudes of the Arabian deserts, or the dull monotony of the ocean. But in consequence of the admirable distribution of hills and mountains over the surface of our globe, a variety of useful and ornamental effects is produced. Their lofty summits are destined by providence to arrest the vapours which float in the regions of the air ; their internal cavities form so many spacious basins for the reception of waters distilled from the clouds ; they are the original sources of springs and rivers, which water and fertilize the earth ; they form immense magazines, in which are deposited stones, metals, and minerals, which are of so essential service in the arts that promote the comfort of human life ; they serve for the production of a vast variety of herbs and trees ; they arrest the progress of storms and tempests ; they afford shelter and entertainment to various animals which minister to the wants of mankind : in a word, they adorn and embellish the face of nature—they form thousands of sublime and beautiful landscapes, and afford from their summits the most delightful prospects of the plains below.

All these circumstances demonstrate the consummate wisdom of the Great Architect of nature, and lead us to conclude, that mountains, so far from being rude excrescences of nature, as some have asserted, form an essential part in the constitution, not only of our globe, but of all habitable worlds. And this conclusion is confirmed, so far as our observation extends, with regard to the moon, and several of the planetary bodies which belong to our system, whose surfaces are found to be diversified by sublime ramifications of mountain scenery ; which circumstance forms one collateral proof, among many others, that they are the abodes of sentient and intellectual beings.

Again, the *colouring* which is spread over the face of nature indicates the wisdom of the Deity. It is essential to the present mode of our existence, and it was evidently intended by the Creator, that we should be enabled easily to recognize the forms and properties of the various objects with which we are surrounded. But were the objects of nature destitute of colour, or were the same unvaried hue spread over the face of creation, we should be destitute of all the entertainments of vision, and be at a loss to distinguish one object from another. We should be unable to distinguish rugged precipices from fruitful hills ; naked rocks from human habitations ; the trees from the hills that bear them, and the tilled from the untilled lands. " We should hesitate to pronounce whether an adjacent enclosure contained a piece of pasturage, a plot of arable land, or a field of corn ; and it would require a little journey, and a minute investigation, to determine such a point. We could not determine whether the first person we met were a soldier in his regimentals, or a swain in his Sunday suit ; a bride in her ornaments, or a widow in her weeds." Such would have been the aspect of nature, and such the inconveniences to which we should have been subjected, had God allowed us light, without the distinction of colours. We could have distinguished objects only by intricate trains of reasoning, and by circumstances of time, place, and relative position. And, to what delays and perplexities should we have been reduced, had we been obliged every moment to distinguish one thing from another by reasoning ! Our whole life must then have been employed rather in study than in action ; and, after all, we must have remained in eternal uncertainty as to many things which are now quite obvious to every one as soon as he opens his eyes. We could neither have communicated our thoughts by writing, nor have derived instruction from others through the medium of books : so that we should now have been almost as ignorant of the transactions of past ages, as we are of the events which are passing in the planetary worlds ; and, consequently, we could never have enjoyed a written revelation from heaven, nor any other infallible

guide to direct us in the path to happiness, is the Almighty had not distinguished the rays of light, and painted the objects around us with a diversity of colours,—as essentially connected are the minutest, and the most magnificent works of Deity. But now, in the present constitution of things, colour characterizes the class to which every individual belongs, and indicates, upon the first inspection, its respective quality. Every object wears its peculiar livery, and has a distinguishing mark by which it is characterized.

The different hues which are spread over the scenery of the world, are also highly ornamental to the face of nature, and afford a variety of pleasures to the eye and the imagination. It is this circumstance which adds a charm to the fields, the valleys, and the hills, the lofty mountain, the winding river, and the expansive lake; and which gives a splendour and sublimity to the capacious vault of heaven. Colour is, therefore, an essential requisite to every world inhabited by sensitive beings; and we know, that provision has been made for diffusing it throughout all the globes which may exist in the distant regions which our telescopes have penetrated; for the light which radiates from the most distant stars is capable of being separated into the prismatic colours, similar to those which are produced by the solar rays; which furnishes a presumptive proof that they are intended to accomplish designs in their respective spheres analogous to those which light subserves in our terrestrial habitation—or, in other words, that they are destined to convey to the minds of sentient beings, impressions of light and colour, and consequently, beings susceptible of such impressions must reside within the sphere, or more immediate influence of these far-distant orbs.

The same benevolent design is apparent in the *general colour which prevails throughout the scene of subterranean nature*. Had the fields been clothed with hues of a deep red, or a brilliant white, the eye would have been dazzled with the splendour of their aspect. Had a dark-blue or a black colour generally prevailed, it would have cast a universal gloom over the face of nature. But an agreeable green holds the medium between these two extremes, equally remote from a dismal gloom and excessive splendour, and bears such a relation to the structure of the eye, that it refreshes, instead of tiring it, and supports, instead of diminishing its force. At the same time, though one general colour prevails over the landscape of the earth, it is diversified by an admirable variety of shades, so that every individual object in the vegetable world can be accurately distinguished from another; thus producing a beautiful and variegated appearance over the whole scenery of nature. “Who sees not in all these things that the hand of the Lord hath wrought this?”

If from the earth we turn our attention to the

waters, we shall perceive similar traces of the exquisite wisdom and skill of the Author of nature. Water is one of the most essential elementary parts in the constitution of our globe, without which the various tribes of beings which now people it could not exist. It supplies a necessary beverage to man, and to all the animals that people the earth and the air. It forms a solvent for a great variety of solid bodies; it is the element in which an infinitude of organized beings pass their existence; it acts an important part in conveying life and nourishment to all the tribes of the vegetable kingdom, and gives salubrity to the atmospherical regions. Collected in immense masses in the basins of the sea, it serves as a vehicle for ships, and as a medium of communication between people of the most distant lands. Carried along with a progressive motion over the beds of streams and of rivers, it gives a brisk impulse to the air, and prevents the unwholesome stagnation of vapours; it receives the filth of populous cities, and rids them of a thousand nuisances. By its impulsion it becomes the mover of a multitude of machines; and, when rarefied into steam, it is transformed into one of the most powerful and useful agents under the dominion of man. All which beneficial effects entirely depend on the exact degree of density, or specific gravity, which the Creator has given to its constituent parts. Had it been much more rarified than it is, it would have been altogether unfit to answer the purposes now specified; the whole face of the earth would have been a dry and barren waste; vegetable nature could not have been nourished; our floating edifices could not have been supported; the lightest bodies would have sunk, and all regular intercourse with distant nations would have been prevented. On the other hand, had its parts been much denser than they are; for example, had they been of the consistency of a thick jelly, similar disastrous effects would have inevitably followed; no ships could have ploughed the ocean; no refreshing beverage would have been supplied to the animal tribes; the absorbent vessels of trees, herbs, and flowers would have been unable to imbibe, the moisture requisite for their nourishment; and we should thus have been deprived of all the beneficial effects we now derive from the use of that liquid element, and of all the diversified scenery of the vegetable world. But the configuration and consistency of its parts are so nicely adjusted to the constitution of the other elements, and to the wants of the sensitive and vegetable tribes, as exactly to subserve the ends intended in the system of nature.

Water has been ascertained to be a compound body formed by the union of two different kinds of air—oxygen and hydrogen. It has the property of becoming, in certain cases, much lighter than air; though, in its natural liquid state, it is 800 times heavier than that fluid; and has also

the property of afterwards resuming its natural weight. Were it not for this property, evaporation could not be produced ; and, consequently, no clouds, rain, nor dew, could be formed, to water and fertilize the different regions of the earth. But, in consequence of this wonderful property, the ocean becomes an inexhaustible cistern to our world. From its expansive surface are exhaled those vapours which supply the rivers, and nourish the vegetable productions of every land. "The air and the sun," says an elegant writer, "constitute the mighty engine which works without intermission to raise the liquid treasure ; while the clouds serve as so many aqueducts to convey them along the atmosphere, and distribute them, at seasonable periods, and in regular proportions, through all the regions of the globe."

Notwithstanding the properties now stated, *motion was still requisite*, to ensure all the advantages we now derive from the liquid element. Had the whole mass of waters been in a stagnant state, a thousand inconveniences and disastrous consequences would have inevitably ensued. But the All-wise Creator has impressed upon its various masses a circulating motion, which preserves its purity, and widely extends its beneficial influence. The rills pour their liquid stores into the rivers ; the rivers roll their watery treasures into the ocean ; the waters of the ocean, by a libratory motion, roll backwards and forwards every twelve hours, and, by means of currents, and the force of winds, are kept in constant agitation. By the solar heat, a portion of these waters is carried up into the atmosphere, and, in the form of clouds, is conveyed by the winds over various regions ; till, at last, it descends in rain and dew, to supply the springs "which run among the hills." So that there is a constant motion and circulation of the watery element, that it may serve as an agent for carrying forward the various processes of nature, and for ministering to the wants of man and beast.

In fine, were the waters in a state of perpetual stagnation, the filth of populous cities would be accumulated to a most unwholesome degree ; the air would be filled with putrid exhalations ; and the vegetable tribes would languish and die. Were they deprived of the property of being evaporated, (in which state they occupy a space 1400 times greater than in their liquid state,) rain and dew could never be produced, and the earth would be turned into "a dry and parched wilderness ;" neither grass nor corn could be sufficiently dried to lay up for use ; *our clothes, when washed, could never be dried* ; and a variety of common operations, which now conduce to our convenience and comfort, could never be carried on. But the infinite wisdom of the Creator, foreseeing all the effects which can possibly arise from these principles of nature, has effectually provided against such disasters,

by arranging all things, in number, weight and measure, to subserve the beneficial ends for which they were ordained. "He causeth the vapours to ascend from the ends of the earth. he sendeth the springs into the valleys, which run among the hills. They give drink to every beast of the field ; the wild asses quench their thirst. By them the fowls of heaven are refreshed, which sing among the branches. He watereth the hills from his chambers, and the earth is satisfied with the the fruit of his works."

Let us now attend to the *atmosphere*, in the constitution of which the wisdom of God is no less conspicuous than in the other departments of nature.

The atmosphere is one of the most essential appendages to the globe we inhabit, and exhibits a most striking scene of Divine skill and omnipotence. The term *atmosphere* is applied to the whole mass of fluids, consisting of air, vapours, electric fluid, and other matters, which surround the earth to a certain height. This mass of fluid matter gravitates to the earth, revolves with it in its diurnal rotation, and is carried along with it in its course round the sun every year. It has been computed to extend about 45 miles above the earth's surface, and it presses on the earth with a force proportioned to its height and density. From experiments made by the barometer, it has been ascertained, that it presses with a weight of about 15 pounds on every square inch of the earth's surface ; and, therefore, its pressure on the body of a middle-sized man, is equal to about 32,000 lbs. or 14 tons avoirdupois, a pressure which would be insupportable, and even fatal, were it not equal in every part, and counterbalanced by the spring of the air within us. The pressure of the whole atmosphere upon the earth, is computed to be equivalent to that of a globe of lead 60 miles in diameter, or about 5,000,000,000,000,000 tons ; that is, the whole mass of air which surrounds the globe, compresses the earth with a force or power equal to that of *five thousand millions of millions of tons*. \* This amazing pressure is however, essentially necessary for the preservation of the present constitution of our globe, and of the animated beings which dwell on its surface. It prevents the heat of the sun from converting water, and all other fluids on the face of the earth, into vapour ; and preserves the vessels of all organized beings in due tone and vigour. Were the atmospherical pressure entirely removed, the elastic fluids contained in the finer vessels of men and other animals, would inevitably burst them, and life would become extinct ;† and most

\* See Appendix, No. II.

† The necessity of the atmospherical pressure, for the comfort and preservation of animal life, might be illustrated by the effects experienced by those who have ascended to the summits of very high mountains, or who have been carried to a great height above the surface of the earth in balloons

of the substances on the face of the earth, particularly liquids, would be dissipated into vapour.

The atmosphere is now ascertained to be a compound substance, formed of two very different ingredients, termed *oxygen* and *nitrogen* gas. Of 100 measures of atmospheric air, 21 are oxygen, and 79 nitrogen. The one, namely, oxygen, is the principle of combustion, and the vehicle of heat, and is absolutely necessary for the support of animal life, and is the most powerful and energetic agent in nature. The other is altogether incapable of supporting either flame or animal life. Were we to breathe oxygen air, without any mixture or alloy, our animal spirits would be raised, and the fluids in our bodies would circulate with greater rapidity; but we should soon infallibly perish by the rapid and unnatural accumulation of heat in the animal frame. If the nitrogen were extracted from the air, and the whole atmosphere contained nothing but oxygen, or vital air, combustion would not proceed in that gradual manner which it now does, but with the most dreadful and irresistible rapidity: not only wood and coals, and other substances now used for fuel, but even stones, iron, and other metallic substances, would blaze with a rapidity which would carry destruction through the whole expanse of nature. If even the proportions of the two airs were materially altered, a variety of pernicious effects would instantly be produced. If the oxygen were less in quantity than it now is, fire would lose its strength, candles would not diffuse a sufficient light, and animals would perform their vital functions with the utmost difficulty and pain. On the other hand, were the nitrogen diminished, and the oxygen increased, the air taken in by respiration would be more stimulant, and the circulation of the animal fluids would become accelerated; but the tone of the vessels thus stimulated to increased action would be destroyed by too great an excitement, and the body would inevitably waste and decay. Again, were the oxygen completely extracted from the atmosphere, and nothing but nitrogen remained, fire and flame would be extinguished, and instant destruction would be carried throughout all the departments of vegetable and animated nature. For a lighted taper will not burn for a single moment in nitro-

Acosta, in his relation of a journey among the mountains of Peru, states, that "he and his companions were surprised with such extreme pangs of straining and vomiting, not without casting up of blood too, and with so violent a distemper, that they would undoubtedly have died had they remained two or three hours longer in that elevated situation." Count Zambeccari, and his companions, who ascended in a balloon, on the 7th of November, 1783, to a great height, found their hands and feet so swelled, that it was necessary for a surgeon to make incisions in the skin. In both the cases now stated, the persons ascended to so great a height that the pressure of the atmosphere was not sufficient to counterbalance the pressure of the fluids of the body.

gen gas, and if an animal be plunged into it, it is instantly suffocated.

Again, not only the extraction of any one of the component parts of the atmosphere, or the alteration of their respective proportions, but even the slightest increase or diminution of their *specific gravity*, would be attended with the most disastrous effects. The nitrogen is found to be a little lighter than common air, which enables it to rise towards the higher regions of the atmosphere. In breathing, the air which is evolved from the lungs, at every expiration, consists chiefly of nitrogen, which is entirely unfit to be breathed again, and therefore rises above our heads before the next inspiration.—Now, had nitrogen, instead of being a little lighter, been a slight degree heavier than common air, or of the same specific gravity, it would have accumulated on the surface of the earth, and particularly in our apartments, to such a degree as to have produced diseases, pestilence, and death, in rapid succession. But being a little lighter than the surrounding air, it flies upwards, and we never breathe it again, till it enters into new and salutary combinations. Such is the benevolent skill which the Author of Nature has displayed, for promoting the comfort and preservation of every thing that lives.\*

Farther, *were the air coloured*, or were its particles much larger than they are, we could never obtain a distinct view of any other object. The exhalations which rise from the earth, being rendered visible, would disfigure the rich landscape of the universe, and render life disagreeable. But the Almighty, by rendering the air invisible, has enabled us not only to take a delightful and distinct survey of the objects that surround us, but has veiled from our view the gross humours incessantly perspired from animal bodies, the filth exhaled from kitchens, streets, and sewers, and every other object that would excite disgust. Again, *were the different portions of the atmosphere completely stationary*, and not susceptible of agitation,

\* The necessity of atmospherical air for the support of life, was strikingly exemplified in the fate of the unhappy men who died in the *Black-hole* of Calcutta. On the 20th of June, 1756, about 8 o'clock in the evening, 146 men were forced, at the point of the bayonet, into a dungeon only 18 feet square. They had been but a few minutes confined in this infernal prison, before every one fell into a perspiration so profuse, that no idea can be formed of it. This brought on a raging thirst, the most difficult respiration, and an outrageous delirium. Such was the horror of their situation, that every insult that could be devised against the guard without, and all the opprobrious names that the Viceroy and his officers could be loaded with, were repeated, to provoke the guard to fire upon them, and terminate their sufferings. Before 11 o'clock the same evening, one-third of the men were dead; and before 6 next morning, only 23 came out alive, but most of them in a high putrid fever. All these dreadful effects were occasioned by the want of atmospherical air, and by their breathing a superabundant quantity of the nitrogen emitted from their lungs.

all nature would soon be thrown into confusion. The vapours which are exhaled from the sea by the heat of the sun would be suspended, and remain for ever fixed over those places from whence they arose. For want of this agitation of the air, which now scatters and disperses the clouds over every region, the sun would constantly scorch some districts, and be for ever hid from others; the balance of nature would be destroyed; navigation would be useless, and we could no longer enjoy the productions of different climates. In fine, were the atmosphere capable of being frozen, or converted into a solid mass, as all other fluids are, (and we know no reason why it should not be subject to congelation, but the will of the Creator,) the lives of every animal in the air, the waters, and the earth, would, in a few moments, be completely extinguished. But the admirable adjustment of every circumstance, in relation to this useful element, produces all the beneficial effects which we now experience, and strikingly demonstrates, that the intelligent Contriver of all things is "wonderful in counsel, and excellent in working."

From the instances now stated, we may plainly perceive, that if the Almighty had not a particular regard to the happiness of his intelligent offspring, and to the comfort of every animated existence; or, if he wished to inflict summary punishment on a wicked world, he could easily effect, by a very slight change in the constitution of the atmosphere, the entire destruction of the human race, and the entire conflagration of the great globe they inhabit,—throughout all its elementary regions. He has only to extract *one* of its constituent parts, and the grand catastrophe is at once accomplished. With what a striking propriety and emphasis, then, do the inspired writers declare, that, "In Him we live, and move, and have our being;" and that "in His hand is the soul of every living thing, and the breath of all mankind!"

A great variety of other admirable properties is possessed by the atmosphere, of which I shall briefly notice only the following:—It is the vehicle of *smells*, by which we become acquainted with the qualities of the food which is set before us, and learn to avoid those places which are damp, unwholesome, and dangerous. It is the medium of *sounds*, by means of which knowledge is conveyed to our minds. Its undulations, like so many couriers, run for ever backwards and forwards, to convey our thoughts to others, and theirs to us; and to bring news of transactions which frequently occur at a considerable distance. A few strokes on a large bell, through the ministration of the air, will convey signals of distress, or of joy, in a quarter of a minute, to the population of a city containing a hundred thousand inhabitants. So that the air may be considered as the conveyer of the thoughts of mankind, which

are the cement of society. It transmits to our ears all the harmonies of music, and expresses every passion of the soul: it swells the notes of the nightingale, and distributes alike to every ear the pleasures which arise from the harmonious sounds of a concert. It produces the blue colour of the sky, and is the cause of the morning and evening twilight, by its property of bending the rays of light, and reflecting them in all directions. It forms an essential requisite for carrying on all the processes of the vegetable kingdom, and serves for the production of clouds, rain, and dew, which nourish and fertilize the earth. In short, it would be impossible to enumerate all the advantages we derive from this noble appendage to our world. Were the earth divested of its atmosphere, or were only two or three of its properties changed or destroyed, it would be left altogether unfit for the habitation of sentient beings. Were it divested of its undulating quality, we should be deprived of all the advantages of speech and conversation—of all the melody of the feathered songsters, and of all the pleasures of music; and, like the deaf and dumb, we could have no power of communicating our thoughts but by visible signs. Were it deprived of its reflective powers, the sun would appear in one part of the sky of a dazzling brightness, while all around would appear as dark as midnight, and the stars would be visible at noon-day. Were it deprived of its refractive powers, instead of the gradual approach of the day and the night which we now experience, at sunrise, we should be transported all at once from midnight darkness to the splendour of noon-day and, at sunset, should make a sudden transition from the splendours of day to all the horrors of midnight, which would bewilder the traveller in his journey, and strike the creation with amazement. In fine, were the oxygen of the atmosphere completely extracted, destruction would seize on all the tribes of the living world, throughout every region of earth, air, and sea.

Omitting at present the consideration of an indefinite variety of other particulars, which suggest themselves on this subject, I shall just notice one circumstance more, which has a relation both to the waters and to the atmosphere. It is a well-known law of nature, that all bodies are expanded by heat, and contracted by cold. There is only one exception to this law which exists in the economy of our globe, and that is, *the expansion of water, in the act of freezing*. While the parts of every other body are reduced in bulk, and their specific gravity increased by the application of cold; water, on the contrary, when congealed into ice, is increased in bulk, and becomes of a less specific gravity than the surrounding water, and, therefore, swims upon its surface. Now, had the case been otherwise: had water, when deprived of a portion of its heat, followed the general law of nature, and, like all other

bodies, become specifically heavier than it was before, the present constitution of nature would have been materially deranged, and many of our present comforts, and even our very existence, would have been endangered. At whatever time the temperature of the atmosphere became reduced to  $32^{\circ}$  of the common thermometer, or to what is called the freezing point, the water on the surface of our rivers and lakes would have been converted into a layer of ice; this layer would have sunk to the bottom as it froze; another layer of ice would have been immediately produced, which would also have sunk to the former layer, and so on in succession, till, in the course of time, all our rivers from the surface to the bottom, and every other portion of water, capable of being frozen, would have been converted into solid masses of ice, which all the heat of summer could never have melted. We should have been deprived of most of the advantages we now derive from the liquid element, and, in a short time, the face of nature would have been transformed into a frozen chaos. But in the existing constitution of things, all such dismal effects are prevented, in consequence of the Creator having subjected the waters to a law contrary to that of other fluids, by means of which the frozen water swims upon the surface, and prevents the cold from penetrating to any great depth in the subjacent fluid; and when the heat of the atmosphere is increased, is exposed to its genial influence, and is quickly changed into its former liquid state. How admirably, then, does this exception to the general law of nature display the infinite intelligence of the Great Contriver of all things, and his providential care for the comfort of his creatures, when he arranged and established the economy of nature!

#### *Variety of Nature.*

As a striking evidence of Divine Intelligence, we may next consider the *immense variety which the Creator has introduced into every department of the material world.*

In every region on the surface of the globe, an endless multiplicity of objects, all differing from one another in shape, colour, and motion, present themselves to the view of the beholder. Mountains covered with forests, hills clothed with verdure, spacious plains adorned with vineyards, orchards, and waving grain; naked rocks, abrupt precipices, extended vales, deep dells, meandering rivers, roaring cataracts, brooks and rills; lakes and gulfs, bays and promontories, seas and oceans, caverns and grottoes—meet the eye of the student of Nature, in every country, with a variety which is at once beautiful and majestic. Nothing can exceed the variety of the *vegetable kingdom*, which pervades all climates, and almost every portion of the dry land, and of the bed of the ocean. The immense collections of Natural History

which are to be seen in the Museum at Paris, show, that botanists are already acquainted with nearly fifty-six thousand different species of plants.\* And yet, it is probable, that these form but a very small portion of what actually exist, and that several hundreds of thousands of species remain to be explored by the industry of future ages. For, by far the greater part of the vegetable world still remains to be surveyed by the scientific botanist. Of the numerous tribes of vegetable nature which flourish in the interior of Africa and America, in the immense islands of New Holland, New Guinea, Borneo, Sumatra, Java, Ceylon, Madagascar, and Japan; in the vast regions of Tartary, Thibet, Siberia, and the Burman empire; in the Philippines, the Moluccas, the Ladronas, the Carolinas, the Marquesas, the Society, the Georgian, and in thousands of other islands which are scattered over the Indian and Pacific oceans—little or nothing is known by the naturalists of Europe, and yet it is a fact which admits of no dispute, that every country hitherto explored produces a variety of species of plants peculiar to itself; and those districts in Europe which have been frequently surveyed, present to every succeeding explorer a new field of investigation, and reward his industry with new discoveries of the beauties and varieties of the vegetable kingdom. It has been conjectured by some naturalists, on the ground of a multitude of observations, that “there is not a square league of earth, but what presents some one plant peculiar to itself, or, at least, which thrives there better, or appears more beautiful than in any other part of the world.” This would make the number of species of vegetables to amount to as many millions as there are of square leagues on the surface of the earth.

Now, every one of these species of plants differs from another, in its size, structure, form, flowers, leaves, fruits, mode of propagation, colour, medicinal virtues, nutritious qualities, internal vessels, and the odours it exhales. They are of all sizes, from the microscopic mushroom, invisible to the naked eye, to the sturdy oak, and the cedar of Lebanon, and from the slender willow to the banian tree, under whose shade 7000 persons may find ample room to repose. A thousand different shades of colour distinguish the different species. Every one wears its peculiar livery, and is distinguished by its own native hues; and many of their inherent beauties can be distinguished only by the help of the microscope. Some grow upright, others creep along in a serpentine form. Some flourish for ages, others wither and decay in a few months; some spring up in moist, others in dry soils; some turn towards the sun, others shrink and

\* Edinburgh Philosophical Journal, July, 1822. p. 68.

contract when we approach to touch them. Not only are the different species of plants and flowers distinguished from each other, by their different forms, but even the different individuals of the same species. In a bed of tulips or carnations, for example, there is scarcely a flower in which some difference may not be observed in its structure, size, or assemblage of colours; nor can any two flowers be found in which the shape and shades are exactly similar. Of all the hundred thousand millions of plants, trees, herbs, and flowers, with which our globe is variegated, there are not, perhaps, two individuals precisely alike, in every point of view in which they may be contemplated; yea, there is not, perhaps, a single leaf in the forest, when minutely examined, that will not be found to differ, in certain aspects, from its fellows. Such is the wonderful and infinite diversity with which the Creator has adorned the vegetable kingdom.

His wisdom is also evidently displayed in this vast profusion of vegetable nature—in adapting each plant to the soil and situation in which it is destined to flourish—in furnishing it with those vessels by which it absorbs the air and moisture on which it feeds—and in adapting it to the nature and necessities of animated beings. As the earth teems with animated existence, and as the different tribes of animals depend chiefly on the productions of the vegetable kingdom for their subsistence, so there is an abundance and a variety of plants adapted to the peculiar constitutions of every individual species. This circumstance demonstrates, that there is a precontrived relation and fitness between the internal constitution of the animal, and the nature of the plants which afford it nourishment; and shows us, that the animal and vegetable kingdoms are the workmanship of one and the same Almighty Being, and that, in his arrangements with regard to the one, he had in view the necessities of the other.

When we direct our attention to the tribes of *animated nature*, we behold a scene no less variegated and astonishing. Above fifty thousand species of animals have been detected and described by naturalists, besides several thousands of species which the naked eye cannot discern, and which people the invisible regions of the waters and the air. And, as the greater part of the globe has never yet been thoroughly explored, several hundreds, if not thousands, of species unknown to the scientific world may exist in the depths of the ocean, and in the unexplored regions of the land. All these species differ from one another in colour, size, and shape; in the internal structure of their bodies, in the number of their sensitive organs, limbs, feet, joints, claws, wings, and fins; in their dispositions, faculties, movements, and modes of subsistence. They are of all sizes, from the mite and the gnat, up to the elephant and the whale, and from the mite

downwards to those invisible animalcules, a hundred thousand of which would not equal a grain of sand. Some fly through the atmosphere, some glide through the waters, others traverse the solid land. Some walk on two, some on four, some on twenty, and some on a hundred feet. Some have eyes furnished with two, some with eight, some with a hundred, and some with eight thousand distinct transparent globes, for the purpose of vision.\*

Our astonishment at the variety which appears in the animal kingdom is still farther increased when we consider not only the diversities which are apparent in their external aspect, but also in their internal structure and organization. When we reflect on the thousands of movements, adjustments, adaptations, and compensations, which are requisite in order to the construction of an animal system, for enabling it to perform its intended functions;—when we consider, that every species of animals has a system of organization peculiar to itself, consisting of bones, joints, blood-vessels, and muscular motions, differing in a variety of respects from those of any other species, and exactly adapted to its various necessities and modes of existence; and when we consider, still farther, the incomprehensibly delicate contrivances, and exquisite borings, polishings, claspings, and adaptations, which enter into the organization of an animated being ten thousand

\* The eyes of beetles, silk-worms, flies, and several other kinds of insects, are among the most curious and wonderful productions of the God of Nature. On the head of a fly are two large protuberances, one on each side; these constitute its organs of vision. The whole surface of these protuberances is covered with a multitude of small hemispheres placed with the utmost regularity, in rows, crossing each other in a kind of lattice work. These little hemispheres have each of them a minute transparent convex lens in the middle, each of which has a distinct branch of the optic nerve ministering to it; so that the different lenses may be considered as so many distinct eyes. Mr. Leeuwenhoek counted 8236 in the two eyes of a silk-worm, when in its fly state; 2180 in each eye of the beetle; and 8000 in the two eyes of a common fly. Mr. Hook reckoned 14,000 in the eyes of a drone fly; and, in one of the eyes of a dragon fly there have been reckoned 13,500 of these lenses, and, consequently, in both eyes, 27,000, every one of which is capable of forming a distinct image of any object, in the same manner as a common convex glass; so that there are 27,000 images formed on the retina of this little animal. Mr. Leeuwenhoek having prepared the eye of a fly for the purpose, placed it a little farther from his microscope than when he would examine an object, so as to leave a proper local distance between it and the lens of his microscope; and then looked through both, in the manner of a telescope, at the steeple of the church, which was 299 feet high, and 750 feet distant, and could plainly see through every little lens, the whole steeple inverted, though not larger than the point of a fine needle: and then directing it to a neighbouring house, saw through many of these little hemispheres, not only the front of the house, but also the doors and windows, and could discern distinctly whether the windows were open or shut. Such an exquisite piece of Divine mechanism transcends all human comprehension.

things less than a mite ; and that the different species of those animals are likewise all differently organized from one another,—we cannot but be struck with reverence and astonishment, at the *Intelligence* of that Incomprehensible Being who arranged the organs of all the tribes of animated nature, who “breathed into them the breath of life,” and who continually upholds them in all their movements !

Could we descend into the subterraneous apartments of the globe, and penetrate into those unknown recesses which lie towards its centre, we should, doubtless, behold a variegated scene of wonders, even in those dark and impenetrable regions. But all the labour and industry of man have not hitherto enabled him to penetrate farther into the bowels of the earth than the six thousandth part of its diameter ; so that we must remain for ever ignorant of the immense caverns and masses of matter that may exist, and of the processes that may be going on, about its central regions. In those regions, however, near the surface, which lie within the sphere of human inspection, we perceive a variety analogous to that which is displayed in the other departments of nature. Here we find substances of various kinds formed into strata, or layers, of different depths—earths, sand, gravel, marl, clay, sandstone, freestone, marble, limestone, fossils, coals, peat, and similar materials. In these strata are found metals and minerals of various descriptions—salt, nitrate of potash, ammonia, sulphur, bitumen, platina, gold, silver, mercury, iron, lead, tin, copper, zinc, nickel, manganese, cobalt, antimony, the diamond, rubies, sapphires, jaspers, emeralds, and a countless variety of other substances, of incalculable benefit to mankind. Some of these substances are so essentially requisite for the comfort of man, that, without them, he would soon degenerate into the savage state, and be deprived of all those arts which extend his knowledge, and which cheer and embellish the abodes of civilized life.

If we turn our eyes upward to the regions of the atmosphere, we may also behold a spectacle of variegated magnificence. Sometimes the sky is covered with sable clouds, or obscured with mists ; at other times it is tinged with a variety of hues, by the rays of the rising or the setting sun. Sometimes it presents a pure azure, at other times it is diversified with strata of dappled clouds. At one time we behold the rainbow rearing its majestic arch, adorned with all the colours of light ; at another, the Aurora Borealis illuminating the sky with its fantastic coruscations. At one time we behold the fiery meteor sweeping through the air ; at another, we perceive the forked lightning darting from the clouds, and hear the thunders rolling through the sky. Sometimes the vault of heaven appears like a boundless desert, and at other times adorned with an innumerable host of stars, and with the moon “walking in brightness.” In short, whether we direct our

view to the vegetable or the animal tribes, to the atmosphere, the ocean, the mountains, the plains, or the subterranean recesses of the globe, we behold a scene of beauty, order, and variety, which astonishes and enraptures the contemplative mind, and constrains us to join in the devout exclamations of the Psalmist, “*How manifold are thy works, O Lord ! In wisdom hast thou made them all, the earth is full of thy riches ; so is the great and wide sea, wherein are things creeping, innumerable, both small and great beasts.*”

This countless variety of objects which appears throughout every department of our sublunary system, not only displays the depths of Divine wisdom, but also presents us with a faint idea of the *infinity* of the Creator, and of the *immense multiplicity of ideas and conceptions* which must have existed in the Eternal Mind, when the fabric of our globe, and its numerous tribes of inhabitants, were arranged and brought into existence. And, if every other world which floats in the immensity of space be diversified with a similar variety of existence, altogether different from ours, (as we have reason to believe, from the variety we already perceive, and from the boundless plans and conceptions of the Creator,) the human mind is lost and confounded, when it attempts to form an idea of those endlessly diversified plans, conceptions, and views, which must have existed during an eternity past, in the Divine mind. When we would attempt to enter into the conception of so vast and varied operations, we feel our own littleness, and the narrow limits of our feeble powers, and can only exclaim, with the Apostle Paul, “Oh the depth of the riches both of the wisdom and knowledge of God ! how unsearchable are his counsels, and his ways of creation and providence past finding out.”

This characteristic of variety, which is stamped on all the works of Omnipotence, is doubtless intended to gratify the principle of curiosity and the love of novelty, which are implanted in the human breast ; and thus to excite rational beings to the study and investigation of the works of the Creator ; that therein they may behold the glory of the Divine character, and be stimulated to the exercise of love, admiration, and reverence. For as the records of revelation, and the dispensations of providence, display to us the various aspects of the moral character of Deity, so, the diversified phenomena, and the multiplicity of objects and operations which the scenery of nature exhibits, present to us a specimen of the *ideas*, as it were, of the Eternal Mind, in so far as they can be adumbrated by material objects, and exhibited to mortals, through the medium of corporeal organs.

To convey an adequate conception of the number of these ideas, as exhibited on the globe in which we live, would baffle the arithmetician's skill, and set his numbers at defiance. We may, however, assist our conceptions a little, by

contract when we approach to touch them. Not only are the different species of plants and flowers distinguished from each other, by their different forms, but even the different individuals of the same species. In a bed of tulips or carnations, for example, there is scarcely a flower in which some difference may not be observed in its structure, size, or assemblage of colours; nor can any two flowers be found in which the shape and shades are exactly similar. Of all the hundred thousand millions of plants, trees, herbs, and flowers, with which our globe is variegated, there are not, perhaps, two individuals precisely alike, in every point of view in which they may be contemplated; yea, there is not, perhaps, a single leaf in the forest, when minutely examined, that will not be found to differ, in certain aspects, from its fellows. Such is the wonderful and infinite diversity with which the Creator has adorned the vegetable kingdom.

His wisdom is also evidently displayed in this vast profusion of vegetable nature—in adapting each plant to the soil and situation in which it is destined to flourish—in furnishing it with those vessels by which it absorbs the air and moisture on which it feeds—and in adapting it to the nature and necessities of animated beings. As the earth teems with animated existence, and as the different tribes of animals depend chiefly on the productions of the vegetable kingdom for their subsistence, so there is an abundance and a variety of plants adapted to the peculiar constitutions of every individual species. This circumstance demonstrates, that there is a precontrived relation and fitness between the internal constitution of the animal, and the nature of the plants which afford it nourishment; and shows us, that the animal and vegetable kingdoms are the workmanship of one and the same Almighty Being, and that, in his arrangements with regard to the one, he had in view the necessities of the other.

When we direct our attention to the tribes of animated nature, we behold a scene no less variegated and astonishing. Above fifty thousand species of animals have been detected and described by naturalists, besides several thousands of species which the naked eye cannot discern, and which people the invisible regions of the waters and the air. And, as the greater part of the globe has never yet been thoroughly explored, several hundreds, if not thousands, of species unknown to the scientific world may exist in the depths of the ocean, and in the unexplored regions of the land. All these species differ from one another in colour, size, and shape; in the internal structure of their bodies, in the number of their sensitive organs, limbs, feet, joints, claws, wings, and fins; in their dispositions, faculties, movements, and modes of subsistence. They are of all sizes, from the mite and the gnat, up to the elephant and the whale, and from the mite

downwards to those invisible animalcules, a hundred thousand of which would not equal a grain of sand. Some fly through the atmosphere, some glide through the waters, others traverse the solid land. Some walk on two, some on four, some on twenty, and some on a hundred feet. Some have eyes furnished with two, some with eight, some with a hundred, and some with eight thousand distinct transparent globes, for the purpose of vision.\*

Our astonishment at the variety which appears in the animal kingdom is still farther increased when we consider not only the diversities which are apparent in their external aspect, but also in their internal structure and organization. When we reflect on the thousands of movements, adjustments, adaptations, and compensations, which are requisite in order to the construction of an animal system, for enabling it to perform its intended functions;—when we consider, that every species of animals has a system of organization peculiar to itself, consisting of bones, joints, blood-vessels, and muscular motions, differing in a variety of respects from those of any other species, and exactly adapted to its various necessities and modes of existence; and when we consider, still farther, the incomprehensibly delicate contrivances, and exquisite borings, polishings, claspings, and adaptations, which enter into the organization of an animated being ten thousand

\* The eyes of beetles, silk-worms, flies, and several other kinds of insects, are among the most curious and wonderful productions of the God of Nature. When we would attempt to enter into the conception of so vast and varied operations, we feel our own littleness, and the narrow limits of our feeble powers, and can only exclaim, with the Apostle Paul, “Oh the depth of the riches both of the wisdom and knowledge of God ! how unsearchable are his counsels, and his ways of creation and providence past finding out.”

This characteristic of variety, which is stamped on all the works of Omnipotence, is doubtless intended to gratify the principle of curiosity and the love of novelty, which are implanted in the human breast ; and thus to excite rational beings to the study and investigation of the works of the Creator ; that therein they may behold the glory of the Divine character, and be stimulated to the exercise of love, admiration, and reverence. For as the records of revelation, and the dispensations of providence, display to us the various aspects of the moral character of Deity, so, the diversified phenomena, and the multiplicity of objects and operations which the scenery of nature exhibits, present to us a specimen of the ideas, as it were, of the Eternal Mind, in so far as they can be adumbrated by material objects, and exhibited to mortals, through the medium of corporeal organs.

To convey an adequate conception of the number of these ideas, as exhibited on the globe in which we live, would baffle the arithmetician’s skill, and set his numbers at defiance. We may, however, assist our conceptions a little, by

confining our attention to one department of nature, for example, the **ANIMAL KINGDOM**. The number of the different species of animals, taking into account those which are hitherto undiscovered, and those which are invisible to the naked eye, cannot be estimated at less than 300,000. In a human body there are reckoned about 446 muscles, in each of which according to anatomists, there are at least 10 several intentions, or due qualifications to be observed—its proper figure, its just magnitude, the right disposition of its several ends, upper and lower, the position of the whole, the insertion of its proper nerves, veins, arteries, &c. so that in the muscular system alone there are 4,460 several ends or aims to be attended to. The bones are reckoned to be in number about 245, and the distinct scopes or intentions of each of these are above 40; in all, about 9,800; so that the system of bones and muscles alone, without taking any other parts into consideration, amounts to about 14,000 different intentions or adaptations. If now, we suppose, that all the species of animals above stated are differently constructed, and, taken one with another, contain at an average a system of bones and muscles as numerous as in the human body—the number of species must be multiplied by the number of different aims or adaptations, and the product will amount to 4,200,000,000. If we were next to attend to the many thousands of blood vessels in an animal body, and the numerous ligaments, membranes, humours, and fluids of various descriptions—the skin, with its millions of pores, and every other part of an organical system, with the aims and intentions of each, we should have another sum of many hundreds of millions to be multiplied by the former product, in order to express the diversified ideas which enter into the construction of the animal world. And, if we still farther consider, that of the hundreds of millions of individuals belonging to each species, no two individuals exactly resemble each other—that all the myriads of vegetables with which the earth is covered, are distinguished from each other, by some one characteristic or another, and that every grain of sand contained in the mountains, and in the bed of the ocean, as shown by the microscope, discovers a different form and configuration from another—we are here presented with an image of the *infinity* of the conceptions of Him in whose incomprehensible mind they all existed, during countless ages, before the universe was formed.

To overlook this amazing scene of Divine Intelligence, or to consider it as beneath our notice as some have done—if it be not the characteristic of impiety, is, at least, the mark of a weak and undiscriminating mind. The man who disregards the visible displays of Infinite Wisdom, or who neglects to investigate them, when opportunity offers, acts as if he considered himself already possessed of a sufficient portion of intelligence, and stood in no need of sensible

assurances to direct his conceptions of the Creator. Pride, and false conceptions of the nature and design of true religion, frequently lie at the foundation of all that indifference and neglect with which the visible works of God are treated, by those who make pretensions to a high degree of spiritual attainments. The truly pious man will trace, with wonder and delight, the footsteps of his Father and his God, wherever they appear in the variegated scene of creation around him, and will be filled with sorrow, and contrition of heart, that, amidst his excursions and solitary walks, he has so often disregarded “the works of the Lord, and the operation of his hands.”

In fine, the variety which appears on the face of nature, not only enlarges our conceptions of Infinite Wisdom, but is also the foundation of all our discriminations and judgments as rational beings, and is of the most essential utility in the affairs of human society. Such is the variety of which the features of the human countenance are susceptible, that it is probable that no two individuals, of all the millions of the race of Adam that have existed since the beginning of time, would be found to resemble each other. We know no two human beings presently existing, however similar to each other, but may be distinguished either by their stature, their forms, or the features of their faces; and on the ground of this dissimilarity, the various wheels of the machine of society move onward, without clashing or confusion. Had it been otherwise—had the faces of men and their organs of speech been cast exactly in the same mould, as would have been the case, had the world been framed according to the Epicurean system, by blind chance directing a concourse of atoms, it might have been as difficult to distinguish one human countenance from another, as to distinguish the eggs laid by the same hen, or the drops of water which trickle from the same orifice; and consequently, society would have been thrown into a state of universal anarchy and confusion. Friends would not have been distinguished from enemies, villains from the good and honest, fathers from sons, the culprit from the innocent person, nor the branches of the same family from one another. And what a scene of perpetual confusion and disturbance would thus have been created! Frauds, thefts, robberies, murders, assassinations, forgeries, and injustice of all kinds, might have been daily committed without the least possibility of detection. Nay, were even the *variety of tones* in the human voice, peculiar to each person, to cease, and the *handwriting* of all men to become perfectly uniform, a multitude of distressing deceptions and perplexities would be produced in the domestic, civil, and commercial transactions of mankind. But the All-wise and Beneficent Creator has prevented all such evils and inconveniences, by the character of *variety* which he has impressed on the human species; and on all his works. By the

peculiar features of his countenance every man may be distinguished in the light; by the tones of his voice he may be recognized in the dark, or when he is separated from his fellows by an impenetrable partition; and his handwriting can attest his existence and individuality, when continents and oceans interpose between him and his relations, and be a witness of his sentiments and purposes to future generations.

Thus, I have taken a very cursory view of some evidences of Divine Wisdom, which appear in the general constitution of the earth, the waters, and the atmosphere, and in the characteristic of variety, which is impressed on all the objects of the visible creation. When these and other admirable arrangements, in our sublunary system, are seriously contemplated, every rational and pious mind will be disposed to exclaim with the Psalmist—"There is none like unto thee, O Lord, neither are there any works like unto thy works."—"Thou art great, and dost wondrous things, thou art God alone."—"O that men would praise the Lord for his goodness, and for his wonderful works towards the children of men!"

When we consider not only the utility, but the beauty and grandeur of the wise arrangements of nature, what reason have we to admire and adore the goodness of the great Author of our existence! Were all the diversities of shape and colour, of mountains and vales, of rivers and lakes, of light and shade, which now embellish the various landscapes of the world, to disappear, and were one unvaried scene perpetually to present itself to the eye, how dull and wearisome, and uninteresting, would the aspect of the universe appear to an intelligent mind! Although the variegated beauties which adorn the surface of our globe, and the vault of heaven, are not essential to our existence, as sensitive beings, yet, were they completely withdrawn, and nothing presented to the eye but a boundless expanse of barren sands, the mind would recoil upon itself, its activity would be destroyed, its powers would be confined, as it were, to a prison, and it would roam in vain amidst the surrounding waste, in search of enjoyment. Even the luxuries of a palace, were it possible to procure them amidst such a scene of desolation, would become stale and insipid, and would leave the rational soul, almost destitute of ideas and of mental energy, to the tiresome round of a cheerless existence. But in the actual state of the world we live in, there is no landscape in nature, from the icebergs of Greenland to the verdant scenes of the torrid zone, in which objects, either of sublimity or of beauty, in boundless variety, are not presented to the view; in order to stimulate the mind to activity, to gratify its desire of novelty, and to elevate its conceptions of the Beneficent Creator.

And, if the present constitution of our world

displays so evident marks of beauty and benevolent design, now that it is inhabited by an assemblage of depraved intelligences, and its physical aspect deformed, in consequence of "the wickedness of man"—what transporting beauties and sublimities must it have presented, when it appeared fresh from the hand of its Almighty Maker, and when all things were pronounced by him to be very good? After a deluge of waters has swept away many of its primeval beauties, and has broken and deranged even its subterraneous strata, this terrestrial world still presents to the eye a striking scene of beauty, order, and beneficence. But we have the strongest reason to believe, that before sin had disfigured the aspect of this lower world, all was "beauty to the eye, and music to the ear"—that "immortality breathed in the winds, flowed in the rivers," and exhaled from every plant and flower. No storms disturbed the tranquillity of nature, nor created the least alarm in the breasts of its holy inhabitants. No earthquakes shook the ground, nor rent the foundations of nature. No volcanoes vomited their rivers of lava, nor overwhelmed the plains with deluges of fire. No barren deserts of heath and sand disfigured the rich landscape of the world—no tempests nor hurricanes tossed the ocean, nor scorching heats, nor piercing colds, nor pestilence, nor disease, annoyed the human frame. In the paradisaical state of the world, we may reasonably suppose, that all the elements of nature contributed directly to the pleasure and enjoyment of man, and of the other tribes of animated nature; and that they were not subjected, as they now are, to the operation of those natural agents which so frequently spread destruction and ruin among the abodes of men. To suppose the contrary to have happened, would be inconsistent with the state of pure and happy intelligences, and with the benignity of the Creator; and would imply, that God was either unwilling or unable to remove such physical evils. But we cannot suppose it beyond the limits of Infinite Wisdom and Omnipotence, to create and arrange a world entirely free from those evils and inconveniences which now flow from the operation of certain physical agents; without, at the same time, supposing that his power and intelligence are confined within certain bounds, beyond which they cannot pass. And, therefore, if, in the existing constitution of things, the harmony of nature is occasionally disturbed, and its beauty defaced, by earthquakes, storms, and tempests—we must remember, that the inhabitants of the earth are now a depraved race of mortals, no longer adorned with primeval purity and innocence; and that the physical economy of our globe has undergone a certain derangement, corresponding to the moral state of its present occupants. But since this earth, even in its present state of degradation and derangement, presents to the view of every beholder so many objects of beauty and magnificence,

and so numerous traces of Divine Beneficence—we may reasonably conclude, that scenes of Divine Wisdom and Goodness, far more glorious and transporting, must be displayed in those worlds where moral evil has never shed its malignant influence, and where the inhabitants—superior to disease and death—bask for ever in the regions of immortality. And, therefore, however admirable the displays of Divine Wisdom may appear in the sublunary scene around us, they must be considered as inferior to those which are exhibited in many other provinces of Jehovah's empire, in so far as they are blended with those physical derangements which indicate his displeasure against the sins of men.

Were we now to direct our attention to the mechanism of animated beings, and to consider the numberless contrivances and adaptations in their organical structure and functions, a thousand instances of exquisite wisdom and design, still more striking and admirable, would crowd upon our view. For, although the general fabric of the world, and the immense variety of objects it contains, are evident proofs of a Wise and Intelligent Contriver, yet it is chiefly in the minute and delicate contrivances of organical structures, their adaptation to the purposes of life, motion, and enjoyment, and their relation and correspondence to the surrounding elements, that the consummate skill of the Great Architect of nature is most strikingly perceived. But as it forms no part of my present plan to enter on so extensive a field of illustration, on which volumes might be written, I shall content myself with merely stating an example or two. My first example shall be taken from

#### *The Structure of the Human Eye.*

The eye is one of the nicest pieces of mechanism which the human understanding can contemplate; but as it requires a knowledge of its anatomical structure, and of the principles of optics, to enable us to appreciate its admirable functions, I shall confine myself to a few general descriptions and remarks.

The eye is nearly of a globular form. It consists chiefly of three coats, and three humours. The first or outer coat, is termed *sclerotica*; it is every where white and opaque, and is joined at its anterior edge to another which has more convexity than any other part of the globe of the eye, and, being exceedingly transparent, is called the *cornea*. These two parts are perfectly different in their structure, and are supposed, by some anatomists, to be as distinct from each other as the glass of a watch is from the case into which it is fixed. Next within this coat is that called the *choroides*, on account of its being furnished with a great number of vessels. It serves, as it were, for a lining to the other, and is joined

with that part of the eye termed *iris*. The *iris* is an opaque membrane like the *choroides*, but of different colours in different eyes, as gray, black, or hazel. It is composed of two sets of muscular fibres, the one of a circular form, which contracts the hole in the middle, called the *pupil*, when the light is too strong for the eye; and the other, of radial fibres, tends every where from the circumference of the *iris* towards the middle of the *pupil*; which fibres, by their contractions, dilate and enlarge the *pupil*, when the light is weak, in order to let in more of its rays. The third coat is called the *retina*, upon which are painted the images of all visible objects, by the rays of light which flow from them. It spreads like net-work all over the inside of the *choroides*, and is nothing more than a fine expansion of the optic nerve; by which nerve the impressions of visible objects are conveyed to the brain.

The inside of the globe of the eye, within these tunics or coats, is filled with three humours, called the aqueous, the crystalline, and the vitreous. The aqueous humour lies at the fore part of the eye, and occupies all the space between the crystalline and the prominent cornea. It has the same specific gravity and refractive power as water, and seems chiefly of use to prevent the crystalline from being easily bruised by rubbing, or by a blow—and perhaps it serves for the crystalline humour to move forward in, while we view near objects, and backward for remoter objects; without which, or some other mechanism effecting the same purpose, we could not, according to the laws of optics, perceive objects distinctly, when placed at different distances. Behind the aqueous lies the crystalline humour, which is shaped like a double convex glass, and is a little more convex on the back than on the fore part. This humour is transparent like crystal, is nearly of the consistence of hard jelly, and converges the rays which pass through it, from visible objects, to its focus at the bottom or back part of the eye. The vitreous humour lies behind the crystalline, and fills up the greatest part of the orb of the eye, giving it a globular shape. It is nearly of the consistence of the white of an egg, and very transparent; its fore part is concave, for the crystalline humour to lodge in, and its back part being convex, the retina is spread over it. It serves as a medium to keep the crystalline humour and the retina at due distance. From what has now been stated, it is obvious, that the images of external objects are depicted in the retina, in an inverted position, in the same manner as the images formed by a common convex lens; but how the mind, in this case, perceives objects erect, is a question, about which the learned have divided in their opinions.\*

\* An Idea of the relative positions of the coats and humours described above, may be obtained by a simple inspection of the Plate, Fig. 6.—Fig. 8, represents a front view of the human eye, as 't ap-

The ball of the eye, as now described, is situated in a bony cavity, called its orbit, composed by the junction of seven different bones, hollowed out at their edges. This cavity is in all the vacant spaces filled with a loose fat, which serves as a proper medium for the eye to rest in, and as a socket in which it may move. It is sheltered by the eyebrows, which are provided with hair, to prevent the descending sweat of the forehead from running down into it. As a still farther protection to this delicate organ, it is furnished with the eyelid, which, like a curtain, is drawn over it with inconceivable swiftness, for its security, on the approach of danger. It also serves to wipe it from superfluous moisture, and to cover it during sleep. In the upper part of its orbit, it is furnished with a gland, to supply it with water sufficient to wash off dust, and to keep its outer surface moist, without which the cornea would be less transparent, and the rays of light would be disturbed in their passage; and the superfluous water is conveyed to the nose through a perforation in the bone.

For the purpose of enabling the eye to move in its socket, *six muscles* are provided. These are admirably contrived to move it in every direction, upwards or downwards, to the right or to the left, or in whatever direction the occasion may require; and thus we are spared the trouble of turning our heads continually towards the objects we wish to inspect. If we want to look upward, one of these muscles lifts up the orb of the eye; if we would cast our eyes to the ground, another muscle pulls them down. A third muscle moves the globe outwards towards the temples, and a fourth draws it towards the nose. A fifth, which slides within a cartilaginous ring, like a cord over a pulley, and is fastened to the globe of the eye in two points, makes it roll about at pleasure. A sixth lies under the eye, and is designed to temper and restrain, within proper bounds, the action of the rest, to keep it steadily fixed on the object it beholds, and to prevent those frightful contortions which otherwise might take place. By these, and a multitude of other mechanical contrivances, all acting in harmonious combination, the eye, as a natural telescope and microscope, is made to advance, to recede, to move to the right and to the left, and in every other direction; and to view near and distant objects with equal distinctness; so that a single eye, by the variety of positions it may assume, performs the office of a thousand.\*

The utility of these several movements, and the pain and inconvenience which would be suffered, were any of them wanting, can scarcely be

seen in its natural state, and exhibits the relative positions of the *Cornea*, *Iris*, and *Pupil*.

\* Flies and other insects, whose eyes are immoveable, have several thousands of distinct globes in each eye. See note page 28.

conceived, by any one whose eyes have always remained in a sound state. We are so much accustomed to the regular exercise of our visual organs, that we seldom reflect on the numerous delicate springs which must be set in action, before the functions of vision can, with ease, be performed. But were any one of the muscular organs, now described, to fail in its functions, we should soon experience so many inconveniences, as would throw a gloom on all the other comforts of life; and convince us, how much we are indebted, every moment, to the provident care and goodness of our Beneficent Creator, for thousands of enjoyments which we seldom think of, and for which we are never sufficiently grateful.—“With much compassion, as well as astonishment at the goodness of our loving Creator,” says Dr. Nieuwentyt, “have I considered the sad state of a certain gentleman, who, as to the rest, was in pretty good health, but only wanted the use of those two little muscles that serve to lift up the eyelid, and so had almost lost the use of his sight—being forced, as long as this defect lasted, to shove up his eyelids every moment, with his own hands.”†

How admirable, then, is the formation of the eye, and how grateful ought we to feel at the consideration, that we are permitted to enjoy all the transporting pleasures of vision, without the least perplexity or effort on our part! If the loss of action in a single muscle produces so many distressing sensations and efforts, what would be the consequence if all the muscles of the eye were wanting or deranged? And is it man that governs these nice and intricate movements? or is it the eye itself, as a self-directing machine, that thus turns around, seasonably and significantly, towards every visible object? Man knows neither the organs of vision, nor the functions they ought to perform. The eye is only an unconscious machine, in the hands of a Superior Intelligence, as a watch, or a steam engine, is in the hands of a mechanic. It is God alone who constantly performs its movements, according to certain laws, which he has submitted to our inclinations and desires; “*for in him we live and move.*” We are *desirous* to see certain objects around us: this is all the share we have in the operations of our eyes; and without perplexing our understanding, without the least care or management, in regard to any of the functions, we can, in a few moments, take a survey of the beauties and sublimities of an extensive landscape, and of the glories of the vault of heaven. Thus, the Divine Being operates not only in this, but in a thousand different ways, in the various senses and contrivances which belong to our animal system; and yet, thoughtless and ungrateful man often inquires, in the language of doubt

† Nieuwentyt's Religious Philosopher, vol. i, p. 202.

and hesitation, "Where is God my Maker?" He is in us, and around us, directing every movement in our animal frame to act in harmony with the surrounding elements, and to minister to our enjoyments; and it is only when his exquisite operations are deranged by external violence, that we feel inconvenience or pain.

Such are only a few general outlines of the structure of the eye: for no notice has been taken of the numerous minute veins, arteries, nerves, lymphatics, glands, and many other particulars which are connected with this organ. But all this delicate and complicated apparatus, in the structure of the eye, would have been of no use whatever for the purpose of vision, had not a distinct substance been created to act upon it, exactly adapted to its nature and functions. In order that the eye might serve as the medium of our perceptions of visible objects, *light* was formed, and made to travel from its source at the rate of 195,000 miles in a second of time. This prodigious velocity of light is, doubtless, essential to the nature of vision; since it actually exists, and since we find that it radiates with the same swiftness from the most distant visible star, as from the sun which enlightens our system. To abate the force of this amazing velocity, its particles have been formed almost infinitely small—a circumstance which alone prevents this delightful visitant from becoming the most tremendous and destructive element in nature. Dr. Nieuwentyt has computed, that, in one second of time, there flows 418,880,000,000,000,000,000,000,000,000,000,000,000,000,000\* particles of light out of a burning candle, which number contains at least 6,337,242,000,000 times the number of grains of sand in the whole earth, supposing every cubic inch of the earth to contain a million of grains. It has been justly remarked, by Mr. Ferguson and other authors, that "if the particles of light were so large, that a million of them were equal in bulk to an ordinary grain of sand, we durst no more open our eyes to the light, than suffer sand to be shot point blank against them, from the mouth of a cannon." It may also be remarked, that the property which all bodies possess, of *reflecting* light, is essential to the purpose of vision, without which, the splendid and variegated scene of nature would be changed into a dreadful gloom; and were the rays of light of one uniform colour, and not compounded of various hues, one object could not be distinguished from another, and the beautiful aspect of our globe would instantly disappear.

Thus we see, that the eye is adapted to light, and light to the eye; and in this admirable adaptation the wisdom of the Creator is strikingly displayed. For light has no effect upon the ear, or upon any other organ of sensation; so as to

produce a perception of visible objects; as, on the other hand, the undulations of the air have no effect upon the eye, so as to produce the sensation of sound. The eye did not produce the light, nor did the light form the eye; they are perfectly distinct from each other, yet so nicely adapted in every particular, that had any one quality or circumstance been wanting in either, the functions of vision could not have been performed in the manner in which they now operate, which strikingly demonstrates, that one and the same Intelligent Being, possessed of a wisdom beyond our comprehension, formed the curious structure of the eye, and endued the rays of light with those properties of colour, motion, and minuteness, which are calculated, through the medium of this organ, to produce, in sentient beings, the ideas of visible objects. And, surely, he never intended that such exquisite skill and contrivance should be altogether overlooked by rational beings, for whose pleasure and enjoyment all this benevolent care is exercised.

#### *Manner in which vision is performed.*

Let us now attend a little to the manner in which vision is performed, by the medium of light acting on the organs of sight. If we take a common convex glass—a reading glass for example—and hold it at some distance from a candle or a window sash, placing a piece of white paper behind the glass, at the distance of its focus, the image of the candle or sash will be painted on the paper, in an inverted position. This experiment may be performed, with a better effect, by darkening a room, and placing the convex glass in a hole cut out of the window shutter, when the rays of light flowing from the objects without, and passing through the glass, will form a picture of the objects opposite the window, on the white paper, adorned with the most beautiful colours. In a manner similar to this, are the images of external objects depicted on the back part of the inner coat or membrane of the eye. The rays of light, proceeding in all directions, from surrounding objects, and falling on the eye, are transmitted through the pupil; and being refracted by the different humours, (particularly by the *crystalline* humour, which acts the part of a convex lens,) they converge to a focus on the *retina*, where the images of visible objects are painted in an inverted position; and, by means of the optic nerve, these images are conveyed to the mind.

The following figure will perhaps more distinctly illustrate this point. Let *a, b, c, s, y*, represent the globe of the eye, and *A, B, C*, an object at a certain distance from it. Now, it is well known that every point of a visible object sends out rays of light in all directions; and, therefore, a certain portion of the rays which flow from the object *A B C*, will fall upon the cornea, between *s* and *y*, and, passing through the

\* See Appendix, No. V

aqueous humour, *m, n*, and the crystalline humour *a, p*, and the vitreous humour, *D, E*, will be converged to a focus on the retina, and paint a distinct picture, *a b c*, of the object *A B C*, in an inverted position. The rays from the point *A* of the object, after being refracted by the different humours, will be brought to a point at *a*; those from *B* will be converged at *b*; and those from *C* at *c*; and, of course, the intermediate rays between *A B*, and *B C*, will be formed between *a b*, and *b c*, and the object will become visible by means of its image or representation being painted on the retina, in all the colours and proportions which belong to it. If we take a bull-horn's eye, and cut off the three sides from the back part, and put a piece of thin white paper over that part, and hold the eye towards the window or any bright object, we shall see the image of the object depicted upon the paper, and in an inverted position, as stated above.

In order that we may more distinctly perceive the wonders of vision, and the numerous circumstances on which it depends, let us suppose ourselves placed on an eminence, which commands a view of a variegated and extensive landscape. Let us suppose ourselves stationed on Arthur's seat, or on the top of Salisbury Crags, in the vicinity of Edinburgh. Turning our face to the north-west, the city, with its castles, spires, and stately edifices, presents itself to our view. Beyond it, on the north and west, a beautiful country, adorned with villas, plantations, and fertile fields, stretches as far as the eye can reach, till the view is bounded by the castle of Stirling, at the distance of more than thirty miles. On the right hand, we behold the part of Loth, the shipping in the roads, the coast of Fife, the isles of Inchkeith and of May, and the Frith of Forth, gradually losing itself in the German ocean. If we suppose the length of this landscape to be sixty miles, and its breadth twenty-five, it will, of course, comprehend an area of a thousand square miles.

The first circumstance which strikes the mind, is the immense multitude of rays of reflected light which flow, in all directions, from the myriads of objects which compose the surrounding scene. In order to form a rude idea of this infinity of radiations, I fix my attention on a single object—I direct my eye to Nelson's monument, or the Calton hill. From the parapet at the top, a thousand different points send forth a thousand differ-

ent masses of rays, which, entering my eye, render the different parts of it distinctly visible, besides myriads of rays from the same points, which flow in every other direction through the open spaces of the atmosphere which surround them. How many thousands of millions, then, of different radiations, must be issuing forth every moment from the whole mass of the scene! And if one object pours forth such a flood of rays, how immense must be the number of radiations which are issuing from all the objects which compose this extensive landscape! Myriads of rays, from myriads of objects, must be crisscrossing each other in an infinity of directions, so that the mind is confounded at the apparent confusion which seems to exist in this immensity of radiations; yet every ray passes forward in the crowd, in the most perfect order, and without being blended or confused with any other ray, produces its specific effect on every eye that is open to receive it. But this is not all: these millions of rays which flow from the minutest points of the surrounding scene, before they can produce the sensation of vision, and form a picture of the landscape on the retina, must be compressed into a space little more than one-eighth of an inch in diameter, before they can enter the pupil of the eye; yet they all pass through this small aperture without the least confusion, and paint the images of their respective objects in exactly the same order in which those objects are arranged. Another circumstance demands attention. The rays which proceed from the objects before me are not all directed to the spot where I stand, but are diffused throughout every point of the surrounding space, ready to produce the same effect, whenever sentient beings are present to receive them. Were the whole inhabitants of Edinburgh placed on the sloping declivity of Arthur's seat, and along the top of Salisbury Crags, and were millions of other spectators suspended in the surrounding atmosphere, similar sensations would be produced, and a scene similar to that which I now behold, would be depicted in every eye. Amidst the infinity of masses of light, crisscrossing each other in an infinity of directions, no confusion would ensue, but every spectator, whose eyes were in a sound state, would obtain a correct view of the scene before him; and hence it happens, that, whenever I shift my position to the right hand or to the left, other streams of light enter my eye, and produce the same effect. As

me now attend to another circumstance, no less admirable than the preceding, and that is, the *distinct impression* which I have of the shape, colour, and motion, of the multiplicity of objects I am now contemplating, and the *small space* within which their images are depicted at the bottom of my eye. Could a painter, after a long series of ingenious efforts, delineate the extensive landscape now before me, on a piece of paper not exceeding the size of a silver sixpence, so that every object might be distinctly seen, in its proper shape and colour, as it now appears when I survey the scene around me, he would be incomparably superior to all the masters of his art that ever went before him. This effect, which far transcends the utmost efforts of human genius, is accomplished in a moment, in millions of instances, by the hand of nature, or, in other words, by "the finger of God." All the objects I am now surveying, comprehending an extent of a thousand square miles, are accurately delineated in the bottom of my eye, on a space *less than half an inch* in diameter. How delicate, then, must be the strokes of that Divine pencil, which has formed such a picture! I turn my eyes to the castle of Edinburgh, which appears one of the most conspicuous objects in my field of view. Supposing that portion of it which strikes my eye to be 500 feet long, and 90 in height, I find, by calculation, that it occupies only the six hundred thousandth part of the whole landscape, and, consequently, fills in my eye no more than the twelve hundred thousandth part of an inch. I next direct my eye towards the Frith of Forth, and perceive a steamboat sailing between Queensferry and Newhaven,—I distinctly trace its motion for the space of 40 minutes, at the end of which it reaches the chain pier at Newhaven, having passed over a space of five miles in length, which is but the eighth part of the *lineal* extent of the landscape in that direction; and, consequently, occupies, in the picture formed on my retina, a lineal space of only one-sixteenth of an inch in extent. And, if the boat be reckoned about 88 feet in length, its image is only the three hundredth part of this extent; and of course, fills a space in the eye of only the four thousand eight hundredth part of a *lineal* inch. Yet, my perception of the motion of the vessel could be produced only by a corresponding motion of its image in my eye; that is, by the *gradual* motion of a point one 4,800th of an inch in diameter, over a space one-sixteenth of an inch in length. How inconceivably fine and accurate, then, must be the impression of those strokes which the rays of light, from visible objects, produce on the retina of the eye! The mind is lost in wonder when it attempts to trace so exquisite and admirable an effect.

I take a reflecting telescope, and, through it, view some of the distant parts of the landscape. My wonder is still increased, when I consider the new direction into which the rays of light are

bent—the crossings and recrossings, and refractions, and reflections, that take place between the mirrors and the lenses of the instrument, and the successive images that are formed—so that, instead of a scene of confusion, which, previous to experience, might have been expected from the numerous additional bendings and intersections of the rays—I now perceive hundreds of objects, with the most perfect distinctness, which were before invisible. Rays of light from distant and minute objects, which a moment before made no sensible impression on my eye, being collected and variously modified by the telescope, now paint a vivid representation of their objects, in their true figures, colours, and positions.

From a consideration of the innumerable modifications of the rays of light, and of the immense variety of effects they produce in every region of the earth—I am led to investigate *what proportion of the solar light falls upon our globe*, in order to produce so diversified a scene of sublimity and beauty. Supposing the sun's rays to be chiefly confined, in their effects, within the limits of the planetary system, since they diverge in every direction, they must fill a cubical space of 3,600,000,000 miles in diameter; which, consequently, will contain about 24,000,000,000,000,000,000,000,000 cubical miles; so that an eye, placed in any point of this vast space, would receive a distinct impression from the solar rays. The solidity of the earth is about 264,000,000,000 cubical miles, and, therefore, it receives only the  $\frac{1}{90,000,000,000,000,000}$ th part of the light which fills the sphere of the solar system. So that the light which cheers all the inhabitants of the world, and unveils such a variety of beautiful and magnificent objects, is nothing more than a *single stream* of celestial radiance out of ninety thousand billions of similar streams which the great source of light is every moment diffusing throughout the surrounding worlds. But the solar rays are not confined within the bounds of the planetary system; their influence extends, in every direction, as far as the nearest stars, filling a cubical space at least 40,000,000,000,000 miles in diameter, and which contains 33,500,000,000,000,000,000,000,000,000,000,000,000,000,000, or thirty-three thousand, five hundred sextillions of cubical miles. And, were we to institute comparisons and calculations, with respect to the possible variety of effects they might produce throughout this immense region, whole pages might be filled with figures, cyphers, and computations. We might compute how many globes similar to the earth, or any of the larger planets, might be contained within this vast space, allowing several hundreds of cubical miles of empty space around each globe—how many myriads of refractions and reflections the rays of light would suffer, in regard to the peculiar objects connected with every one

of these globes—how many eyes of sentient beings might be affected by the diversities of colour, shape, and motion, which would thus be produced—and what a variety of shades of light and colour, and what a diversity of scenery, would be produced, according to the distances of the respective globes from the central luminary. After what we have just now stated, however, we may rest satisfied with joining in the pious exclamation of one who had just finished a devout survey of the structure of the human frame: “Marvellous are thy works, and that my soul knoweth right well. How precious are thy thoughts unto me, O God!” (or, as the words might be rendered,) “How precious are thy wonderful contrivances concerning me, O God! how great is the sum of them! If I should count them, they are more in number than the sand.” In what direction soever I turn mine eyes, whatever portion of thy works I investigate, “*I am still with thee.*”<sup>\*</sup> Thine infinity and unsearchable wisdom are impressed on every object, so that I feel myself every moment encompassed by thine immensity, and am irresistibly led to wonder and adore.

I shall now conclude these reflections on vision, with two or three additional remarks. It is worthy of notice, in the first place, that the eye has the power of adapting itself to objects placed at different distances. By means of some delicate pieces of mechanism, not hitherto satisfactorily explained, it can perceive, with distinctness, a large object, at the distance of six miles, and the next moment it can adjust itself to the distinct perception of an object at the distance of six inches; so that it acts the part both of a telescope and a microscope, and can be instantaneously adjusted to perform either as the one instrument or as the other. This necessarily supposes a corresponding alteration in the state of the organ, every time we lift our eye from a near, to look at a distant object. Either the cornea is somewhat flattened, or the crystalline humour is pushed backwards, or both these changes, in combination with others, may concur in causing the rays from distant objects to unite exactly on the retina, without which distinct vision cannot be produced. This contrivance, in whatever kind of mechanism it may consist, is one which art would vainly attempt to imitate. We can see objects that are near us, with a microscope, and those that are distant, with a telescope; but we would in vain attempt to see distant objects with the former, or those that are only a few inches from us with the latter, without a variety of changes being made in the apertures and positions of the glasses belonging to the respective instruments. In this respect, therefore, as well as in every other, the eye is an optical instrument, incomparably superior to any

instrument or imitation that art can produce. and, were it not for the peculiar property now described, it would be almost unfit for the purpose of vision, notwithstanding all the other delicate contrivances which enter into its construction. If it were adjusted only for the distinct perception of distant objects, every object within the limits of an ordinary apartment would appear a mass of confusion; and were it adjusted solely for viewing objects within the limits of a few feet or inches, the glories of the heavens, and the beautiful landscape of the earth, would be veiled from our sight as if they were enveloped in a mist.

Another circumstance worthy of attention, is, the power which the pupil of the eye possesses of contracting or enlarging the aperture or hole through which the light is admitted. When the light is too weak, the pupil is enlarged; when it is too strong, it is again contracted. Accordingly, we find, that when we enter a darksome apartment, though, at first, nothing can be accurately distinguished, yet, in the course of a minute or two, when the pupil has had time to dilate, we can perceive most objects with considerable distinctness. And, on the other hand, when we pass from a dark room to an apartment lighted up with a number of lustres, we feel uneasy at the sudden glare, till the pupil has contracted itself, and excluded a portion of the superfluous rays. Were it not for this property, we should for the most part either be surrounded with a disagreeable gloom or oppressed with an excessive splendour. It is for this reason, that we are unable to look upon the sun without being dazzled, and are under the necessity of closing the eyelids, or of turning away the head, when a strong light suddenly succeeds to darkness.

Again, it may not be improper to observe, how wisely the Author of nature has fixed the distance at which we ordinarily see near objects most distinctly. This distance is generally from five to eight inches from the eye. But had the eye been formed for distinct vision at the distance of only one inch, the object would have obstructed the light, and room would have been wanting for the performance of many necessary operations, which require the hand to intervene between the eye and the object. And had the limits of distinct vision for near objects been beyond two or three feet, sufficient light would not have been afforded for the inspection of minute objects, and we could neither have written a letter, nor have read a book, with the same convenience and ease we are now enabled to do.

From the preceding descriptions and remarks, it will evidently appear, with what admirable skill the different parts of the organs of vision are constructed, and how nicely they are adapted to the several ends they were intended to subserve. Were any one of these parts wanting, or obstructed in its functions, vision would either be impeded, or rendered painful and distressing, or

<sup>\*</sup> Psalm cxxxix. 14, 17, 18.

completely destroyed. If any of the humours of the eye were wanting—if they were less transparent—if they were of a different refractive power—or if they were of a greater or less convexity than they now are, however minute the alteration might be, vision would inevitably be obstructed, and every object would appear confused and indistinct. If the retina, on which the images of objects are painted, were flat, instead of being concave, while objects in the middle of the view appeared distinct, every object towards the sides would appear dim and confused. If the cornea were as opaque as the sclerotica, to which it is joined, or if the retina were not connected with the optic nerve, no visible object could possibly be perceived. If one of the six muscles of the eye were wanting, or impeded in its functions, we could not turn it to the right; if a second were deficient, we could not turn it to the left; if a third, we could not lift it upwards; if a fourth, we could not move it downwards; and if it were deprived of the other two muscles, it would be apt to roll about in frightful contortions. If the eyes were placed in any other part of the body than the head—if they were much more prominent than they now are—if they were not surrounded by the bony socket in which they are lodged—and if they were not frequently covered by the eyelid—they would be exposed to a thousand accidents from which they are now protected. If they wanted moisture, and if they were not frequently wiped by the eyelids, they would become less transparent, and more liable to be inflamed; and if they were not sheltered by the eyebrows, the sweat and moisture of the forehead would frequently annoy them. Were the light which acts upon them devoid of colour—were it not reflected from objects in every direction—were its motion less swift, or its particles much larger than they now are—in short, were any one circumstance connected with the structure of this organ, and with the modification of the rays of light, materially different from its present arrangement, we should either be subjected to the hourly recurrence of a thousand painful sensations, or be altogether deprived of the entertainments of vision.

How admirable an organ, then, is the eye, and how nicely adapted to unveil to our view the glories of the universe! Without the application of any skill or laborious efforts, on our part, it turns in every direction, transports us to every surrounding object, depicts the nicest shades and colours on its delicate membranes, and

"Takes in, at once, the landscape of the world,  
At a small inlet, which a grain might close,  
And half creates the wondrous world we see."  
Young.

—How strikingly does it display, in every part of its structure and adaptations, the marks of benevolent design, and of Infinite Intelligence! However common it is to open our eyes, and to

behold, in an instant, the beauties of an extensive landscape, and however little we may be accustomed to admire this wonderful effect,—there is not a doctrine in Religion, nor a fact recorded in Revelation, more mysterious and incomprehensible. An excellent French writer has well observed—"The sight of a tree and of the sun, which God shows me, is as real and as immediate a revelation as that which led Moses towards the burning bush. The only difference between both these actions of God on Moses and me, is, that the first is out of the common order and economy; whereas the other is occasioned by the sequel and connexion of those laws which God has established for the regulation both of man and nature."

If, then, the eye of man (who is a depraved inhabitant of a world lying partly in ruins) is an organ so admirably fitted for extending our prospects of the visible creation—we may reasonably conclude, that organized beings, of superior intelligence and moral purity, possess the sense of vision in a much greater degree of perfection than man, in his present state of degradation—and that they may be enabled, by their natural organs, to penetrate into regions of the universe far beyond what man, by the aid of artificial helps, will ever be able to descry. It may not be altogether extravagant, nor even beyond the reality of existing facts, to suppose, that there are intelligences in the regions of Jupiter or Saturn, whose visual organs are in so perfect a state, that they can descry the mountains of our moon, and the continents, islands, and oceans which diversify our globe, and are able to delineate a map of its surface, to mark the period of its diurnal rotation, and even to distinguish its cities, rivers, and volcanoes. It is quite evident, that it must be equally easy to Divine Wisdom and Omnipotence, to form organs with powers of vision far surpassing what I have now supposed, as to form an organ in which the magnificent scene of heaven and earth is depicted, in a moment, within the compass of half an inch. There are animals whose range of vision is circumscribed within the limits of a few feet or inches; and, had we never perceived objects through an organ in the same state of perfection as that with which we are furnished, we could have formed as little conception of the sublimity and extent of our present range of sight, as we can now do of those powers of vision, which would enable us to descry the inhabitants of distant worlds. The invention of the telescope shows, that the penetrating power of the eye may be indefinitely increased; and since the art of man can extend the limits of natural vision, it is easy to conceive, that, in the hand of Omnipotence, a slight modification of the human eye might enable it, with the utmost distinctness, to penetrate into regions to which the imagination can set no bounds. And, therefore,

It is not unreasonable to believe, that, in the future world, this will be one property, among others, of the resurrection-body, that it will be furnished with organs of vision far superior to the present, in order to qualify its intelligent inhabitant for taking an ample survey of the "riches and glory" of the empire of God.

I have dwelt somewhat particularly on the functions of the eye, in order to show, that it is only when we take a minute inspection of the operations of the Creator, that his Infinite Wisdom and Intelligence are most distinctly perceived. The greater part of Christians will readily admit that the Wisdom of God is manifested in every object, but few of them take the trouble to inquire in *what particular contrivances and adaptations* this wisdom is displayed; and, therefore, rest satisfied with vague and general views, which seldom produce any deep impression on the mind. "The works of the Lord," which are "great" and admirable, "must be sought out by all those who have pleasure therein;" and the more minutely they are inspected, the more exquisite and admirable do all his arrangements appear.

Were we to enter into an investigation of the *visual organs of the lower animals*, and to consider the numerous varieties which occur in their structure, position, and movements, and how nicely the peculiar organization of the eye is adapted to the general structure of the animal, and to its various necessities and modes of existence—the operation of the same inscrutable Wisdom and Intelligence would meet our eye at every step. *Birds*, for example, which procure their food by their beak, have the power of seeing distinctly at a very small distance; and, as their rapid motion through the air renders it necessary that they should descry objects at a considerable distance, they have two peculiar mechanical contrivances, connected with their organs of vision, for producing both these effects. One of these contrivances consists in a flexible rim formed of bone, which surrounds the broadest part of the eye, and by occasionally pressing upon its orb, shortens its focal distance, and thus enables it to inspect very near objects. The other consists of a peculiar muscle, which draws back, as occasion requires, the crystalline humour, by which means it can take a distinct view of a distant landscape; and can pass from the sight of a very near, to the sight of a distant object, with rapidity and ease. In *fishes*, which live in a medium of a different refractive power from that of air, the crystalline humour has a greater degree of convexity, and more nearly approaches to a globular form than that of land animals—which conformation is essentially requisite to distinctness of vision in the watery element. A fish of course cannot see distinctly in air, nor a quadruped under water; and every person who has dived into the water with his eyes open, knows, that

though he may perceive the general forms and colours of objects, his vision is obscure and indistinct. In *hares* and *rabbits* the eyes are very convex and prominent, so that they can see nearly quite round them; whereas, in *dogs*, which pursue these animals, the visual organs are placed more in the front of the head, to look rather before than behind them. Some animals, as *cats* and *owls* which pursue their prey in the dark, have the pupil of their eye so formed as to be capable of great expansion, so that a few rays of light may make a lively impression on their retina; while the *eagle*, which is able to look directly at the sun, has its pupil capable of being contracted almost to a point. Insects, such as the *beetle*, the *fly*, and the *butterfly*, whose eyes are incapable of motion, have several thousands of small transparent globes set in a convex hemisphere, every one of which is capable of forming an image of an object; so that they are enabled to view the objects around them without moving their heads. But, it would be beyond the limits of my plan to prosecute this subject any farther; enough has already been stated, to show, that the eyes of men and other animals are master-pieces of art, which far transcend the human understanding; and that they demonstrate the consummate wisdom of Him who planned and constructed the organical functions of the various tribes of animated existence.

I shall now conclude this branch of my subject, by presenting an instance or two of the mechanism of the bones, and the movements it is fitted to produce.

The bones of the human frame are articulated, or connected together, in different ways, but most frequently in the following manner. Either, 1. a bone with a round head is articulated with a cavity, and plays in it as a ball in a socket; or, 2. they are connected together by a hinge-like articulation, which enables a bone to move up or down, backwards or forwards, like a door upon its hinges. An idea of these two motions, and the purposes they serve, may be obtained, by considering the construction of the pedestal of a telescope, and the joints on which it moves. One of the joints is of the nature of a hinge, by which a vertical motion, or a motion upwards and downwards is produced. A horizontal motion, or a motion towards the right hand or the left, is produced by a pivot moving in a socket; so that, by these two motions, the telescope can be made to point in any direction. Such is the nature of the articulations of the bones, and the movements they produce; and wherever one or other of these motions, or both of them combined, are requisite for the comfort and convenience of the individual, such a power of motion is uniformly found to exist. If the movement of a joint in every direction would, in any particular case, be found inconvenient, the hinge-like articulation is fixed upon; but if a motion in every direction is

required for the convenient use of particular members, and for the variety of evolutions which a sentient being may have occasion to make, the ball and socket articulation is combined with the former.

For example, let any person, for a moment, consider the joints of his fingers, and compare them with the joint at his wrist, where the hand is connected with the fore arm. If he hold the back of his hand upwards, he will find that he can move his fingers upwards, or downwards; but he cannot turn them to the right hand, or to the left, so as to make them describe a circular motion. He will also find that his wrist is capable of a similar movement, so that the hand may be bent in a vertical direction. But, in addition to this motion, it is also capable of being turned in a horizontal direction, or from one side to another. In the former case, we have an example of the hinge articulation; in the latter, it is combined with an articulation which produces nearly the same effect as a pivot moving in a socket. Now, had the joints of the fingers been capable of the same motions as the wrist, the hand would have lost its firmness, and been incapable of performing a variety of mechanical operations which require objects to be held with a steady grasp. On the other hand, if the joint of the wrist had been formed in the same manner as the joints of the fingers, and confined to a vertical motion, the hand would have been incapable of one out of a hundred varied movements, which it can now perform with the greatest ease. In this case, we could not have bored a hole with a gimlet, cut down corn with a sickle, digged the earth with a spade, sewed clothes with a needle, tossed up a ball, or turned up the palm of the hand, for any of the useful purposes for which that motion was ordained. In short, without the rotatory motion of the wrist, the greater part of the operations connected with gardening, agriculture, cookery, washing, spinning, weaving, painting, carving, engraving, building, and other mechanical arts, could not be performed; and such of them as could be effected, would be accomplished only with the greatest inconvenience and labour. Any person may convince himself of this, by holding his hand in a horizontal position, and preventing his wrist joint from turning round, and then by trying what operations he can easily perform without the rotatory motion; and he will soon perceive with what exquisite skill the numerous movements of our animal frames have been contrived by the great Author of our existence. In each hand there are 27 bones, all of which are essential to the different motions we wish to perform. Every finger is composed of three bones, connected together by articulations, muscles, and ligaments. If, instead of three, each finger were composed of only one bone, it would be quite impossible for us to grasp a single object.

The same admirable contrivance may be perceived in the movements of which the head is susceptible. It was requisite, in order to our convenience and comfort, that we should be enabled to move our head backwards or forwards—to look up towards the heavens, or downwards to the ground. It was also expedient, that it should have a power of turning to the right, or to the left, so as to take in a considerable portion of a circle, without being under the necessity of turning round the whole body. Accordingly we find, that both these motions are provided for, in the manner in which the head is connected with the *vertebræ*. The head rests upon the uppermost of these bones, to which it is connected by a hinge joint, similar to those in the fingers, which allows it to move backwards and forwards; and, by means of a round, longish process, or projection, which moves in a socket, it is enabled to move horizontally, as upon an axis. Had the first motion been wanting, we could not have looked up to the zenith, without laying flat on our back; nor could we have looked to the ground, without placing our bodies in a prone position, and, in such a case, we could never have seen our own feet, unless when they were bent considerably forward. Had the second motion been wanting, we could have looked to nothing except the objects directly before us, without the trouble of turning round the whole body, either to the right, or to the left. But in the construction of our corporeal system, every thing is so arranged and adapted to another, as at once to contribute to ease, and facility of motion, in all the varied operations and movements we have occasion to perform; which circumstance forcibly demonstrates both the benevolent intentions, and the admirable wisdom of Him “whose hands have made and fashioned us,” and who “breathed into our nostrils the breath of life.”

The above are only two or three out of a hundred of similar instances, which might be produced to show the benevolent care which has been exercised in arranging and articulating the system of bones, of which the prop-work of the human frame is composed. Were we to enter into an investigation of the actions and uses of the various muscles, the wonderful system of veins and arteries, the action of the heart, stomach, and bowels; the process of respiration, and insensible perspiration, and the system of nerves, glands, lymphatics, and lacteals—a thousand instances of Divine wisdom and beneficence would crowd upon our view, which could not fail to excite the pious and contemplative mind to join in the devotions of the “sweet singer of Israel,” “I will praise thee; for I am fearfully and wonderfully made; marvellous are thy works, and that my soul knoweth right well.”—But as I intended to present only a few specimens of the Wisdom of God, as displayed in the construction of

the material world, I shall conclude this department of my subject with a single reflection.\*

*How foolish and ungrateful is it for rational beings to overlook the wise and benevolent arrangements of the Creator, in the material universe !* How many thousands of human beings pass their existence without once reflecting on the numerous evidences of Divine Wisdom and Beneficence, which appear around them, or feeling the least spark of gratitude for their preservation and comforts, to that Being "in whose hand their breath is, and whose are all their ways !" Yea, how many are there who consider themselves as standing high in the ranks of the Christian profession, who affect to look down, with a certain degree of contempt, on the study of the material works of God, as if it were too gross a subject for their spiritual attainments ! They profess to trace the wisdom of God in the Scriptures, and to feel gratitude for his pardoning mercy ; but they seldom feel that gratitude which they ought to do for those admirable arrangements in their own bodies, and the elements around them, by which their lives are preserved, and their happiness promoted ; and even seem to insinuate, that they have little or nothing to do with the contrivances of the God of Nature. They leave it to the genius of infidel philosophers to trace the articulations of the bones, the branchings of the veins and arteries, the properties of light, and the composition of the atmosphere, while they profess to feast their minds on more sublime and spiritual entertainments. But, surely, such astonishing displays of the wisdom and benignity of the Most High, as creation exhibits, were never intended to be treated by his intelligent offspring with apathy or indifference ; and to do so, must indicate a certain degree of ingratitude towards Him whose incessant energy sustains the whole assemblage of sentient and intelligent beings, and who displays himself, in their construction and preservation, to be "wonderful in counsel, and excellent in working." Shall we imagine, that, because God stands in the gracious relation of our Redeemer, he has ceased to stand in the relation of our Creator and Preserver ? Or shall we consider those subjects as unworthy of our attention, which are the theme of the praises of the heavenly host ? Rev. iv. 11. Can we suppose that the Almighty displayed his infinite wisdom in the curious organization of the human eye, that man—the only being in this world who is endowed with faculties capable of appreciating

its structure, and for whose use and entertainment it was intended—should overlook such a wonderful piece of Divine workmanship, and feel not gratitude for the bestowment of so admirable a gift ? Shall we extol the ingenuity displayed in a clock or a watch, in a chess-player, or a steam engine, and shall we feel no sentiment of admiration at the view of millions of instances of Divine mechanism which infinitely transcend the powers of the human understanding ? To act in this manner, as too many are disposed to do, is unworthy of man, both as a Christian and as an intelligent agent. Such was not the conduct of the inspired writers ; their spirituality of views did not lead them to neglect the contemplation of any of the works of God. "I will meditate on all thy works," says the Psalmist, "and talk of all thy doings ; I will utter abundantly the memory of thy great goodness, and speak of thy wondrous works." Accordingly we find, that the wonders of the human frame, the economy of the animal and the vegetable tribes, the scenery of the "dry land," and of the "mighty deep," and the glories of the heavens, were the frequent subjects of their devout contemplation. They consider them in relation to the unceasing agency of God, by whom they were formed and arranged, and as declaring his Wisdom, Goodness, and Omnipotence : and, with this view, ought all the scenes of the visible creation to be investigated by his intelligent creatures.

We have reason to believe, that it is owing, in part, to want of attention to the Divine wisdom and beneficence, as exhibited in the construction of the visible world, that many professed Christians entertain so vague and confused ideas respecting the wisdom and goodness of Deity, as displayed in the economy of Redemption. The terms, Wisdom, Goodness, and Beneficence, in their mouths, become words almost without meaning, to which no precise or definite ideas are attached ; because they have never considered the instances and the evidence of these attributes, displayed in the material creation. And, if our minds have not been impressed with a sense of the wisdom and beneficence of God, in those objects which are presented to the external senses, we cannot be supposed to have luminous and distinct ideas of those spiritual objects and arrangements which are removed beyond the sphere of our corporeal organs. For all our ideas, in relation to Religion and its objects, are primarily derived from the intimations we receive of external objects, through the medium of our senses ; and, consequently, the more clearly we perceive the agency of God, in his visible operations, the more shall we be qualified to perceive the wisdom and harmony of his dispensations, as recorded in the volume of inspiration.

We live in a world, all the arrangements of which are the effects of infinite Wisdom.

\* Those who wish to prosecute this subject, particularly that part of it which relates to the contrivances of Divine Wisdom, which appear in the animal system, will find ample gratification in Nieuwentyt's "Religious Philosopher," Vol. 1, and Dr. Paley's "Natural Theology." A variety of useful remarks on this subject will also be found in Ray's "Wisdom of God in the Creation," Derham's "Physico-Theology," and Bonnet's "Contemplation of Nature."

are surrounded with wonders on every hand ; and therefore we cease to admire, or to fix our attention on any one of the wonders daily performed by God. We have never been accustomed to contemplate or to inhabit a world where benevolence and wisdom are not displayed ; and, therefore, we are apt to imagine, that the circumstances of our terrestrial existence could not have been much otherwise than they actually are. We behold the sun in the morning, ascending from the east—a thousand shining globes are seen in the canopy of the sky, when he has disappeared in the west. We open our eyelids, and the myriad of objects which compose an extensive landscape are, in a moment, painted on our retina,—we wish to move our bodies, and, in an instant, the joints and muscles of our hands and feet perform their several functions. We spread out our wet clothes to dry, and in a few hours the moisture is evaporated. We behold the fields drenched with rain, and in a few days it disappears, and is dispersed through the surrounding atmosphere, to be again imbodied into clouds. These are all common operations, and, therefore, thoughtless and ungrateful man seldom considers the obligations he is under to the Author of his existence, for the numerous enjoyments which flow from these wise arrangements. But were the globe we inhabit, and all its appendages, to remain in their present state—and were only the principle of *evaporation* and the *refractive and reflective properties of the air* to be destroyed—we should soon feel, by the universal gloom which would ensue, and by a thousand other inconveniences we should suffer, what a miserable world was allotted for our abode. We should most sensibly perceive the wisdom and goodness we had formerly overlooked, and would most ardently implore the restoration of those arrangements for which we were never sufficiently grateful. And why should we not *now*—while we enjoy so many comforts flowing from the plans of infinite Wisdom—have our attention directed to the benevolent contrivances within us, and around us, in order that grateful emotions may be hourly arising in our hearts, to the Father of our spirits ? For the essence of true religion consists chiefly in *gratitude* to the God of our life, and the Author of salvation ; and every pleasing sensation we feel from the harmonies and the beauties of nature, ought to inspire us with this sacred emotion. “Hearken into this, O man ! stand still, and consider the wonderful works of God. Contemplate the balancings of the clouds, the wondrous works of Him who is perfect in knowledge.”—“He hath made the earth by his power, he hath established the world by his wisdom. When he uttereth his voice, there is a noise of waters in the heavens ; he causeth the vapours to ascend from the ends of the earth, and bringeth the winds out of his treasures.” While it is shameful for

man to be inattentive to the wonders which surround him, what can be more pleasing and congenial to a rational and devout mind, than contemplations on the works of the Most High ? “What can be more gratifying,” says Sturm “than to contemplate, in the heavens, in the earth, in the water, in the night and day, and indeed, throughout all nature, the proofs which they afford of the wisdom, the purity, and the goodness of our great Creator and Preserver ! What can be more delightful than to recognize, in the whole creation, in all the natural world, in every thing we see, traces of the ever-working providence and tender mercy of the great Father of all !”

---

#### SECTION IV.

##### *On the Goodness or Benevolence of the DEITY.*

THE Benevolence of God is that perfection of his nature, by which he communicates happiness to the various ranks of sensitive and intelligent existence.

The system of Nature, in all its parts, exhibits an unbounded display of this attribute of the Divine Mind, both in relation to man, and in relation to the subordinate tribes of animated existence. In relation to *Man*—the magnificence and glory of the heavens—the variegated colouring which is spread over the scene of nature—the beautiful flowers, shrubs, and trees, with which the earth is adorned, which not only delight the eye, but perfume the air with their delicious odours—the various kinds of agreeable sounds that charm the ear—the music of the feathered songsters, which fill the groves with their melody—the thousands of pleasant images which delight the eye, in the natural embellishments of creation—the agreeable feelings produced by the contact of almost every thing we have occasion to touch—the pleasure attached to eating, drinking, muscular motion, and activity—the luxuriant profusion, and rich variety of aliments which the earth affords—and the interchanges of thought and affection—all proclaim the Benevolence of our Almighty Maker, and show that the communication of happiness is one grand object of all his arrangements. For these circumstances are not *essentially* requisite to our existence. We might have lived, and breathed, and walked though every thing we touched had produced pain ; though every thing we ate and drank had been bitter ; though every movement of our hands and feet had been accompanied with uneasiness and fatigue ; though every sound had been as harsh as the saw of the carpenter ; though no birds had warbled in the groves ; though no flowers had decked the fields, or filled the air with their per-

fumes; though one unvaried scene of dull uniformity had prevailed, and beauty and sublimity had been swept from the face of nature; though the earth had been covered with a mantle of black, and no radiant orbs had appeared in our nocturnal sky. But what a miserable world should we then have inhabited, compared with that which we now possess! Life would have passed away without enjoyment; and pain would have overbalanced the pleasure of existence. Whereas, in the existing constitution of things, all the objects around us, and every sense of which we are possessed, when preserved in its natural vigour, have a direct tendency to produce pleasing sensations, and to contribute to our enjoyment: and it is chiefly when we indulge in foolish and depraved passions, and commit immoral actions, that the benevolent intentions of the Deity are frustrated, and pain and misery produced.

If we consider, further, that the inexhaustible bounty of the Creator, and the numerous pleasures we enjoy, are bestowed upon a guilty race of men, the benevolence of the Deity will appear in a still more striking point of view. Man has dared to rebel against his Maker; he is a depraved and ungrateful creature. The great majority of our race have banished God from their thoughts, trampled upon his laws, neglected to contemplate his works, refused to pay him that tribute of reverence and adoration which his perfections demand, have been ungrateful for his favours, have blasphemed his name, and have transferred to "four-footed beasts, and creeping things," that homage which is due to him alone. It has been the chief part of their employment, in all ages, to counteract the effects of his Beneficence, by inflicting injustice, oppression, and torture, upon each other; by maiming the human frame, burning cities and villages, turning fruitful fields into a wilderness, and by every other act of violence, carrying death and destruction through the world. And if water, air, and the light of heaven, had been placed within the limits of their control, it is more than probable, that whole nations would have been occasionally deprived of these elements, so essential to human existence. Yet, notwithstanding the prevalence of such depraved dispositions, the streams of Divine benevolence towards our apostate race have never yet been interrupted. The earth has never stopped in its career, and thrown nature into a scene of confusion; the light of heaven has never ceased to illumine the world; the springs of water have never been dried up, nor has the fertile soil ceased to enrich the plains with golden harvests. God "hath not left himself without a witness," to his beneficence, in any age, in that he hath unceasingly bestowed on the inhabitants of the world "rain from heaven, and fruitful seasons, filling their hearts with food and gladness." This is one of the characters of Deity which forms the

most perfect contrast to the selfish and revengeful dispositions of man, which as far transcends human benevolence, as the heavens in extent surpass the earth—a character calculated to excite our highest love and admiration, and which we are called upon, in the Sacred Oracles, to imitate and revere. "Be ye merciful, as your Father who is in heaven is merciful: for he maketh his sun to rise on the evil and on the good, and sendeth rain on the just and on the unjust."—"O that men would praise the Lord for his goodness, and for his wonderful works to the children of men."

From such considerations, we learn, even from the system of nature, that mercy is an attribute of the Deity; for, if mercy consists in bestowing favours on those who are unworthy, or who merit punishment, the greatest sinners in all ages have shared in it, and every individual of the human race now existing enjoys a certain portion of those comforts which flow from the benevolent arrangements which the Creator has established. "He maketh the sun to rise on the evil and on the good." Though the nations in ancient times, as well as at present, "walked in their own way," indulging in impiety, falsehood, lewdness, war, devastations, revenge, abominable idolatries, and every other violation of his law, he still supported the functions of their animal frames, and caused the influence of the sun, the rains, and the dews, to descend upon their fields, that they might be refreshed with his bounty, and filled "with food and gladness." If mercy were not an essential attribute of the Deity, he would have cut them down in the midst of their first transgressions, shattered to pieces the globe on which they dwelt, and buried them in eternal oblivion. But whether Divine mercy will extend to the final forgiveness of sin, and the communication of eternal happiness to such beings, can be learned only from the discoveries of revelation.

In relation to the inferior animals—the immense multitude of living creatures with which the earth is replenished, is a striking evidence of the vast profusion of Divine Beneficence. More than a hundred thousand species of animated beings are dispersed through the different regions of the air, the water, and the earth, besides myriads which are invisible to the unassisted eye. To estimate the number of individuals belonging to any one species is beyond the power of man. What countless myriads of herrings, for example, are contained in a single shoal, which is frequently more than six miles long and three miles broad. To estimate the number of individuals in all the different species would, therefore, be as impossible as to count the grains of sand in the Arabian deserts. There is not a single spot, in any region of the globe, but what teems with animated beings. Yet, all this vast assemblage of sensitive existence is

amply provided for by the bountiful Creator. "These all wait upon him, and he giveth them their meat in due season." They enjoy not only life, but also a *happy* existence. The sportive motions and gesticulations of all the animal tribes—the birds skimming through the air, warbling in the groves, and perching on the trees—the beasts of the field, bounding in the forests, and through the lawns—the fishes sporting in the waters—the reptiles wriggling in the dust, and the winged insects, by a thousand wanton mazes—all declare that they are rejoicing in their existence, and in the exercise of those powers with which the Creator has furnished them. So that, wherever we turn our eyes, we evidently perceive, that "the earth is full of the goodness of the Lord;" and that "his tender mercies are over all his works." This subject is boundless—but it would be inconsistent with the limited plan of this work, to enter into any particular details. And it is the less necessary, when we consider, that every instance of Divine Wisdom is, at the same time, an instance of *benevolence*; for it is the ultimate object of all the wise contrivances in the system of Nature, that happiness may be communicated to the various ranks of sensitive and intelligent existence. *Goodness* chooses the *end*, and *wisdom* selects the most proper *means*, for its accomplishment; so that these two attributes must always be considered in simultaneous operation. And, therefore, the instances I have already specified, of the Wisdom and Intelligence of the Creator, may also be considered, as exemplifications of Divine Benevolence. I shall, therefore, conclude this topic with the following extract from Dr. Paley.

"Contrivance proves design; and the prominent tendency of the contrivance, indicates the disposition of the designer. The world abounds with contrivances; and all the contrivances we are acquainted with, are directed to beneficial purposes. Evil, no doubt, exists; but it is never that we can perceive, the object of contrivance. Teeth are contrived to eat, not to ache; their aching now and then, is incidental to the contrivance, perhaps inseparable from it; or even, if you will, let it be called a defect in the contrivance, but it is not the *object* of it. This is a distinction which well deserves to be attended to. In describing implements of husbandry, you will hardly say of a sickle, that it is made to cut the reaper's fingers, though from the construction of the instrument, and the manner of using it, this mischief often happens. But if you had occasion to describe instruments of torture or execution, This, you would say, is to extend the sinews; this to dislocate the joints; this to break the bones; this to scorch the soles of the feet. Here pain and misery are the very *objects* of the contrivance. Now nothing of this sort is to be found in the works of nature. We never dis-

cover a train of contrivance to bring about an evil purpose. No anatomist ever discovered a system of organization calculated to produce pain and disease; or in explaining the parts of the human body, ever said, This is to irritate; this to inflame; this duct is to convey the gravel to the kidneys; this gland to secrete the humour which forms the gout. If, by chance, he come at a part of which he knows not the use, the most he can say is, that it is useless; no one ever suspects that it is put there to incommode, to annoy, or torment. Since, then, God hath called forth his consummate wisdom to contrive and provide for our happiness, and the world appears to have been constituted with this design at first, so long as this constitution is upheld by him, we must, in reason, suppose the same design to continue."—*Paley's Moral Philosophy, Book II. Chap. 5.*

Thus, I have endeavoured, in this and the preceding section, to exhibit a few specimens of the Wisdom and Goodness of God, in the system of nature. These might have been multiplied to an indefinite extent, but the instances adduced, I presume, are sufficient to show, that the economy of the material world is not altogether a barren subject, to a pious and contemplative mind. Every intelligent believer in Revelation will readily admit, that it would be a highly desirable object, to induce upon the mass of Christians such a habit of devout attention to the visible works of creation, as would lead them, in their social and solitary walks, to recognize the agency of God, in every object they behold; to raise their thoughts to Him as the Great First Cause, and to expand their hearts with emotions of gratitude. How very different must be the sentiments and the piety of the man who looks on the scene of wisdom and magnificence around him, with a "brute unconscious gaze," as thousands of professed Christians do—and the grateful and pious emotions of him who recognizes the benevolent agency of God, in the motions of his fingers, and his eyeballs; in the pulsation of his heart; in the picture of external objects every moment formed on his retina; in the reflection of the rays of light, and the diversified colours they produce; in the drying of his clothes; in the constitution of the atmosphere; in the beauty and magnificence of the earth and the heavens; and in every other object that meets his eye, in the expanse of nature! The numberless astonishing instances of Divine agency, which every where present themselves to our view in the scene around us, seem evidently intended to arrest the mind to a consideration of an "ever-present Deity;" and I envy not the sentiments or the feelings of that man who imagines, that he stands in no need of such sensible mediums, to impress his mind with a sense of the benevolent care and *omnipresence* of God.

## CHAPTER II

### CONTAINING A CURSORY VIEW\* OF SOME OF THE SCIENCES WHICH ARE RELATED TO RELIGION AND CHRISTIAN THEOLOGY.

**THEOLOGY** has generally been viewed as a study of a very limited range : and, hence, when it has been admitted into the circle of the sciences, a much smaller space has been allotted for its discussion, than has been devoted to almost any other department of human knowledge. When considered, however, in its most extensive sense,—in its relations to the Divine Being—to his past and present dispensations towards the human race—to the present circumstances and the future destiny of man—and to the physical and moral condition of all the sentient and intelligent beings of which we have any intimation—it ought to be viewed as the most varied and comprehensive of all the sciences ; as embracing, within its extensive grasp, all the other departments of useful knowledge, both human and divine. As it has God for its object, it must include a knowledge of the universe he has formed—of the movements which are continually going on throughout the wide extent of his empire, in so far as they lie open to our inspection—of the attributes which appear to be displayed in all his operations—of the moral laws he has framed for the regulation of holy intelligences—of the merciful arrangements he has made for the restoration of fallen man—of the plans by which the knowledge of his will is to be circulated and extended in the world in which we live—of the means by which truth, and moral purity, and order, are to be promoted among our apostate race, in order to their restoration to the happiness they have lost—together with all those diversified ramifications of knowledge, which have either a more remote or a more immediate bearing on the grand object now specified. Like the lines which proceed from the circumference to the centre of an immense circle—all the *moral*\* arts and sciences which have been invented by men—every department of human knowledge, however far it may, at first sight, appear to be removed from religion—may be considered as having a direct bearing on Theology, as the grand central point, and as having a certain tendency to promote its important objects.

It is much to be regretted, that Theology has so seldom been contemplated in this point of view—and that the sciences have been considered

rather as so many independent branches of secular knowledge, than as subservient to the elucidation of the facts and doctrines of religion and to the accomplishment of its benevolent designs. Hence, it has happened that Philosophy and Religion, instead of marching hand in hand to the portals of immortality, have frequently set themselves in hostile array ; and combats have ensued equally injurious to the interests of both parties. The Philosopher has occasionally been disposed to investigate the economy of nature, without a reference to the attributes of that Almighty Being who presides over its movements, as if the universe were a self-moving and independent machine ; and has not unfrequently taken occasion, from certain obscure and insulated facts, to throw out insinuations hostile to the truth and the character of the Christian Revelation. The Theologian, on the other hand, in the heat of his intemperate zeal against the infidel philosopher, has unguardedly been led to declaim against the study of science, as if it were unfriendly to religion—has, in effect, set the works of God in opposition to his word—has confounded the foolish theories of speculative minds with the rational study of the works of Deity—and has thus prevented the mass of mankind from expanding their minds, by the contemplation of the beauties and sublimities of nature.

It is now high time that a complete reconciliation were effected between these contending parties. Religion ought never to disdain to derive her supports and illustrations from the researches of science ; for the investigations of philosophy into the economy of Nature, from whatever motives they may be undertaken, are nothing else than an inquiry into the plans and operations of the Eternal Mind. And Philosophy ought always to consider it as her highest honour, to walk as an handmaid in the train of that religion which points out the path to the regions of eternal bliss. By their mutual aid, and the subserviency of the one to the other, the moral and intellectual improvement of man will be promoted, and the benevolent purposes of God, in the kingdom of providence, gradually accomplished. But when set in opposition to each other, the human mind is bewildered and retarded in its progress, and the Deity is apt to be considered as set in opposition to himself—as proclaiming one system of doctrines from the economy of revelation, and another, and an opposite system, from the economy of nature. But if the Chris-

\* The epithet moral is here used in its application to arts, because there are certain arts which must be considered as having an immoral tendency, such as the art of war, the art of boxing, of gambling, &c. and which, therefore, cannot have a direct tendency to promote the objects of religion.

than Revelation and the system of the material world derived their origin from the same Almighty Being, the most complete harmony must subsist between the revelations they respectively unfold; and the apparent inconsistencies which occur must be owing chiefly to the circumstances of our present station in the universe, and to the obscure and limited views we are obliged to take of some of the grand and diversified objects they embrace. And, therefore, we have reason to believe that, when the system of nature shall be more extensively explored, and the leading objects of revelation contemplated in a clearer light, without being tinged with the false colouring of party opinions and contracted views, and when rational inquirers shall conduct their researches with a greater degree of reverence, humility and Christian temper, the beauty and harmony of all the plans and revelations of the Deity, in reference both to the physical and the moral world, will be more distinctly perceived and appreciated.

In the following cursory sketches, it forms no part of my plan to trace even an outline of the different sciences which are connected with religion, much less to enter into any particular details, in relation to their facts and principles. It would be comparatively easy to fill up the remaining sheets of this volume with skeletons of the different sciences; but such meager details as behooved to be brought forward, could not be interesting to the general reader, and would fail in accomplishing the object proposed. My design simply is, to select some leading facts, or general truths, in relation to some of the physical sciences, for the purpose of showing their connection with the objects of religion and the interests of rational piety. At the same time, such definite descriptions will be given as will enable common readers to appreciate the objects and bearings of the different branches of knowledge which may be presented to their view.

The first science\* I shall notice is that of

#### NATURAL HISTORY.

This science, taken in its most comprehensive sense, includes a knowledge and description of all the known facts in the material universe.

It is to be regretted, that most books published under the title of *Natural History*, to which common readers have access, contain nothing more than a general description of animals, as if this science were confined merely to one class of beings; whereas there is an infinite variety of

\* The term *science*, in its most general and extensive sense, signifies *knowledge*, particularly that species of knowledge which is acquired by the exertion of the human faculties. In a more restricted sense, it denotes a *systematic* species of knowledge, which consists of rule and order, such as Mathematics, Astronomy, Natural Philosophy, &c.—In the discussions contained in this work, it is used in its most general sense, as denoting the various departments of human knowledge, in which sense history, both natural, civil, and sacred, may be termed *science*.

other objects seldom noticed, which would appear no less interesting, and, in some instances, much more novel and gratifying to the general reader, and to the youthful mind. All the diversified forms of matter, whether existing on the surface or in the bowels of the earth, in the ocean, the atmosphere, or in the heavens, form the legitimate objects of this department of the science of nature.

Were we, therefore, to sketch a comprehensive outline of the subjects of Natural History, we might, in the first place, take a cursory survey of the globe we inhabit, in reference to its magnitude, figure, motions, and general arrangements—the form, relations, and extent of its continents—the numerous islands which diversify the surface of the ocean—the magnitude, the direction, and the extent of its rivers, and the quantity of water they pour into the ocean—the direction, elevation, and extent of the different ranges of mountains which rise from its surface—the plains, morasses, lakes, forests, dells, and sandy deserts, which diversify its aspect—the extent, the motions, the colour, and the different aspects of the ocean, and the facts which have been ascertained respecting its saltness, its depth, its bottom, and its different currents. We might next take a more particular view of some of the most remarkable objects on its surface, and give a detail of the facts which are known respecting the history of *volcanoes*—their number—the countries in which they are situated—the awful phenomena they exhibit—and the devastations they have produced; the history of *earthquakes*, their phenomena and effects, and the countries most subject to their ravages—basaltic and rocky wonders, natural bridges, precipices, cataracts, ice islands, icebergs, glaciers, whirlpools, mineral wells, reciprocating fountains, boiling springs, sulphuric mountains, bituminous lakes, volcanic islands—the various aspects of nature in the different zones, and the contrasts presented between the verdant scenes of tropical climes, and the icy cliffs of the polar regions. We would next take a survey of the subterraneous wonders which lie beneath the surface of the earth—the immense chasms and caverns which wind in various directions among the interior strata of our globe—such as the great Kentucky cavern, and the grotto of Antiparos—the mines of salt, coal, copper, lead, diamond, iron, quicksilver, tin, gold, and silver—the substances which compose the various strata, the fossil bones, shells, and petrifications, which are imbedded in the different layers, and the bendings and disruptions which appear to have taken place in the substances which compose the exterior crust of the earth. We might next survey the *atmosphere* with which the earth is environed, and give a detail of the facts which have been ascertained respecting its specific gravity and pressure, the elementary principles of which it is compounded, its refractive

and reflective powers, and the phenomena which result from its various properties and modifications—the *meteors* which appear in its different regions—thunder and lightning, winds, hail, rain, clouds, rainbows, parhelia or mock-suns, meteoric stones, the aurora borealis, luminous arches, ignes fatui, the mirage, the fata morgana, hurricanes, monsoons, whirlwinds and waterspouts, sounds and echoes.

In prosecuting our survey of sublunary nature, we would next advert to the various orders of the *vegetable tribes*—their anatomical structure—the circulation of their juices—the food by which they are nourished—the influence of light and air on their growth and motions—their male and female organs—their periods of longevity—their modes of propagation—their diseases and dissolution—their orders, genera, and species—their immense variety—their influence on the salubrity of the atmosphere—the relation which their roots, leaves, and fruits bear to the wants of man and other animals, in supplying food, clothing, and materials for constructing habitations—the gums and resinous substances they exude—the odours they exhale—the variety of colours they exhibit—the vast diversity of forms in which they appear—and the beauty and variety which they spread over the whole face of nature.

The *mineral kingdom* would next require to be surveyed. We would inquire into the facts which have been ascertained respecting the *earthy, saline, inflammable, and metallic* substances which are found on the surface and in the bowels of the earth—their specific and distinguishing characters—the elementary principles, or simple substances, of which they are composed—the regions of the earth where the respective minerals most frequently abound—and the ends which they are designed to accomplish in the constitution of the globe. We would consider, more particularly, the various metals, such as iron, copper, lead, tin, gold, silver, bismuth, zinc, &c. in reference to the substances with which they are united in their native ores—the changes produced upon them by the action of oxygen and the different acids—their combustibility—their combination with phosphorus, sulphur, and carbon; and the various compounds into which they may be formed—their important uses in the arts which minister to the comfort and embellishment of human life—their relation to the multifarious necessities of man—and the wisdom and goodness of the Creator, as displayed in their arrangement in the bowels of the earth, and in the admirable properties of which they are possessed. In these details, the natural history of *Iron* would hold a prominent place. In point of *utility*, it claims the highest rank in the class of metals, and is intrinsically more valuable than gold and silver, and all the diamonds of the East.—There is scarcely a mineral substance in the

whole compass of nature, which affords a more striking instance of the beneficial and harmonious adaptation of things in the universal system. We would, therefore, consider it in reference to its vast abundance in all parts of the world—the numerous substances into which it enters into combination—its magnetical property—its capability of being fused and welded—the numerous useful utensils it has been the means of producing—its agency in carrying forward improvements in art and science, in the civilization of barbarous tribes, and in promoting the progress of the human mind; and the aids which it affords to the Christian missionary in heathen lands.

Having surveyed the inanimate parts of the terraqueous globe, and its appendages, we might next direct our attention to the animated tribes with which it is peopled. Beginning at *Man*, the head of the animal creation, we would detail the principal facts which have been ascertained respecting his structure and organic functions—the muscular movements of the human body, the system of bones, nerves, veins, and arteries; the process of respiration; and the organs of vision, hearing, smelling, tasting, and feeling, by which he holds a correspondence with the material world—the modifications which appear in his corporeal frame and in his mental faculties, during the periods of infancy, puberty, manhood, and old age—the causes and phenomena of sleep and dreaming—the varieties of the human race, in respect of colour, stature, and features—the deviations from the ordinary course of nature, which occasionally occur, in the case of monsters, dwarfs, and giants—the moral and intellectual faculties—and those distinguishing characteristics which prove the superiority of man over the other tribes of animated nature.

The inferior ranks of the animal creation would next demand our attention. We would take a survey of the numerous tribes of *Quadrupeds, Birds, Fishes, Serpents, Lizards, and Insects*, in reference to the characteristic marks by which the different species are distinguished—their food and habitations—the different modes in which they display their architectonic faculty, in constructing places of abode for shelter and protection—the clothing with which they are furnished—their sagacity in finding out the proper means for subsistence and self-preservation—their hostilities—their artifices in catching their prey, and escaping their enemies—their modes of propagation—their transformations from one state and form to another—their migrations to different countries and climates—their various instincts—their care in rearing and protecting their young—their passions, mental characters, and social dispositions—their language, or modes of communication with each other—their capacities for instruction and improvement—their different powers of locomotion—the adaptation of all their organs to the purposes for which they

seem intended—the indications they give of being possessed of moral dispositions and rational powers—their different periods of longevity, and the ends which they are intended to subserve in the system of nature. Along with these details, certain views might be exhibited of the various forms of sensitive life, and modes of existence, which obtain in those numerous species of animals which are invisible to the naked eye, and which the microscope discovers in almost every department of nature.

Having surveyed the objects which compose our sublunary system, we would next direct our view to the regions of the sky, and contemplate the facts which have been discovered in relation to the celestial orbs. We would first attend to the apparent motion of the sun, the different points of the horizon at which he seems to rise and set, and the different degrees of elevation to which he arrives, at different seasons of the year,—the different aspects he presents as viewed from different parts of the earth's surface, and the different lengths of days and nights in different parts of the world. We would next attend to the varied phases of the moon—the direct and retrograde motions of the planets—the apparent diurnal motion of the whole celestial sphere, from east to west—and the different clusters of stars which are seen in our nocturnal sky, at different seasons of the year. We would next consider the deductions which science has made, respecting the order and arrangement of the planets which compose the solar system—their distances from the sun, and from the earth—their magnitudes—the periods of their diurnal and annual revolutions—the secondary planets, or moons, which accompany them—their eclipses—the various phenomena which their surfaces present when viewed through telescopes—the physical influence which some of them produce on the surface of our globe—and the singular appearance of those bodies called *Comets*, which occasionally visit this part of our system. We would, in the next place, extend our views to the starry regions, and consider the number of stars which present themselves to the naked eye—the immensely greater numbers which are discovered by telescopes—the systems into which they appear to be arranged—the facts which have been ascertained respecting new stars—double and triple stars—stars once visible, which have now disappeared from the heavens—variable stars, whose lustre is increased and diminished at different periods of time—and the structure and position of the many hundreds of *Nebulae*, or starry systems, which appear to be dispersed throughout the immensity of creation.

All the particulars now stated, and many others which might have been specified—considered simply as facts which exist in the system of Nature—form the appropriate and legitimate objects of Natural History, and demand the se-

rious attention of every rational intelligence that wishes to trace the perfections and agency of the Almighty Creator. To investigate the causes of the diversified phenomena which the material world exhibits, and the principles and modes by which many of the facts now alluded to are ascertained, is the peculiar province of Natural Philosophy, Chymistry, and the Mathematical Sciences.

Amid so vast a variety of objects as Natural History presents, it is difficult to fix on any particular facts, as specimens of the interesting nature of this department of knowledge, without going beyond the limits to which I am necessarily confined in this volume. I shall content myself with a description of two objects, which have a reference chiefly to the vegetable kingdom.—The first of these is

**THE BANIAN TREE.**—“This tree, which is also called the *Burr Tree*, or the *Indian Fig*, is one of the most curious and beautiful of Nature's productions, in the genial climate of India, where she sports with the greatest variety and profusion. Each tree is in itself a grove; and some of them are of an amazing size and extent, and, contrary to most other animal and vegetable productions, seem to be exempted from decay. Every branch from the main body throws out its own roots; at first, in small tender fibres, several yards from the ground; these continually grow thicker, until, by a gradual descent, they reach the surface, and there, striking in, they increase to large trunks, and become parent trees, shooting out new branches from the tops. These, in time, suspend their roots, and receiving nourishment from the earth, swell into trunks, and shoot forth other branches; thus continuing in a state of progression, so long as the earth, the first parent of them all, contributes her sustenance. A banian tree, with many trunks, forms the most beautiful walks, vistas, and cool recesses, that can be imagined. The leaves are large, soft, and of a lively green; the fruit is a small fig, when ripe of a bright scarlet, affording sustenance to monkeys, squirrels, peacocks, and birds of various kinds, which dwell among the branches.

“The Hindoos are peculiarly fond of the banian tree; they consider its long duration, its outstretching arms, and its overshadowing beneficence, as emblems of the Deity, and almost pay it divine honours. The brahmins, who thus ‘find a fane in every sacred grove,’ spend much of their time in religious solitude, under the shade of the banian tree; they plant it near their temples or pagodas; and in those villages where there is no structure erected for public worship, they place an image under one of these trees, and there perform a morning and evening sacrifice. The natives of all castes and tribes are fond of recreating in the cool recesses, beautiful walks, and lovely vistas of this umbrageous canopy, impervious to the hottest beams of a tropical sun. These

are the trees under which a sect of naked philosophers, called Gymnosophists, assembled in Arrian's days, and this historian of Ancient Greece presents a true picture of the modern Hindoos.—'In winter,' he says, 'the Gymnosophists enjoy the benefit of the sun's rays in the open air; and in summer, when the heat becomes excessive, they pass their time in cool and moist places, under large trees, which according to the accounts of Nearchus, cover a circumference of *six acres*, and extend their branches so far, that *ten thousand men* may easily find shelter under them.

"On the banks of the river Narbuddy, in the province of Guzerat, is a banian tree, supposed, by some persons, to be the one described by Nearchus, and certainly not inferior to it. It is distinguished by the name of Cubbeer Burr, which was given it in honour of a famous saint. High floods have, at various times, swept away a considerable part of this extraordinary tree; but what still remains, is nearly *two thousand feet* in circumference, measured round the principal stems; the overhanging branches, not yet struck down, cover a much larger space; and under it grow a number of custard-apple and other fruit trees. The large trunks of this single tree amount to *three hundred and fifty*; and the smaller ones exceed *three thousand*; every one of these is constantly sending forth branches and hanging roots, to form other trunks and become the parents of a future progeny. The Cubbeer Burr is famed throughout Hindostan, not only on account of its great extent, but also of its surpassing beauty. The Indian armies generally encamp around it; and at stated seasons, solemn Jataras, or Hindoo festivals, to which thousands of votaries repair, from every part of the Mogul empire, are there celebrated. It is said that seven thousand persons find ample room to repose under its shade. It has long been the custom of the British residents in India, on their hunting and shooting parties, to form extensive encampments, and spend weeks together, under this delightful and magnificent pavilion, which affords a shelter to all travellers, particularly to the religious tribes of the Hindoos. It is generally filled with greenwood pigeons, doves, peacocks, and a variety of feathered songsters—with monkeys, which both divert the spectator, by their antic tricks, and interest him by the paternal affection they display to their young offspring, in teaching them to select their food, and to exert themselves in jumping from bough to bough,—and is shaded by bats of a large size, many of them measuring upwards of six feet from the extremity of one wing to the other. This tree affords not only shelter, but sustenance, to all its inhabitants, being covered, amid its bright foliage, with small figs, of a rich scarlet, on which they all regale with as much delight as the lords of creation on their more costly fare, in their parties of pleasure."

- See *Encyclopædia Britannica*, Art. *Ficus*.

This tree, which is doubtless one of the most singular and magnificent objects in the vegetable kingdom, appears to be a world in miniature, in which thousands, both of human beings and of the inferior tribes that traverse the earth and the air, may find ample accommodation and subsistence. What a striking contrast does it present to the forests of trees, or mushrooms, which are perceived by the help of the microscope, in a piece of mouldiness—every plant of which is several hundreds of times smaller than the point of a fine needle! Yet both are the effects of the agency of the same All-wise and Omnipotent Being. And what an immense variety of gradations is to be found in the vegetable world, between these two extremes—every part of the vast interval being filled up with flowers, herbs, shrubs, and trees of every colour, form, and size, and in such vast multitudes and profusion that no man can number them!

An object, which approximates in a certain degree to the one now described, is mentioned in "Staunton's Account of Macartney's Embassy to China," p. 70. It is called by botanists *Adansonia*, and is also known by the name of the *Monkey Bread Tree*, and was discovered in the island of St. Jago. "The circumference or girth of the base was 56 feet, which soon divided into two vast branches, the one in a perpendicular direction, whose periphery, or girth, was 42 feet, the other 26. Another, of the same species, stood near it, whose single trunk, girthing only 38 feet, was scarcely noticed."

The only other specimen I shall exhibit to the reader has a relation both to the animal and to the vegetable kingdom. It is well known that the examination of flowers, and vegetables of every description, by the microscope, opens a new and interesting field of wonders to the inquiring naturalist. Sir John Hill has given the following curious account of what appeared on his examining a carnation.

"The principal flower in an elegant bouquet was a carnation: the fragrance of this led me to enjoy it frequently and near. The sense of smelling was not the only one affected on these occasions: while that was satiated with the powerful sweet, the ear was constantly attacked by an extremely soft, but agreeable murmuring sound. It was easy to know that some animal within the covert must be the musician, and that the little noise must come from some little creature, suited to produce it. I instantly distended the lower part of the flower, and placing it in a full light, could discover troops of little insects frisking, with wild jollity, among the narrow pedestals that supported its leaves, and the little threads that occupied its centre. What a fragrant world for their habitation! What a perfect security from all annoyance, in the dusky husk that surrounded the scene of action! Adapting a microscope to take in, at one view, the whole base of the flower, I

gave myself an opportunity of contemplating what they were about, and this for many days together, without giving them the least disturbance. Thus, I could discover their economy, their passions, and their enjoyments. The microscope, on this occasion, had given what nature seemed to have denied to the objects of contemplation. The base of the flower extended itself under its influence to a vast plain; the slender stems of the leaves became trunks of so many stately cedars; the threads in the middle seemed columns of massy structure, supporting at the top several ornaments; and the narrow spaces between were enlarged into walks, parterres, and terraces. On the polished bottoms of these, brighter than Parian marble, walked in pairs, alone, or in larger companies, the winged inhabitants; these from little dusky flies, for such only the naked eye would have shown them, were raised to glorious glittering animals, stained with living purple, and with a glossy gold, that would have made all the labours of the loom contemptible in the comparison. I could, at leisure, as they walked together, admire their elegant limbs, their velvet shoulders, and their silken wings; their backs vying with the empyrean in its blue; and their eyes, each formed of a thousand others, outglittering the little planes on a brilliant; above description, and too great almost for admiration. I could observe them here singling out their favourite females; courting them with the music of their buzzing wings with little songs, formed for their little organs; leading them from walk to walk, among the perfumed shades, and pointing out to their taste the drop of liquid nectar, just bursting from some vein within the living trunk—here were the perfumed groves, the more than mystic shades of the poet's fancy realized. Here the happy lovers spent their days in joyful dalliance, or, in the triumph of their little hearts, skipped after one another from stem to stem, among the painted trees, or winged their short flight to the close shadow of some broader leaf, to revel undisturbed in the heights of all felicity."

This picture of the splendour and felicity of insect life, may, to certain readers, appear somewhat overcharged. But those who have been much in the habit of contemplating the beauties of the animal and vegetable world, through microscopes, can easily enter into all the views which are here described. I have selected this example, for the purpose of illustrating the unbounded goodness of the Creator, in the vast profusion of enjoyment he has communicated, even to the lowest tribes of animal existence, and as a specimen of those invisible worlds which exist beyond the range of our natural vision. For it appears that there is a gradation of worlds downward as well as upward. However small our globe may appear when compared with the sun and with the immensity of starry systems which lie dispersed through the infinity

of space, there are worlds filled with myriads of living beings, which, in point of size and extent, bear as small a proportion to the earth, as the earth bears to the vast assemblage of the celestial worlds. A single flower, a leaf, or a drop of water, may appear as large and as diversified in its structure, to some of the beings which inhabit it, as the whole earth appears to the view of man; and a thousand scenes of magnificence and beauty may be presented to their sight, of which no distinct conception can be formed by the human mind. The many thousands of transparent globes, of which their eyes are composed, may magnify and multiply the objects around them without end, so that an object scarcely visible to the eye of man may appear to them as a vast extended universe.

"Having examined," says St. Pierre, "one day, by a microscope, the flowers of thyme, I distinguished in them, with equal surprise and delight, superb flagons with a long neck, of a substance resembling the amethyst, from the gullets of which seemed to flow ingots of liquid gold. I have never made observations of the corolla, simply of the smallest flower, without finding it composed of an admirable substance, half transparent, studded with brilliants, and shining in the most lively colours. The beings which live under a reflex thus enriched, must have ideas very different from ours, of light, and of the other phenomena of nature. A drop of dew, filtering in the capillary and transparent tubes of a plant, presents to them thousands of cascades; the same drop fixed as a wave on the extremity of one of its prickles, an ocean without a shore; evaporated into air, a vast aerial sea. It is credible, then, from analogy, that there are animals feeding on the leaves of plants like the cattle in our meadows and on our mountains, which repose under the shades of a down imperceptible to the naked eye, and which, from goblets formed like so many suns, quaff nectar of the colour of gold and silver."

Thus it appears, that the universe extends to infinity on either hand; and that whenever matter exists, from the ponderous globes of heaven down to the invisible atom, there the Almighty Creator has prepared habitations for countless orders of existence, from the seraph to the animalcula, in order to demonstrate his boundless beneficence, and the infinite variety of modes by which he can diffuse happiness through the universal system.

"How sweet to muse upon His skill display'd  
Infinite skill! in all that he has made;  
To trace in nature's most minute design  
The signature and stamp of power divine;  
Contrivance exquisite, expressed with ease,  
Where unassisted sight no beauty sees;  
The shapely limb and lubricated joint,  
Within the small dimensions of a point;  
Muscle and nerve miraculously spun,  
His mighty work who speaks and it is done;  
Th' invisible in things scarce seen reveal'd;  
To whom an atom is an ample field!"

*Cooper's Estimation.*

With regard to the religious tendency of the study of Natural History, it may be remarked—that, as all the objects which it embraces are the *workmanship of God*—the delineations and descriptions of the Natural Historian must be considered as “The history of the operations of the Creator;” or, in other words, so far as the science extends, “The history of the Creator himself:” for the marks of his incessant agency, his power, wisdom, and beneficence, are impressed on every object, however minute, throughout the three kingdoms of nature, and throughout every region of earth, air, and sky. As the Deity is invisible to mortal eyes, and cannot be directly contemplated by finite minds, without some material medium of communication—there are but two mediums with which we are acquainted, by which we can attain a knowledge of his nature and perfections. These are, either the *facts* which have occurred in the course of his providential dispensations towards our race, since the commencement of time, and the moral truths connected with them—or, the facts which are displayed in the economy of nature. The first class of facts is recorded in the Sacred History, and in the Annals of Nations; the second class is exhibited in the diversified objects and motions which appear throughout the system of the visible universe. The one may be termed the *Moral History*, and the other, the *Natural History*, of the operations of the Creator. It is obviously incumbent on every rational being, to contemplate the Creator through both these mediums; for each of them conveys its distinct and peculiar revelations; and consequently our perception of Deity through the one medium does not supersede the necessity of our contemplating him through the other. While, therefore, it is our duty to contemplate the perfections, the providence, and the agency of God, as displayed in the Scripture Revelation, it is also incumbent upon us, to trace his attributes in the System of Nature, in order that we may be enabled to contemplate the eternal Jehovah, in every variety of aspect, in which he has been pleased to exhibit himself, in the universe he has formed.

The visible creation may be considered as a permanent and sensible manifestation of Deity, intended every moment to present to our view the unceasing energies of Him “in whom we live and move.” And if the train of our thoughts were directed in its proper channel, we would perceive God in every object, and in every movement: we would behold him operating in the whirlwind, and in the storm; in the subterraneous cavern, and in the depths of the ocean; in the gentle rain, and the refreshing breeze; in the rainbow, the fiery meteor, and the lightning’s flash; in the splendours of the sun, and the majestic movements of the heavens; in the frisking of the lambs, the songs of birds, and the buzz of insects, in the circulation of our blood, the move-

ments of our joints, the motion of our eyeballs and in the rays of light which are continually darting from surrounding objects, for the purposes of vision. For these, and ten thousand other agencies in the system of nature, are nothing else but the voice of Deity, proclaiming to the sons of men, in silent but emphatic language, “Stand still, and consider the wonderful works of God.”

If, then, it be admitted, that the study of Nature is the study of the Creator—to overlook the grand and beautiful scenery with which we are surrounded, or to undervalue any thing which Infinite Wisdom has formed, is to overlook and condemn the Creator himself. Whatever God has thought proper to create, and to present to our view in the visible world, it becomes man to study and contemplate, that, from thence, he may derive motives to excite him to the exercise of reverence and adoration, of gratitude and praise. In so far as any individual is unacquainted with the various facts of the history of nature, in so far does he remain ignorant of the manifestations of Deity; for every object, on the theatre of the universe, exhibits his character and designs in a different point of view. He who sees God only as he displays himself in his operations on the earth, but has never contemplated the firmament with the eye of reason, must be unacquainted with those amazing energies of eternal Power, which are displayed in the stupendous fabric and movements of the orbs of heaven. He who sees God only in the general appearances of nature, but neglects to penetrate into his minute operations, must remain ignorant of those astonishing manifestations of divine wisdom and skill which appear in the contrivances, adaptations, and functions of the animal and the vegetable kingdoms. For, the more we know of the work, the more accurate and comprehensive will be our views of the Intelligence by whom it was designed; and the farther we carry our investigations of the works of God, the more admirable and astonishing will his plans and perfections appear.

In short, a devout contemplation of the works of nature tends to ennoble the human soul, and to dignify and exalt the affections. It inspires the mind with a relish of the beauty, the harmony, and order which subsist in the universe around us—it elevates the soul to the love and admiration of that Being who is the author of our comforts, and of all that is sublime and beneficent in creation, and excites us to join with all holy beings in the chorus of praise to the God and Father of all. For they

“Whom Nature’s works can charm, with God himself  
Hold converse, grow familiar day by day  
With his conceptions, act upon his plan,  
And form to his the relish of their souls.”

The man who surveys the vast field of nature with the eye of reason and devotion, will not only

gain a more comprehensive view of that illimitable power which organized the universe, but will find his sources of enjoyment continually increased, and will feel an ardent desire after that glorious world, where the veil which now hides from our sight some of the grandest manifestations of Deity will be withdrawn, and the wonders of Omnipotence be displayed in all their splendour and perfection.

In conformity with these sentiments, we find the inspired writers, in numerous instances, calling our attention to the wonders of creating power and wisdom. In one of the first speeches in which the Almighty is introduced as addressing the sons of men, and the longest one in the Bible,\* our attention is exclusively directed to the subjects of Natural History;—the whole address having a reference to the economy of Divine Wisdom in the arrangement of the world at its first creation—the wonders of the ocean, and of light and darkness—the phenomena of thunder and lightning, rain, hail, snow, frost, and other meteors in the atmosphere—the intellectual faculties of man, and the economy and instincts of quadrupeds, birds, fishes, and other tribes of animated existence. Indeed, the greater part of the sublime descriptions contained in the book of Job has a direct reference to the agency of God in the material creation, and to the course of his providence in relation to the different characters of men; and the reasonings of the different speakers in that sacred drama proceed on the supposition that their auditors were intimately acquainted with the varied appearances of nature, and their tendency to exhibit the character and perfections of the Omnipotent Creator. We find the Psalmist, in the 104th Psalm, employed in a devout description of similar objects, from the contemplation of which his mind is raised to adoring views of their Almighty Author—and, from the whole of his survey, he deduces the following conclusions:—"How manifold are thy works, O Lord! *In wisdom thou hast made them all!* The earth is full of thy riches; so is this great and wide sea, wherein are things creeping innumerable, both small and great beasts. The glory of the Lord shall endure for ever; the Lord shall rejoice in all his works.† I will sing unto the Lord as long as I live; I will sing praises to my God, while I have my being."

\* Job, chap. xxxviii. xxxix. xl. xli.

† The *glory* of the Lord, in this passage, denotes the display of his perfections in the material universe; and the declaration of the inspired writer plainly intimates, that this display will continue *for ever*, and will remain as an object of unceasing contemplation to all intelligences, and as an eternal monument of his power and wisdom. For, although the earth and the aerial heavens will be changed at the close of that dispensation of Providence which respects our world, yet the general frame of the universe, in its other parts, will remain substantially the same; and not only so, but will in all probability be perpetually increasing in magnitude and grandeur. And the change which will be effected in respect

But in order to enter into the spirit of such sublime reflections, we must not content ourselves with a superficial and cursory view of the objects and operations of nature,—we must not think it sufficient to acquiesce in such vague propositions as these—"The glory of God is seen in every blade of grass, and every drop of water; all nature is full of wonders, from the dust of the earth to the stars of the firmament." We must study the works of creation with ardour, survey them with minute attention, and endeavour to acquire a *specific* and *comprehensive* knowledge of the Creator's designs. We must endeavour to acquire a knowledge of the particular modes, circumstances, contexture, configurations, adaptations, structure, functions, and relations of those objects in which benevolence and design conspicuously appear—in the animal and the vegetable world, in the ocean, the atmosphere, and the heavens; that the mind may be enabled to draw the conclusion with full conviction and intelligence—"In wisdom thou hast made them all." The pointed interrogatories which Jehovah addressed to Job, evidently imply, that Job had previously acquired an intimate acquaintance with the works of nature. It seems to be taken for granted, as a matter of course, that he made himself acquainted with the general range of facts in the visible creation; and the intention of the several questions presented to his consideration evidently was to impress him with a sense of his own impotency, and to lead him to the investigation of the wonders of Creating Power which he had formerly overlooked. The conclusion which the Psalmist draws respecting the *Wisdom* displayed throughout all the works of God, plainly intimates, that he had made the different parts of nature the subject of minute examination, and of deep reflection; otherwise he could not have rationally deduced his conclusion, or felt those emotions which filled his mind with the pious rapture so beautifully expressed in that hymn of praise to the Creator of the world.

We have, therefore, reason to believe, from these and other instances, that pious men, "in the days of old," were much more accustomed than modern Christians to contemplate and admire the visible works of the Lord—and it is surely much to be regretted, that we who enjoy so many superior means of information, and who have access to the brilliant discoveries of later and more enlightened times, should manifest so much disregard to "the works of Jehovah and the operations of his hands." To enable the common mass of Christians to enter into the spirit of this delightful study and *Christian duty*, should, therefore, be one object of those periodical and other religious works which are put into their hands; so that they may be enabled, with

to the terraqueous globe and its appendages will be such that Jehovah will have reason to "rejoice" in this as well as in all his other works.

vigour and intelligence, to form the pious resolution of Asaph, "I will meditate on all thy works, O Lord! and talk of thy doings."—"I will utter abundantly the memory of thy great goodness, and tell of thy wondrous works."<sup>a</sup>

## GEOGRAPHY.

The next department of knowledge I shall notice is the science of Geography.

The object of this science is, to describe the world we inhabit, in reference to the continents, islands, mountains, oceans, seas, rivers, empires, and kingdoms with which it is diversified, together with the manners, customs, and religion of the different tribes which people its surface.

In order to form an accurate conception of the relative positions of objects on the surface of the earth, and to enter with intelligence on the study of this subject, it is requisite, first of all, to have an accurate idea of its figure and magnitude. For a long series of ages it was supposed, by the bulk of mankind, that the surface of the earth was nearly a plane, indefinitely extended, and bounded on all sides by the sky. Lactantius, and several of the fathers of the Christian church, strenuously argued that the earth was extended infinitely downwards, and established upon several foundations. The ancient philosopher Heraclitus is said to have believed that the earth was of the shape of a skiff or canoe, very much hollowed; and the philosopher Leucippus supposed it to be of the form of a cylinder or a drum. It is only within the period of the last three hundred years that the true figure of the earth has been accurately ascertained. This figure is now found to be that of an oblate spheroid, nearly approaching to the shape of a globe or sphere. To have asserted this opinion several ages ago would have been considered as a heresy in religion, and would have subjected its abettors to the anathemas of the church, and even to the peril of their lives. Historians inform us that the learned Spigelius, Bishop of Upsal, in Sweden, suffered martyrdom at the stake, in defence of the doctrine of the *Antipodes*; and we know that, for asserting the motion of the earth, the celebrated philosopher Galileo was immured in a dungeon, and condemned by an assembly of cardinals to all the horrors of perpetual imprisonment. The doctrine he maintained, and which is now universally received by every one acquainted with the subject, was declared by those arrogant ecclesiastics to be "a proposition absurd in its very nature, false in philosophy, heretical in religion, and contrary to the Holy Scriptures." Such are some of the horrible

<sup>a</sup> A select list of popular works on Natural History, and the other sciences noticed in the following sketches, will be found in the appendix.

and pernicious consequences which flow from ignorance of the phenomena of nature, and of those laws by which the Almighty governs the universe he has formed; and which prove it to be a Christian duty for every rational being to study the order and economy of the visible world.

That the earth is nearly of a globular figure, is proved by the following considerations:—1. When we stand on the seashore, while the sea is perfectly calm, we perceive that the surface of the water is not quite plain, but convex or rounded; and if we are on one side of an arm of the sea, as the Frith of Forth, and, with our eyes near the water, look towards the opposite coast, we shall plainly see the water elevated between our eyes and the opposite shore, so as to prevent our seeing the land near the edge of the water. The same experiment may be made on any portion of still water, of a mile or two in extent, when its convexity will be perceived by the eye. A little boat, for instance, may be perceived by a man who is any height above the water, but if he stoops down, and lays his eye near the surface, he will find that the fluid appears to rise, and intercept the view of the boat. 2. If we take our station on the seashore, and view the ships leaving the coast, in any direction—as they retire from our view, we may perceive the masts and rigging of the vessels when the hulls are out of sight, and, as it were, sunk in the water. On the other hand, when a ship is approaching the shore, the first part of her that is seen is the topmast; as she approaches nearer, the sails become visible, and last of all, the hull comes gradually into view.† The reason of such appearances obviously is, that the round or convex surface of the water interposes between our eye and the body of the ship, when she has reached a certain distance, while, at the same time, the sails and topmast, from their greater elevation, may be still in view. To the same cause it is owing, that the higher the eye is placed, the more extensive is the prospect; and hence it is common for sailors to climb to the tops of masts, in order to discover land or ships at a distance. The contrary of all this would take place, if the earth and waters were an extended plane. When a ship came within view, the hull would first make its appearance, being the largest object, next the sails, and, last of all, the topmast. These considerations, which hold true in all parts of the world, prove to a certainty, that the mass of the ocean is of a globular form: and if the ocean be a portion of a sphere, it follows that the *land* also is of the same general figure; for no portion of the earth's surface is elevated above four or five

† In order to make such observations to advantage, the observer's eye should be as near as possible on a level with the sea, and he should use a telescope to enable him to perceive more distinctly the upper part of the vessel.

miles above the level of the ocean. 3. That the earth is round from north to south, appears from the following circumstance :—When we travel a considerable distance from north to south, or from south to north, a number of new stars successively appear in the heavens, in the quarter to which we are advancing, and many of those in the opposite quarter gradually disappear, which would not happen if the earth were a plane in that direction. 4. That the earth is round from east to west, appears from actual experiment ; for many navigators, by sailing in a westerly direction, have gone quite round it, from east to west ; and were it not for the frozen seas within the polar regions, which interrupt navigation in those directions, it would, long ere now, have been circumnavigated from north to south. 5. All those proofs are confirmed and illustrated by eclipses of the moon, which present an *ocular demonstration* of the earth's rotundity. An eclipse of the moon is caused by the intervention of the body of the earth between the sun and moon ; in which case the shadow of the earth falls upon the moon. This shadow is found, in all cases, and in every position of the earth, to be of a circular figure ; which incontrovertibly proves, that the whole mass of land and water, of which the earth is composed, is nearly of a globular form. The mountains and vales which diversify its surface detract little or nothing from its globular shape ; for they bear no more proportion to its whole bulk than a few grains of sand to a common terrestrial globe ; the highest mountains on its surface being little more than the two-thousandth part of its diameter. Some of the mountains on the surface of the moon are higher than those on the earth, and yet that body appears, both to the naked eye and through telescopes, of a spherical figure.

To some readers, the discovery of the true figure of the earth may appear as a matter of very trivial importance in religion. I hesitate not, however, to affirm that it constitutes a most important fact in the history of Divine Providence. Had not this discovery been made, it is probable that the vast continent of America might yet have remained undiscovered ; for, Columbus, who first discovered that new world, had learned, contrary to the general opinion of the times, that the earth was of a spherical figure ; and, from the maps then existing, he began to conjecture, that the nearest way of sailing to the East Indies would be to sail westward. And although he missed the object of his research, he was the means of laying open to view a vast and unknown region of the earth, destined, in due time, to receive from the Eastern world the blessings of knowledge, civilization, and religion. On the knowledge of the spherical figure of the earth, the art of navigation in a great measure depends ; and all the voyages of discovery, which have been made

in later years, were undertaken in consequence of the knowledge of this fact. Had mankind remained unacquainted with this discovery, the circumnavigation of the globe would never have been attempted—vast portions of the habitable world would have remained unknown and unexplored—no regular intercourse would have been maintained between the various tribes of the human race ; and, consequently, the blessings of Divine Revelation could never have been communicated to the greater part of the Gentile world. Besides, the knowledge of the true figure and magnitude of our sublunary world forms the groundwork of all the sublime discoveries which have hitherto been made in the regions of the firmament. For its diameter forms the base line of those triangles by which the distances and magnitudes of the celestial globes have been determined ; without a knowledge of the extent of which, the important results which have been deduced respecting the system of the universe could not have been ascertained, and, consequently, our views of the grandeur and omnipotence of the Deity, and of the magnificence and extent of his dominions, must have been much more circumscribed than they now are. Such is the intimate connexion that subsists between every part of the chain of Divine dispensations, that if any one link had been either broken or dissolved, the state of things, in the moral and intellectual world, would have been very different from what it now is ; and the plans of Providence, for accomplishing the renovation and improvement of mankind, would have been either partially or totally frustrated.

With regard to the *magnitude* of the earth—I have already stated the mode by which we may acquire the most accurate and comprehensive conception of this particular, in the course of the illustrations which were given of the omnipotence of Deity, (pp. 9—11.) It is necessary here only to remark—that, according to the latest computations, the diameter of the earth is about 7,930 miles, and its circumference 24,912 miles ; and consequently, the whole surface of the land and water it contains comprehends an area of 197,552,160 miles. The proportion of land and water on its surface cannot be very accurately ascertained ; but it is quite evident, from an inspection of a map of the world, that the water occupies at least two-thirds of its surface, and, of course, the land cannot occupy more than one-third. Supposing it to be only one-fourth of the earth's surface, it will contain 49,387,040 square miles, which is considerably more than what is stated in most of our late systems of geography ; in some of which the extent of the land is rated at 39 millions, and in others so low as 30 millions of square miles—the former of which statements being less than one-fifth, and the latter less than one-sixth of the surface of the globe. But it is

quite obvious that the extent of the land cannot be less than one-fourth of the area of the globe, and must, therefore, comprehend at least 50 millions of square miles. And if a large arctic continent, eleven hundred leagues in length, exist around the North Pole, as some French philosophers infer from Captain Parry's late discoveries\*—the quantity of land on the terrestrial globe will be much greater than what has been now stated.

**GENERAL DIVISIONS OF THE EARTH.**—The surface of the earth is divided, from north to south, by two bands of earth, and two of water. The first band of earth is the ancient or Eastern Continent, comprehending Europe, Asia, and Africa; the greatest length of which is found to be in a line beginning on the east point of the northern part of Tartary, and extending from thence to the Cape of Good Hope, which measures about 10,000 miles, in a direction nearly from north-east to south-west; but if measured according to the meridians, or from north to south, it extends only 7,500 miles, from the northernmost cape in Lapland to the Cape of Good Hope. This vast body of land contains about 36 millions of square miles, forming nearly one-fifth of the whole surface of the globe. The other band of earth is what is commonly called the New Continent, which comprehends North and South America. Its greatest length lies in a line beginning at the mouth of the river Plata, passing through the island of Jamaica, and terminating beyond Hudson's Bay; and it measures about 8,000 miles. This body of land contains about 14 millions of square miles, or somewhat more than a third of the old continent.

It may not be improper here to remark, that the two lines now mentioned, which measure the greatest lengths of the two continents, divide them into two equal parts, so that an equal portion of land lies on each side of these lines, and that each of these lines has an inclination of about 30 degrees to the equator, but in opposite directions; that of the old continent extending from the north-east to the south-west, and that of the new continent from the north-west to the south-east; and that they both terminate at the same degree of northern and southern latitude. It may also be noticed, that the old and new continents are almost opposite to each other, and that the old is more extensive to the north of the equator, and the new more extensive to the south. The centre of the old continent is in the 17th degree of north latitude, and the centre of the new in the 17th degree of south latitude; so that they seem to be made to counterbalance each other, in order to preserve the equability of the diurnal rotation of the earth. There is also a singular connexion between the two continents, namely, that if they were divided into

two parts, all four would be surrounded by the sea, were it not for the two small necks of land called the isthmuses of Suez and Panama.†

Between the two continents now mentioned, lie two immense bands of water, termed the Pacific and the Atlantic oceans, whose greatest length is likewise in a direction from north to south.

Besides the two bands of earth to which I have adverted, many extensive portions of land are dispersed through the ocean, which covers the remaining part of the earth's surface; particularly the extensive regions of New Holland, which occupy a space nearly as large as the whole of Europe, and the arctic continent, which probably exists within the northern polar regions, and which some French writers propose to designate by the name of *Boreasia*, is in all probability, of equal extent. There are also the extensive islands of New Guinea, Borneo, Madagascar, Sumatra, Japan, Great Britain, New Zealand, Ceylon, Iceland, Cuba, Java, and thousands of others, of different dimensions, scattered through the Pacific, the Indian, and the Atlantic oceans, and which form a very considerable portion of the habitable regions of the globe.

**GENERAL FEATURES OF THE EARTH'S SURFACE.**—In taking a general survey of the external features of the earth, the most prominent objects that strike the eye are those huge elevations which rise above the level of its general surface, termed **HILLS AND MOUNTAINS**. These are distributed, in various forms and sizes, through every portion of the continents and islands; and, running into immense chains, form a sort of connecting band to the other portion of the earth's surface. The largest mountains are generally formed into immense chains, which extend, in nearly the same direction, for several hundreds, and even thousands of miles. It has been observed by some philosophers, that the most lofty mountains form two immense ridges, or belts, which, with some interruptions, extend around the whole globe, in nearly the same direction. One of these ridges lies between the 45th and 55th degree of north latitude. Beginning on the western shores of France and Spain, it extends eastward, including the Alps and the Pyrenees, in Europe, the Uralian and Altaic mountains, in Asia—extending from thence to the shores of Kamschatka, and after a short interruption from the sea, they rise again on the western coast of America, and terminate at Canada, near the eastern shore. It is supposed that the chain is continued completely round the globe, through the space that is covered by the Atlantic ocean, and that the Azores, and other islands in that direction, are the only summits that are visible, till we come to the British isles. The other ridge runs along the Southern hemi-

\* See Monthly Magazine, April, 1822, p. 222.

† See Buffon's Natural History, vol. 1.

sphere, between the 50th and 90th degrees of south latitude, of which detached portions are found in the mountains of Tucuman, and of Paraguay, in South America,—of Monomotapa and Caffraria, in Africa; in New Holland, New Caledonia, the New Hebrides, the Friendly, the Society, and other islands in the Pacific ocean. From these ridges flows a variety of ramifications, in both hemispheres, towards the Equator, and the Poles, which altogether present a magnificent scenery, which diversifies and enlivens the surface of our globe.

The highest mountains in the world, according to some late accounts published in the "Transactions of the Asiatic Society," are the *Himalaya* chain, north of Bengal, on the borders of Thibet. The highest mountain in this range is stated to be about 27,000 feet, or a little more than five miles, in perpendicular height, and is visible at the distance of 250 miles. Nineteen different mountains in this chain are stated to be above four miles in perpendicular elevation. Next to the Himalayas, are the Andes, in South America, which extend more than 4000 miles in length, from the province of Quite to the straits of Magellan. The highest summit of the Andes is Chimborazo, which is said to be 20,600 feet, or nearly four miles, above the level of the sea. The highest mountains in Europe, are the Alps, which run through Switzerland and the north of Italy,—the Pyrenees, which separate France from Spain, and the Dofrafeld, which divide Norway from Sweden. The most elevated ridges in Asia, are Mount Taurus, Imaus, Caucasus, Ararat, the Uralian, Altaian, and the mountains of Japan—in Africa, Mount Atlas, and the mountains of the Moon. Some of the mountains in these ranges are found to contain immense caverns or perforations, of more than two miles in circumference, reaching from their summits to an immeasurable depth into the bowels of the earth. From these dreadful openings are frequently thrown up, to an immense height, torrents of fire and smoke, rivers of melted metals, clouds of ashes and cinders, and sometimes red-hot stones and enormous rocks, to the distance of several miles, accompanied with thunders, lightnings, darkness, and horrid subterraneous sounds—producing the most terrible devastations through all the surrounding districts. The most noted mountains of this kind in Europe, are mount Hecla, in Iceland; Etna, in Sicily; and Vesuvius, near the city of Naples, in Italy. Numbers of volcanoes are also to be found in South America, in Africa, in the islands of the Indian ocean, and in the Empire of Japan.\*

We who live in Great Britain, where the highest mountain is little more than three-quarters of a mile in perpendicular elevation, can

\* A more particular description of the phenomena of these terrific objects will be found in Chap. iv. Sect. 2.

form no adequate idea of the magnificence and awful sublimity of the mountain scenery in some of the countries now mentioned; especially when the volcano is belching forth its flames with a raging noise, and spreading terror and desolation around its base. From the tops of the lofty ridges of the Andes, the most grand and novel scenes sometimes burst upon the eye of the astonished traveller. He beholds the upper surface of the clouds far below him, covering the subjacent plain, and surrounding, like a vast sea, the foot of the mountain; while the place on which he stands appears like an island in the midst of the ocean. He sees the lightnings issuing from the clouds, and hears the noise of the tempest, and the thunders rolling far beneath his feet, while all is serene around him, and the blue vault of heaven appears without a cloud. At other times, he contemplates the most sublime and extensive prospects—mountains ranged around him, covered with eternal snows, and surrounding, like a vast amphitheatre, the plains below—rivers winding from their sources towards the ocean—cataracts dashing headlong over tremendous cliffs—enormous rocks detached from their bases, and rolling down the declivity of the mountains with a noise louder than thunder—frightful precipices impending over his head—unfathomable caverns yawning from below—and the distant volcano sending forth its bellowings, with its top enveloped in the fire and smoke.—Those who have studied nature on a grand scale, have always been struck with admiration and astonishment at the sublime and awful exhibition of wonders which mountainous regions exhibit and, perhaps, there is no *terrestrial* scene which presents, at one view, so many objects of overpowering magnitude and grandeur, and which inspires the mind with so impressive an idea of the power of that Almighty Being, who "weigheth the mountains in scales, and taketh up the isles as a very little thing."

THE OCEAN.—The ocean surrounds the earth on all sides, and penetrates into the interior parts of different countries; sometimes by large openings, and frequently by small straits. Could the eye take in this immense sheet of waters at one view, it would appear the most august object under the whole heavens. It occupies a space on the surface of the globe at least three times greater than that which is occupied by the land; comprehending an extent of 148 millions of square miles. Though the ocean, strictly speaking, is but one immense body of waters extending in different directions, yet different names have been appropriated to different portions of its surface. That portion of its waters which rolls between the western coast of America and the eastern of Asia, is called the *Pacific* ocean; and that portion which separates Europe and Africa from America, the *Atlantic* ocean. Other portions are

named the *Northern, Southern, and Indian oceans*. When its waters penetrate into the land, they form what are called gulfs, and mediterranean seas. But without following it through all its windings and divisions, I shall state a few general facts.

With regard to the *depth* of this body of water, no certain conclusions have yet been formed. Beyond a certain depth, it has hitherto been found unfathomable. We know, in general, that the depth of the sea increases gradually as we leave the shore; but we have reason to believe that this increase of depth continues only to a certain distance. The numerous islands scattered every where through the ocean, demonstrate, that the bottom of the waters, so far from uniformly sinking, sometimes rises into lofty mountains. It is highly probable, that the depth of the sea is somewhat in proportion to the elevation of the land; for there is some reason to conclude, that the present bed of the ocean formed the inhabited part of the ancient world, previous to the general deluge, and that we are now occupying the bed of the former ocean; and, if so, its greatest depth will not exceed four or five miles; for there is no mountain that rises higher above the level of the sea. But the sea has never been actually sounded to a greater depth than a mile and sixty-six feet. Along the coast its depth has always been found proportioned to the height of the shore; where the coast is high and mountainous, the sea that washes it is deep; but where the coast is low, the water is shallow. To calculate the *quantity of water* it contains, we must therefore suppose a medium depth. If we reckon its average depth at two miles, it will contain 296 millions of cubical miles of water. We shall have a more specific idea of this enormous mass of water, if we consider, that it is sufficient to cover the whole globe, to the height of more than eight thousand feet; and if this water were reduced to one spherical mass, it would form a globe of more than 800 miles in diameter.

With regard to its *bottom*—As the sea covers so great a part of the globe, we should, no doubt, by exploring its interior recesses, discover a vast number of interesting objects. So far as the bed of the ocean has been explored, it is found to bear a great resemblance to the surface of the dry land; being, like it, full of plains, caverns, rocks, and mountains, some of which are abrupt and almost perpendicular, while others rise with a gentle acclivity, and sometimes tower above the water, and form islands. The materials, too, which compose the bottom of the sea, are the same which form the basis of the dry land. It also resembles the land in another remarkable particular;—many fresh springs, and even rivers, rise out of it; an instance of which appears near Goa, on the western coast of Hindostan, and in the Mediterranean sea, not far from

Marzeilles. The sea sometimes assumes *different colours*. The materials which compose its bottom cause it to reflect different hues in different places; and its appearance is also affected by the winds and by the sun, while the clouds that pass over it communicate all their varied and fleeting colours. When the sun shines, it is green; when he gleams through a fog, it is yellow; near the poles, it is black, while, in the torrid zone, its colour is often brown; and, on certain occasions, it assumes a luminous appearance, as if sparkling with fire.

The ocean has *three kinds of motion*. The first is that undulation which is produced by the wind, and which is entirely confined to its surface. It is now ascertained that this motion can be destroyed, and its surface rendered smooth, by throwing oil upon its waves. The second motion is, that continual tendency which the whole water in the sea has towards the west, which is greater near the equator than towards the poles. It begins on the west side of America, where it is moderate; but as the waters advance westward, their motion is accelerated; and, after having traversed the globe, they return, and strike with great violence on the eastern shore of America. Being stopped by that continent, they rush, with impetuosity, into the Gulf of Mexico, thence they proceed along the coast of North America, till they come to the south side of the great bank of Newfoundland, when they turn off and run down through the Western Isles. This motion is most probably owing to the diurnal revolution of the earth on its axis, which is in a direction contrary to the motion of the sea. The third motion of the sea is the *tide*, which is a regular swell of the ocean every 12½ hours. The motion is now ascertained to be owing to the attractive influence of the moon, and also partly to that of the sun. There is always a flux and reflux at the same time, in two parts of the globe, and these are opposite to each other; so that when our antipodes have high water we have the same. When the attractive powers of the sun and moon act in the same direction, which happens at the time of new and full moon, we have the highest, or *spring tides*; but when their attraction is opposed to each other, which happens at the quarters, we have the lowest, or *neap tides*.

Such is the ocean,—a most stupendous scene of Omnipotence, which forms the most magnificent feature of the globe we inhabit. When we stand on the seashore, and cast our eyes over the expanse of waters, till the sky and the waves seem to mingle, all that the eye can take in at one survey, is but an inconsiderable *speck*, less than the hundred-thousandth part of the whole of this vast abyss. If every drop of water can be divided into 26 millions of distinct

parts, as some philosophers have demonstrated,\* what an immense assemblage of watery particles must be contained in the unfathomable caverns of the ocean! Here the powers of calculation are completely set at defiance; and an image of infinity, immensity, and endless duration is presented to the mind. This mighty expanse of waters is the grand reservoir of nature, and the source of evaporation, which enriches the earth with fertility and verdure. Every cloud which floats in the atmosphere, and every fountain, and rivulet, and flowing stream, are indebted to this inexhaustible source for those watery treasures which they distribute through every region of the land. In fine, whether we consider the ocean as rearing its tremendous billows in the midst of the tempest, or as stretched out into a smooth expanse—whether we consider its immeasurable extent, its mighty movements, or the innumerable beings which glide through its rolling waves—we cannot but be struck with astonishment at the grandeur of that Omnipotent Being who holds its waters “in the hollow of his hand,” and who has said to its foaming surges, “Hitherto shalt thou come, and no farther, and here shall thy proud waves be stayed.”

**RIVERS.**—The next feature of the earth's surface which may be noticed, is, the rivers with which it is indented in every direction. These are exceedingly numerous, and seem to form as essential a part in the constitution of our globe, as the mountains from which they flow, and as the ocean to which they direct their course. It is reckoned, that in the old continent there are about 430 rivers which fall directly into the ocean, or into the Mediterranean and the Black seas; but in the new continent, there are only about 145 rivers known, which fall directly into the sea. In this enumeration, however, only the great rivers are included, such as the Thames, the Danube, the Volga, and the Rhone. Besides these, there are many thousands of streams of smaller dimensions, which, rising from the mountains, wind in every direction, till they fall into the large rivers, or are carried into the ocean. The largest rivers in Europe are—the Volga, which, rising in the northern parts of Russia, runs a course of 1700 miles, till it falls into the Caspian Sea—the Danube, whose course is 1300 miles, from the mountains of Switzerland to the Black Sea—and the Don, which runs a course of 1200 miles. The greatest rivers in Asia are—the Hoanbo, in China, whose course is 2400 miles—the Eoorhampooter, the Euphrates, and the Ganges. The longest river in Africa is the Nile, the course of which is estimated at 2000 miles. In the continent of America, the rivers appear

to be formed on the grandest scale, both as to the length of their course, and the vast body of waters which they pour into the ocean. The Amazon, the largest river in the world, runs a course of above 3000 miles across the continent of South America, till it falls into the Atlantic ocean, where it discharges a body of waters 150 miles in breadth. Next to this is the river St. Lawrence, which is more than 2400 miles from its mouth through the lake Ontario to the Lake Alempigo and the Assinibois; and the rivers La Plata and Mississippi, each of whose courses is not less than 2000 miles.

When we consider the number and the magnitude of these majestic streams, it is evident that an enormous mass of water is continually pouring into the ocean, from every direction. From observations which have been made on the river Po, which runs through Lombardy, and waters a tract of land 380 miles long and 120 broad, it is found, that it moves at the rate of four miles an hour, is 1000 feet broad, and 10 feet in depth, and, consequently, supplies the sea with 5068 millions of cubical feet of water in a day, or a cubical mile in 29 days. On the supposition that the quantity of water which the sea receives from the great rivers in all countries is proportional to the extent and surface of those countries, it will follow, that the quantity of waters carried to the sea by all the other rivers on the globe is 1083 times greater than that furnished by the Po, (supposing the land, as formerly stated, to contain about 49 millions of square miles,) and will supply the ocean with 13,630 cubical miles of water in a year. Now reckoning the ocean, as formerly, to contain 296 millions of cubical miles of water, this last number, divided by the former, will give a quotient of 21,716. Hence it appears, that, were the ocean completely drained of its waters, it would require more than *twenty thousand years*† before its caverns could be again completely filled by all the rivers in the world running into it at their present rate.

Here, two questions will naturally occur—Whence do the rivers receive so constant a supply of waters? and why has not the ocean long ago overflowed the world? since so prodigious a mass of water is continually flowing into its abyss. This was a difficulty which long puzzled philosophers; but it is now satisfactorily solved from a consideration of the effects of evaporation. By the heat of the sun the particles of water are drawn up into the atmosphere

\* The demonstration of this proposition may be seen in Nieuwentyt's Religious Philosopher, vol. III. p. 338.

† Buffon makes this result to be 812 years, in which he is followed by Goldsmith, and most subsequent writers; but he proceeds on the false assumption, that the ocean covers only half the surface of the globe, and that it contains only 25 millions of square miles, and he estimates the average depth of the ocean to be only 440 yards, or one-fourth of a mile.

from the surface of the ocean, and float in the air in the form of clouds or vapour. These vapours are carried, by the winds, over the surface of the land, and are again condensed into water on the tops and the sides of mountains, which, gliding down into their crevices and caverns, at length break out into springs, a number of which meeting in one common valley becomes a river; and many of these united together at length form such streams as the Tay, the Thames, the Danube, and the Rhine. That evaporation is sufficient to account for this effect, has been demonstrated by many experiments and calculations. It is found that, from the surface of the Mediterranean sea, which contains 762,000 square miles, there are drawn up into the air, every day, by evaporation, 5280 millions of tons of water, while the rivers which flow into it yield only 1827 millions of tons in the same time; so that there is raised in vapour from the Mediterranean nearly *three times* the quantity of water which is poured into it by all its rivers. One third of this falls into the sea before it reaches the land; another part falls on the low lands, for the nourishment of plants; and the other third part is quite sufficient to supply the sources of all the rivers which run into the sea. This is in full conformity to what was long ago stated by an inspired naturalist: "All the rivers run into the sea, and yet the sea is not full; unto the place from whence the rivers came, thither do they return again;" but, before they regain their former place, they make a circuit over our heads through the regions of the atmosphere.

Such are the varied movements and transformations which are incessantly going on in the rivers, the ocean and the atmosphere, in order to preserve the balance of nature, and to supply the necessities of the animal and the vegetable tribes; all under the agency and direction of Him who "formed the sea and the dry land," and who has arranged all things in number, weight, and measure, to subserve the purposes of his will.

Rivers serve many important purposes in the economy of our globe. They carry off the redundant waters which fall in rains, or which ooze from the springs, which might otherwise settle into stagnant pools; they supply to the seas the loss of waters occasioned by their daily evaporation; they cool the air and give it a gentle circulation; they fertilize the countries through which they flow; their waters afford a wholesome drink, and the fishes they contain a delicious food, for the nourishment of man; they facilitate commerce, by conveying the productions of nature and art from the inland countries to the sea; they form mechanical powers for driving machinery of different kinds; they enliven and diversify the scenery of the countries through which they pass; and the cataracts which they frequently form among the mountains

present us with scenes the most picturesque and sublime; so that every part of the constitution of nature is rendered subservient both to utility and to pleasure.

Waiving the consideration of other particulars, I shall simply state some of the artificial divisions of the earth, and two or three facts respecting its inhabitants.

The land has generally been divided into four parts, Europe, Asia, Africa, and America, to which has been lately added the division called Australasia, which comprehends New Holland, New Guinea, New Zealand, Van Dieman's land, and several other islands in the Pacific ocean. Europe comprehends the following countries, Norway, Sweden, Denmark, Russia, Prussia, Germany, Austria, Turkey, Italy, Switzerland, France, Holland, or the Netherlands, Spain, Portugal, and Great Britain and Ireland, together with the islands of Sicily, Malta, Candia, Corsica, Sardinia, Majorca, Minorca, Ivice, Zealand, Funen, Gothland, Iceland, and several others of smaller note.—Asia, the largest and most populous division of the ancient continent, contains the Empires of China and Japan, Chinese Tartary, Thibet, Hindostan, or British India, the Burman Empire, Persia, Arabia, Turkey in Asia, Siberia, Independent Tartary, and a variety of territories inhabited by tribes with which we are very imperfectly acquainted; together with the immense islands of Borneo, Sumatra, Java, Ceylon, Segalien, the Philippines, and thousands of others of smaller dimensions. It was in Asia where the human race was first planted; it became the nursery of the world after the universal deluge, and it was the scene in which the most memorable transactions recorded in the sacred history took place. But its inhabitants are now immersed in Mahometan and Pagan darkness; and the Christian religion, except in a few insulated spots, is almost unknown among its vast population. It is the richest and most fruitful part of the world, and produces cotton, silks, spices, tea, coffee, gold, silver, pearls, diamonds, and precious stones: but despotism, in its worst forms, reigns uncontrolled over every part of this immense region.

Africa comprehends the following kingdoms,—Morocco, Algiers, Tunis, Tripoli, Egypt, Zaira, Negroland, Guinea, Nubia, Abyssinia, Caffraria, Dahomey, Benin, Congo, Angola, and various other territories. By far the greater part of Africa remains hitherto unexplored, and, consequently, we are possessed of a very slender portion of information respecting the numerous tribes that may inhabit it. This quarter of the world, which once contained several flourishing kingdoms and states, is now reduced to a general state of barbarism. That most abominable traffic, the slave trade, is carried on to an unlimited extent on its eastern coasts, by a set of European ruffians, whose villanies are a dis-

ness to human nature. Its most striking features are those immense deserts, near its northern parts, which comprise nearly one-third of its surface. The deserts of Zaara are 1800 miles long, and 800 broad.

America is divided into North and South. It remained unknown to the inhabitants of the eastern hemisphere till the year 1492, when it was discovered by Columbus, who first landed on Guanahani, or Cat island, one of the Bahama Isles. North America comprehends the following countries: The United States, New and Old Mexico, Upper and Lower Canada, Nova Scotia, New Brunswick, and Labrador. South America comprehends the immense districts called Terra Firma, Peru, Guiana, Amazonia, Paraguay, Brazil, Chili, and Patagonia.—Between N. and S. America lie the islands of Cuba, St. Domingo, Jamaica, and Porto Rico, known by the name of the *West Indies*. Besides these, there are connected with America, the Bahama and Carribbee islands, Newfoundland, Cape Breton, Tobago, Trinidad, Terra del Fuego, &c. America is distinguished by its numerous and extensive lakes, which resemble large inland seas. Its rivers, also, form one of its grand and distinguishing features, being the largest on the globe. It is likewise diversified with lofty and extensive ranges of mountains. When first discovered it was almost wholly covered with immense forests, and thinly peopled with a number of savage tribes. Its mingled population of Aborigines and Europeans is now making rapid advances in knowledge, civilization, and commerce.

In regard to the human inhabitants that occupy the different regions now specified—they have been divided by some geographers into the six following classes—1. The dwarfish inhabitants of the polar regions; as the Laplanders, the Greenlanders, and the Esquimaux.—2. The flat-nosed olive-coloured tawny race; as the Tartars, the Chinese, and the Japanese.—3. The blacks of Asia with European features. Of this description are the Hindoos, the Burmans, and the inhabitants of the islands in the Indian ocean.—4. The woolly-haired negroes of Africa, distinguished by their black colour, their flat noses, and their thick lips.—5. The copper-coloured native Americans, distinguished likewise by their black hair, small black eyes, high cheek-bones, and flat noses.—6. The sixth variety is the white European nations, as the British, the French, the Italians, and the Germans.

The number of inhabitants which people the earth at one time may be estimated to amount to at least eight hundred millions; of which 500 millions may be assigned to Asia; 80 millions to Africa; 70 millions to America; and 150 millions to Europe.—With regard to their religion, they may be estimated as follows:

Pagans,	.	.	.	.	400,000,000
Mahometans,	.	.	.	.	120,000,000
Roman Catholics,	.	.	.	.	100,000,000
Protestants,	.	.	.	.	40,000,000
Greeks and Arminians,	.	.	.	.	20,000,000
Jews,	.	.	.	.	7,000,000
					<hr/>
					880,000,000

From this estimate it appears, that there are more than four Pagans and Mahometans to one Christian, and only one Protestant to 17 of all the other denominations. Although all the Roman Catholics, Greeks, and Protestants were reckoned true Christians, there still remain more than 620 millions of our fellow men ignorant of the true God, and of his will as revealed in the Sacred Scriptures; which shows what a vast field of exertion still lies open to Christian benevolence, before the blessings of civilization, mental improvement, rational liberty, and Christianity be fully communicated to the Pagan and Mahometan world.

If we suppose that the earth, at an average, has always been as populous as it is now, and that it contains 800 millions of inhabitants, as above stated, and if we reckon 32 years for a generation, at the end of which period the whole human race is renewed; it will follow, that 145 thousand millions of human beings have existed on the earth since the present system of our globe commenced, reckoning 5889 years from Adam to the present time.\* And, consequently, if mankind had never died, there would have been 182 times the present number of the earth's inhabitants now in existence. It follows from this statement, that 25 millions of mankind die every year, 2853 every hour, and 47 every minute, and that at least an equal number, during these periods, are emerging from non-existence to the stage of life; so that almost every moment, a rational and immortal being is ushered into the world, and another is transported to the invisible state. Whether, therefore, we contemplate the world of matter, or the world of mind, we perceive incessant changes and revolutions going on, which are gradually carrying forward the earth and its inhabitants to some important consummation.—If we suppose that, before the close of time,

\* This calculation proceeds on the supposition, that only 4004 years elapsed between the Mosaic creation and the birth of Christ, according to the Hebrew chronology. But Dr. Hales, in his late work on Scripture chronology, has proved, almost to a demonstration, that, from the creation to the birth of Christ are to be reckoned 5411 years; and this computation nearly agrees with the Samaritan and Septuagint chronology, and with that of Josephus. According to this computation, 7235 years are to be reckoned from the creation to the present time; and, consequently, 230 thousand millions of human beings will have existed since the creation which is more than 23 times the number of inhabitants presently existing.

as many human beings will be brought into existence, as have already existed, during the by-past ages of the world, there will, of course, be found, at the general resurrection, 290,000,000,000 of mankind. Vast as such an assemblage would be, the whole of the human beings here supposed, allowing six square feet for every individual, could be assembled within the space of 62,400 square miles, or on a tract of land not much larger than that of England, which contains, according to the most accurate calculations, above 50,000 square miles.

Our world is capable of sustaining a much greater number of inhabitants than has ever yet existed upon it at any one time. And since we are informed in the Sacred Oracles, that God "created it not in vain, but *formed it to be inhabited*," we have reason to believe, that, in future ages, when the physical and moral energies of mankind shall be fully exerted, and when Peace shall wave her olive branch over the nations, the earth will be much more populous than it has ever been, and those immense deserts, where ravenous animals now roam undisturbed, will be transformed into scenes of fertility and beauty. If it be admitted, that the produce of twelve acres of land is sufficient to maintain a family consisting of six persons, and if we reckon only one-fourth of the surface of the globe capable of cultivation, it can be proved, that the earth could afford sustenance for 16,000 millions of inhabitants, or *twenty times the number* that is presently supposed to exist. So that we have no reason to fear that the world will be overstocked with inhabitants for many ages to come; or that a period may soon arrive when the increase of population will surpass the means of subsistence, as some of the disciples of Malthus have lately insinuated. To suppose, as some of these gentlemen seem to do, that wars and diseases, poverty and pestilence, are necessary evils, in order to prevent the increase of the human race beyond the means of subsistence which nature can afford—while the immense regions of New Holland, New Guinea, Borneo, and the greater part of Africa and America are almost destitute of inhabitants—is both an insult on the dignity of human nature, and a reflection on the wisdom and beneficence of Divine Providence. The Creator is benevolent and bountiful, and "his tender mercies are over all his works;" but man, by his tyranny, ambition, and selfishness, has counteracted the streams of Divine beneficence, and introduced into the social state poverty, disorder, and misery, with all their attendant train of evils; and it is not before such demoralizing principles be in some measure eradicated, and the principles of Christian benevolence brought into active operation, that the social state of man will be greatly meliorated, and the bounties of heaven fully enjoyed by the human race. If, in the pre-

sent deranged state of the social and political world, it be found difficult, in any particular country, to find sustenance for its inhabitants, emigration is the obvious and natural remedy and the rapid emigrations which are now taking place to the Cape of Good Hope, New Holland, Van Dieman's Land, and America, are, doubtless, a part of those arrangements of Providence, by which the Creator will accomplish his designs, in peopling the desolate wastes of our globe, and promoting the progress of knowledge and of the true religion among the scattered tribes of mankind.

---

With that branch of knowledge to which I have now adverted, every individual of the human race ought to be, in some measure, acquainted. For it is unworthy of the dignity of a rational being, to stalk abroad on the surface of the earth, and enjoy the bounty of his Creator, without considering the nature and extent of his sublunary habitation, the variety of august objects it contains, the relation in which he stands to other tribes of intelligent agents, and the wonderful machinery which is in constant operation for supplying his wants, and for producing the revolutions of day and night, spring and autumn, summer and winter. In a religious point of view, geography is a science of peculiar interest. For "the salvation of God," which Christianity unfolds, is destined to be proclaimed in every land, in order that men of all nations and kindreds and tongues may participate in its blessings. But, without exploring every region of the earth, and the numerous islands which are scattered over the surface of the ocean, and opening up a regular intercourse with the different tribes of human beings which dwell upon its surface, we can never carry into effect the purpose of God, by "making known his salvation to the ends of the earth." As God has ordained, that "all flesh shall see the salvation" he has accomplished, and that human beings shall be the agents for carrying his designs into effect—so we may rest assured that he has ordained every mean requisite for accomplishing this end; and, consequently, that it is his will that men should study the figure and magnitude of the earth, and all those arts by which they may be enabled to traverse and explore the different regions of land and water, which compose the terraqueous globe—and that it is also his will, that every one who feels an interest in the present and eternal happiness of his fellow men, should make himself acquainted with the result of all the discoveries in this science that have been, or may yet be made, in order to stimulate his activity, in conveying to the wretched sons of Adam, wherever they may be found, "the unsearchable riches of Christ."

To the missionary, and the directors of Bible and Missionary Societies, a minute and comprehensive knowledge of the science, and of all the facts connected with it, is essentially requisite; without which they would often grope in the dark, and spend their money in vain, and "their labour for that which doth not profit." They must be intimately acquainted with the extensive field of operation which lies before them, and with the physical, the moral, and the political state of the different tribes to which they intend to send the message of salvation; otherwise their exertions will be made at random, and their schemes be conducted without judgment or discrimination. To attempt to direct the movements of Missionary Societies, without an intimate knowledge of this subject, is as foolish and absurd as it would be for a land surveyor to lay down plans for the improvement of a gentleman's estate, before he had surveyed the premises, and made himself acquainted with the objects upon them, in their various aspects, positions, and bearings. If all those who direct and support the operations of such societies, were familiarly acquainted with the different fields for missionary exertions, and with the peculiar state and character of the diversified tribes of the heathen world, so far as they are known, injudicious schemes might be frustrated before they are carried into effect, and the funds of such institutions preserved from being wasted to no purpose. In this view, it is the duty of every Christian, to mark the progress and results of the various geographical expeditions which are now going forward in quest of discoveries, in connexion with the moral and political movements which are presently agitating the nations: for every navigator who ploughs the ocean in search of new islands and continents, and every traveller who explores the interior of unknown countries, should be considered as so many pioneers, sent beforehand, by Divine Providence, to prepare the way for the labours of the missionary, and for the combined exertions of Christian benevolence.\*

\* On this subject the author feels great pleasure in referring his readers to a small volume, lately published, by James Douglas, Esq. of Cavers, entitled, "Hints on Missions,"—a work which deserves the attentive perusal, both of the philosopher, the politician, and the Christian, and particularly of the directors of Missionary Societies; and which is characterized by a spirit of enlightened philanthropy, and a *condensation of thought*, which has seldom been equalled in the discussion of such topics. It concentrates, as it were, into a focus, the light which has been reflected from hundreds of volumes; and the original hints it suggests claim the serious consideration of the superintendents of missionary schemes; without an attention to some of which, the beneficial effects resulting from such undertakings will be few and unimportant. Should this note happen to strike the eye of the worthy author, it is submitted, with all due deference, whether a more extensive circulation of the substance of this volume, in a less expensive form, and with a few modifications, to bring it within the range of thought

But even to every private Christian, geography is an interesting branch of study, without some knowledge of which his prayers and his Christian sympathies cannot be judiciously and extensively directed. We occasionally hear the ministers of religion, at the commencement of public worship, on the first day of the week, imploring the Divine blessing on their brethren throughout the Christian church, who are commencing the same exercises; and at the close of worship in the afternoon, that the same blessing may seal the instructions which have been delivered in all the churches of the saints; as if all the public religious services of the universal church were, at that moment, drawing to a close. This is all very well, so far as it goes: the expression of such benevolent wishes is highly becoming, and congenial to the spirit of Christianity. But a very slight acquaintance with geographical science will teach us, that, when we in this country are commencing the religious services of the first day of the week, our Christian brethren in the East Indies, who live under a very different meridian, have finished theirs; those in Russia, Poland, Greece, Palestine, and on the banks of the Caspian sea, have performed one-half of their public religious worship and instructions; and those in New Holland and Van Diemen's Land have retired to rest, at the close of their Sabbath. On the other hand, our friends in the West India islands and in America, at the close of our worship, are only about to commence the public instructions of the Christian Sabbath. If, then, it be submitted, that our prayers, in certain cases, ought to be specific, to have a reference to the particular cases and relations of certain classes of individuals, there can be no valid reason assigned, why they should not have a reference to the geographical positions of the different portions of the Christian church, as well as to those who live on or near our own meridian: that, for example, in the beginning of our public devotions, we might implore that the blessing of God may accompany the instructions which have been delivered in the eastern parts of the world; and at the close of worship, that the same agency may direct in the exercises of those in the western hemisphere, who are about to enter on the sacred services of that day. On the same principle, we may perceive the absurdity of those "concerts"† for prayer in different places at the

possessed by general readers, would not have a tendency to promote its benevolent objects.

† The author does not seem to mean, that it is absurd for Christians in every part of the earth to assemble on the same day in their respective places of devotion, to pray for a universal extension of Christianity. This objection would lie with equal weight against the Sabbath. His only objection appears to be against the *supposition*, that Christians, meeting in different parts of the earth at the same hour of the day, are praying in all places at the same moment.—*American Editor.*

same hour, which were lately proposed, and attempted by a certain portion of the religious world. Even within the limits of Europe, this could not be attempted, with the prospect of Christians joining in devotion at one and the same time; for, when it is six o'clock in one part of Europe, it is eight at another, and five o'clock at a third place; much less could such a concert take place throughout Europe, Asia, and America. So that science, and a calm consideration of the nature and relations of things, may teach us to preserve our devotional fervour and zeal within the bounds of reason and propriety; and, at the same time, to direct our reflections, and our Christian sympathies, to take a wider range than that to which they are usually confined.

Besides the considerations now suggested, a serious contemplation of the physical objects and movements which this science exhibits, has a tendency to excite pious and reverential emotions. To contemplate this huge globe of land and water, flying with rapidity through the voids of space, conveying its vast population from one region to another at the rate of fifteen hundred thousand miles in a day, and whirling round its axis at the same time, to produce the constant succession of day and night,—to contemplate the lofty ridges of mountains that stretch around it in every direction; the flaming volcanoes; the roaring cataracts; the numerous rivers, incessantly rolling their watery treasures into the seas; the majestic ocean, and its unfathomable caverns; the vapours rising from its surface, and replenishing the springs and rivers; the avalanche hurling down the mountain's side with a noise like thunder; the luxuriant plains of the torrid zone; the rugged cliffs and icebergs of the polar regions; and thousands of other objects of diversified beauty and sublimity,—has an evident tendency to expand the conceptions of the human mind, to increase its sources of animal enjoyment, and to elevate the affections to that all-powerful Being who gave birth to all the sublimities of Nature, and who incessantly superintends all its movements.

In fine, from the numerous moral facts, which geography unfolds, we learn the vast depth and extent of that moral degradation into which the human race has fallen—the ferocious tempers, and immoral practices, which are displayed in the regions of pagan idolatry—the horrid cruelties, the vile abominations, that are daily perpetrated under the sanction of what is termed religion—the wide extent of population, over which the prince of darkness sways his sceptre—the difficulties which require to be surmounted before the “gospel of salvation” can extend its full influence throughout the pagan world—and the vast energies which are requisite to accomplish this glorious event. All these portions of information are calculated to confirm

and illustrate the scriptural doctrine of the universal depravity of man—to exercise the faith of the Christian, on the promises of Jehovah, in reference to the conversion of the benighted nations—to rouse his sympathies towards his degraded brethren of mankind, to excite his intercession in their behalf, and to direct his benevolence and activity in devising and executing schemes for enlightening the people who are sitting “in darkness, and in the shadow of death.”

## GEOLOGY.

Another subject intimately related to the former, is the science of Geology.

This science has for its object, to investigate and describe the internal structure of the earth, the arrangement of the materials of which it is composed, the circumstances peculiar to its original formation, the different states under which it has existed, and the various changes which it appears to have undergone, since the Almighty created the substance of which it is composed. From a consideration of the vast quantity of materials contained in the internal structure of our globe, and of the limited extent to which men can carry their operations, when they attempt to penetrate into its bowels, it is obvious, that our knowledge of this subject must be very shallow and imperfect. The observations, however, which have been made on the structure of our globe during the last half century, and the conclusions deduced from them, are highly interesting, both to the philosopher and to the Christian. Before the facts, on which this branch of natural history is founded, were accurately ascertained, a variety of objections to the Mosaic history of the creation were started by certain skeptical philosophers, founded on partial and erroneous views of the real structure and economy of the earth. But it is now found, that the more accurately and minutely the system of nature is explored, the more distinctly do we perceive the harmony that subsists between the records of Revelation, and the operations of the Creator in the material world. If both be admitted as the effects of the agency of the same Almighty and Eternal Being, they must, in the nature of things, completely harmonize, and can never be repugnant to each other—whether we be capable, in every instance, of perceiving their complete coincidence, or not. If any facts could be produced in the visible creation which directly contradict the records of the Bible, it would form a proof, that the oracles which we hold as divine were not dictated by the Creator and Governor of the universe. But, although some garbled facts have been triumphantly exhibited in this view, it is now ascertained, from the discoveries which have been lately made in relation to the structure and formation of the earth, that the truth of the facts de-

tailed in sacred history rests on a solid and immutable basis; and that the Supreme Intelligence who arranged the fabric of heaven and earth, and he alone, communicated to the inspired writers the doctrines and the facts they have recorded; and we have reason to believe, that, as geologists proceed in their researches and investigations, still more sensible proofs of the authenticity of Revelation will be brought to light.

Geology has, of late, become an interesting object of inquiry to the student of general science, and is now prosecuted with ardour by many distinguished philosophers. The observations which have been made in various parts of the world, by late navigators; the facts which have been ascertained by Pallas, Saussure, De Luc, Humboldt, and other intelligent travellers; and the discoveries which have been brought to light by modern chymists and mineralogists, have all conspired to facilitate geological inquiries, to render them more enlightened and satisfactory, and to prepare the way for future ages establishing a rational, scriptural, and substantial theory of the earth. The man who engages in such inquiries has always at hand a source of rational investigation and enjoyment. The ground on which he treads—the aspect of the surrounding country—the mines, the caves, and the quarries which he explores—every new country in which he travels, every mountain he climbs, and every new surface of the earth that is laid open to his inspection, offer to him novel and interesting stores of information. On descending into mines, we are not only gratified by displays of human ingenuity, but we also acquire views of the strata of the earth, and of the revolutions it has undergone since the period of its formation. Our researches on the surface of the earth, amidst abrupt precipices and lofty mountains, introduce us to the grandest and most sublime works of the Creator, and present to our view the effects of stupendous forces, which have overturned mountains, and rent the foundations of nature. “In the midst of such scenes, the geologist feels his mind invigorated; the magnitude of the appearances before him extinguishes all the little and contracted notions he may have formed in the closet; and he learns, that it is only by visiting and studying those stupendous works, that he can form an adequate conception of the great relations of the crust of the globe, and of its mode of formation.”\*

The upper crust, or surface of the earth, is found to be composed of different *strata*, or beds placed one above another. These strata, or layers, are very much mixed, and their direction, matter, thickness, and relative position, vary considerably in different places. These strata are divided into seven classes, as follows:—black earth, clay, sandy earth, marl, bog, chalk,

and scabrous or stony earth. The surface of the globe, considered in relation to its inequalities, is divided into highland, lowland, and the bottom of the sea. Highland comprises Alpine land, composed of mountain groups, or series of mountain chains: lowland comprises those extensive flat tracts which are almost entirely destitute of small mountain groups. To the bottom of the sea belong the flat, rocky bottom, shoals, reefs, and islands.

At first sight, the solid mass of the earth appears to be a confused assemblage of rocky masses, piled on each other without regularity or order, where none of those admirable displays of skill and contrivance are to be observed, which so powerfully excite attention in the structure of animals and vegetables. But, on a nearer and more intimate view, a variety of beautiful arrangements has been traced by the industry of geologists, and the light of modern discoveries; by which they have been enabled to classify these apparent irregularities of nature. The materials of which the solid crust of the earth is composed, have been arranged into the four following classes:—1. Those rocks which contain neither any animal nor vegetable remains themselves, nor are intermixed with rocks which do contain them, and are therefore termed *primitive*, or *primary* rocks; the period of whose formation is considered as antecedent to that of the creation of organic beings. These are granite, gneiss, mica slate, and clay slate, which occur abundantly in all regions of the globe, with quartz rock, serpentine, granular limestone, &c. which occur more sparingly. 2. Rocks containing organic remains, or generally associated with other rocks in which such substances are found, and which, as having been formed posterior to the existence of organized beings, are termed *secondary*. These are greywacke, sandstone, limestone, and gypsum of various kinds, slate clay, with certain species of trap, and they are found lying above the primary or older rocks. 3. Above these secondary rocks, beds of gravel, sand, earth, and moss are found, which have been termed *alluvial* rocks or *formations*. This class comprehends those rocky substances formed from previously existing rocks, of which the materials have been broken down by the agency of water and air; they are therefore generally loose in their texture, and are never covered with any real solid and rocky secondary strata. 4. *Volcanic* rocks; under which class are comprehended all those rocks, beds of lava, scorim, and other matter, thrown out at certain points of the earth's surface by the action of subterraneous fire.

“The phenomena of geology show, that the original formation of the rocks has been accompanied, in nearly all its stages, by a process of waste, decay, and recomposition. The rocks as they were successively deposited, were acted

\* Edinburgh Encyclop. Art. Mineralogy.

upon by air and water, heat, &c. broken into fragments, or worn down into grains, out of which new strata were formed. Even the newer secondary rocks, since their consolidation, have been subject to great changes, of which very distinct monuments remain. Thus, we have single mountains which, from their structure, can be considered only as remnants of great formations, or of great continents no longer in existence. Mount Meisner, in Hesse, six miles long and three broad, rises about 1800 feet above its base, and 2100 above the sea, overtopping all the neighbouring hills from 40 to 50 miles round. The lowest part of the mountain consists of the same shell, limestone, and sandstone, which exist in the adjacent country. Above these are, first, a bed of sand, then a bed of fossil wood, 100 feet thick at some points, and the whole is covered by a mass of basalt, 500 feet in height. On considering these facts, it is impossible to avoid concluding, that this mountain which now overtops the neighbouring country, occupied at one time, the bottom of a cavity in the midst of higher lands. The vast mass of fossil wood could not all have grown there, but must have been transported by water from a more elevated surface, and lodged in what was then a hollow. The basalt which covers the wood must also have flowed in a current from a higher site; but the soil over which both the wood and the basalt passed, has been swept away leaving this mountain as a solitary memorial to attest its existence. Thus, also, on the side of Mount Jura next the Alps, where no other mountain interposes, there are found vast blocks of granite (some of 1000 cubic yards) at the height of more than 2000 feet above the lake of Geneva. These blocks are foreign to the rocks among which they lie, and have evidently come from the opposite chain of the Alps; but the land which constituted the inclined plane over which they were rolled or transported, has been worn away, and the valley of lower Switzerland, with its lakes, now occupies its place. Transported masses of primitive rocks, of the same description, are found scattered over the north of Germany, which Van Buch ascertained by their characters to belong to the mountains of Scandinavia; and which, therefore, carry us back to a period when an elevated continent, occupying the basin of the Baltic, connected Saxony with Norway.—*Supp. to Ency. Brit.* vol. 6.

The production of a bed for vegetation is effected by the decomposition of rocks. This decomposition is effected by the expansion of water in the pores or fissures of rocks, by heat or congelation—by the solvent power of moisture—and by electricity, which is known to be a powerful agent of decomposition. As soon as the rock begins to be softened, the seeds of lichens, which are constantly floating in the air, make it their

resting place. Their generations occupy it till a finely divided earth is formed, which becomes capable of supporting mosses and heath; acted upon by light and heat, these plants imbibe the dew, and convert constituent parts of the air into nourishment. Their death and decay afford food for a more perfect species of vegetable; and, at length, a mould is formed, in which even the trees of the forest can fix their roots, and which is capable of rewarding the labours of the cultivator. The decomposition of rocks tends to the renovation of soils, as well as their cultivation. Finely divided matter is carried by rivers from the higher districts to the low countries, and alluvial lands are usually extremely fertile. By these operations, the quantity of habitable surface is constantly increased; precipitous cliffs are generally made gentle slopes, lakes are filled up, and islands are formed at the mouths of great rivers; so that as the world grows older, its capacity for containing an increased number of inhabitants is gradually enlarging.

Of all the memorials of the past history of our globe, the most interesting are those myriads of remains of organized bodies which exist in the interior of its outer crusts. In these, we find traces of innumerable orders of beings existing under different circumstances, succeeding one another at distant epochs, and varying through multiplied changes of form. "If we examine the secondary rocks, beginning with the most ancient, the first organic remains which present themselves, are those of aquatic plants and large reeds, but of species different from ours. To these succeed madrepores, encrinities, and other aquatic zoophytes, living beings of the simplest forms, which remain attached to one spot, and partake, in some degree, of the nature of vegetables. Posterior to these, are ammonites, and other mollusci, still very simple in their forms, and entirely different from any animals now known. After these, some fishes appear; and plants, consisting of bamboos and ferns, increase, but still different from those which exist. In the next period, along with an increasing number of extinct species of shells and fishes, we meet with amphibious and viviparous quadrupeds, such as crocodiles and tortoises, and some reptiles, as serpents, which show that dry land now existed. As we approach the newest of the solid rock formations, we find lamantins, phocæ, and other cetaceous and mammiferous sea animals, with some birds. And in the newest of these formations, we find the remains of herbiferous land animals of extinct species, the palæotherium, anaplotherium, &c. and of birds, with some fresh water shells. In the lowest beds of loose soil, and in peat bogs, are found the remains of the elephant, rhinoceros, hippopotamus, elk, &c. of different species from those which now exist, but belonging to the same genera. Lastly, the bones of the species which are apparently the same

with those now existing alive, are never found except in the very latest alluvial depositions, or those which are either formed in the sides of rivers, the bottoms of ancient lakes and marshes now dried up, in peat beds, in the fissures and caverns of certain rocks, or at small depths below the present surface, in places where they may have been overwhelmed by debris, or even buried by man. Human bones are never found except among those of animal species now living, and in situations which show, that they have been, comparatively speaking, recently deposited."—*Supp. to Ency. Brit.* vol. 6.

More than thirty different species of animals have been found imbedded in the secondary strata—no living examples of which are now to be found in any quarter of the globe. Among the most remarkable of these are the following.—

1. The *Mammoth*, which bears a certain resemblance to the Elephant, but is much larger, and differs considerably in the size and form of the tusks, jaws, and grinders. The fossil remains of this animal are more abundant in Siberia than in other countries; there being scarcely a spot, from the river Don to Kamtschatka, in which they have not been found. Not only single bones and perfect skeletons of this animal are frequently to be met with; but, in a late instance, the whole animal was found preserved in ice. This animal was discovered on the banks of the frozen ocean, near the mouth of the river Jena, in 1799; and in 1806, Mr. Adams got it conveyed over a space of 7000 miles to Petersburg, where it is deposited in the Museum. The flesh, skin, and hair were completely preserved, and even the eyes were entire. It was provided with a long mane, and the body was covered with hair. This hair was of different qualities. There were stiff black bristles from 12 to 15 inches long, and these belonged to the tail, mane, and ears. Other bristles were from 9 to 10 inches long, and of a brown colour; and besides these, there was a coarse wool, from 3 to 5 inches long, of a pale yellow colour. This mammoth was a male: it measured 9 feet 4 inches in height, and was 16 feet 4 inches long without including the tusks. The tusks, measuring along the curve, are 9 feet 6 inches; and the two together weigh 360 lbs. avoirdupois. The head alone without the tusks, weighs 414 lbs. avoirdupois. The remains of this animal have been found likewise in Iceland, Norway, Scotland, England, and in many places through the continent onwards to the Arctic ocean.

2. The *Megatherium*. A complete skeleton of this colossal species was found in diluvial soil, near Buenos Ayres, and sent to Madrid. The specimen is 14 feet long, and 7 Spanish feet in height.

3. The great *Mastodon* of the Ohio. This species appears to have been as tall as the elephant, but with longer and thicker limbs. It had

tusks like the elephant, and appears to have lived on roots. Its remains abound in America, particularly on the banks of the Ohio.

4. The *Tapir*, which also abounds in America. The one named *Gigantic Tapir*, is about 18 feet long, and 12 feet high.

5. The *Irish Elk*, or Elk of the Isle of Man. This gigantic species, now apparently extinct, occurs in a fossil state, in Ireland, Isle of Man, England, Germany, and France. The most perfect specimen of this species, which was found in the Isle of Man, may be seen in the Museum of the University of Edinburgh. It is 6 feet high, 9 feet long, and in height to the tip of the right horn, 9 feet 7½ inches. An engraving of this skeleton may be seen in vol. 6 of *Supp. to Ency. Brit.*

From a consideration of the phenomena above described, geologists have been led to conclude, "that rocks now buried at a great depth, constituted, at one time, the surface of continents, and the seat of organic life; and that many orders of beings have been called into existence, and afterwards destroyed by great revolutions, which introduced new classes of mineral deposits, accompanied with new tribes of organic beings." It has also been concluded by some, that the appearance of man upon the face of the globe, is, geologically speaking, a very recent event; before which the earth had been inhabited thousands of years by various families of plants and tribes of animals, which had been destroyed and renewed in a long series of successions. Whether these conclusions be *necessary inferences* from the phenomena of organic remains and other geological facts, I shall not, at present, stop to inquire. It is sufficient for the Christian philosopher to show, that though they should be admitted in their full extent, they are not inconsistent with the records of sacred history, as some divines have been disposed to maintain. Though it could be proved to a demonstration, that the *materials* of which the present system of our globe is composed, have existed for millions of years, it would not, in the least, invalidate the Mosaic account of the arrangement of our world. For Moses nowhere affirms, that the *materials* or *substances* of the earth were created, or brought from nothing into existence, *at the period* when his history commences. His language, on the contrary, evidently implies, that the materials which enter into the constitution of our globe *did exist*, at the epoch at which he commences his narration. "The earth was without form, and void; and darkness was upon the face of the deep." This passage plainly implies the following things—1. That the original atoms, or materials, out of which the terraqueous globe, in its present state, was formed, were then in existence, or had been previously created. *How long* they had been in existence is not stated. We may suppose them to have existed for a

year, a thousand years, or a million of years, just as geological phenomena seem to warrant, without in the least invalidating the authority of the sacred historian, who states nothing contrary to the truth of either supposition. 2. That the materials of our globe, as then existing, were in a *chaotic* state. Instead of that order and beauty which we perceive on the face of nature, the whole mass presented a scene of confusion and disorder—such a scene, perhaps, as would be presented, were the earth stripped of its verdure, were its strata universally disrupted, its mountains hurled into the plains, and its rivers and seas, by some terrible convulsion, to forsake their ancient channels. 3. The passage seems to imply, that the whole, or the greater portion of the earth, as it then existed, was covered with a deluge of water: “Darkness covered the face of the deep,” or the *abyss*.

Such was the state of the terrestrial system at the period when Moses commences his narration; no intimation being given of the period of its duration in this condition; and, consequently, nothing asserted to militate against any geological system which is founded on the facts which have been discovered respecting the organic remains which are found in the strata of our globe. It is a mistake into which too many have been apt to fall, to suppose, that Moses begins his history at the period when the first portions of material existence were created out of nothing; and that it was his design to mark the precise epoch when the whole assemblage of created beings throughout the universe was brought into existence. His primary, if not his sole intention evidently was, to detail the progress of those arrangements by which the earth was gradually reduced to that form and order in which we now behold it, from the chaotic materials which previously existed. And, as an emphatic and appropriate introduction to his narration, he states this important truth: “In the beginning God created the heaven and the earth.” This passage, being of a general and comprehensive nature, decides nothing with regard to the period, or precise epoch, at which the different bodies in the universe were called into being; but is evidently intended to convey the following important truth, in opposition to all fanciful, chimerical, and atheistical notions respecting the origin of the world; namely, “That, at what period soever, in the lapse of duration, any object was brought into existence, it derived that existence from the God of Israel, the self-existent and eternal Jehovah.”—“In the beginning God created the heaven and the earth.” As the language of the sacred historian, therefore, decides nothing with regard to time—to limit the creation of every portion of the material system within the period of six thousand years, is to make an unnecessary concession to the infidel philosopher, which may afterwards be found inconsistent

with certain facts which exist in the material world.

But, whatever may be said with respect to the state and duration of the earth prior to the period at which Moses commences his narration, it is admitted by every geologist, that our globe, as to its present form and arrangement, has been, comparatively, of but short duration. Cuvier, one of the most enlightened geologists of the age, deduces, from certain progressive changes on the earth's surface, as well as from the concurrent traditions of many nations, that the first appearance of man upon the face of the globe, or, at least, the renewal of the human race after some great catastrophe, cannot be referred to a period farther back than 5000 or 6000 years from the present time. Geologists, too, of every description, however different the systems or theories they have adopted, have all been constrained, from the evidence of fact, to admit this conclusion, “*That every part of the dry land was once covered by the ocean;*” thus confirming the scriptural account of that stupendous event, the *universal deluge*. This event, from its very nature, must have been accompanied with the most terrible convulsions, both on the exterior surface, and in the interior strata of the globe. Accordingly we find, that traces of this awful catastrophe exist in every region of the earth. Mr. Parkinson describes the whole island of Great Britain, as having, since its completion, “suffered considerable disturbance from some prodigious and mysterious power. By this power all the known strata, to the greatest depths that have been explored, have been more or less broken and displaced, and, in some places, have been so lifted, that some of the lowest of them have been raised to the surface; while portions of others, to a very considerable depth and extent, have been entirely carried away.” The whole of the Alpine region in Switzerland, and the north of Italy, considered as one mass, shows the most evident marks of dislocation. At the height of 3500 feet above the level of the sea, M. Saussure met with a chasm a hundred feet wide, and so deep that he saw no bottom. All travellers on the Alps have regarded them with horror. They mark the most evident convulsions, but show no signs of having been occasioned by attrition. Mr. Townsend, speaking of the Pyrenees, which he personally inspected, says, “What is most remarkable is, to see four enormous chasms, almost perpendicular, which divided both mountains and their valleys, and which appear as if they had just been rent asunder.” Throughout the ranges of the Andes, and in every other mountainous region, similar chasms and disruptions, indicating the former operation of some tremendous power, are frequently observed by those who visit such scenes of grandeur.—In some of the coal mines in our country, the coal is in some places lifted up or

thrown down several hundreds of feet from the places it appears originally to have occupied. "Two miles north of Newcastle," says Mr. Townsend, "one great *dyke* or *fault* throws down the coal 540 feet—at the distance of 3 miles it is cut off, and thrown down again 240 feet."

An evidence of the effects which could be produced only by a general deluge, is also afforded by those organic remains to which I have already adverted, and particularly by those immense quantities of *marine shells*, which have been discovered in situations so elevated, and in places so far removed from the sea, as to prove that they were left there by a flood extending over the whole globe. At Touraine, in France, a hundred miles from the sea, is a bed of shells stretching 9 leagues in extent, and 20 feet in depth, and including shells not known to belong to the neighbouring sea. Humboldt found sea shells on the Andes at an elevation of 14,120 feet above the level of the sea. The stony mountain of La Bolla, near Verona, is famous for petrifications, among which are enumerated more than one hundred species of fish, natives of Europe, Asia, Africa, and America, *here assembled in one place*.

It appears, therefore, that the researches of geology confirm the fact of a universal deluge, and thus afford a *sensible* proof of the credibility of the sacred historian, and, consequently, of the truth of the doctrines of Divine Revelation. But, besides the testimony which this science bears to the authenticity of Scripture History, it exhibits some of the grandest objects in the history of the physical operations of Divine Providence. It presents to our view, in a most impressive form, the majestic agency of God, in convulsing and disarranging the structure of our globe, which at first sprung from his hand in perfect order and beauty. When we contemplate the objects which this science embraces, we seem to be standing on the ruins of a former world. We behold "hills" which "have melted like wax at the presence of the Lord," and "mountains" which "have been carried into the midst of the sea." We behold rocks of enormous size, which have been rent from their foundations, and rolled from one continent to another—the most solid strata of the earth bent under the action of some tremendous power, and dispersed in fragments through the surrounding regions. We behold the summits of lofty mountains, over which the ocean had rolled its mighty billows—confounding lands and seas in one universal devastation—transporting plants and forests from one quarter of the world to another, and spreading universal destruction among the animated inhabitants of the water and the earth. When we enter the wild and romantic scene of a mountainous country, or descend into the subterraneous regions of the globe, we are every where struck with the vestiges of opera-

tions carried on by the powers of nature, upon a scale of prodigious magnitude, and with the exertion of forces, the stupendous nature of which astonishes and overpowers the mind. Contemplating such scenes of grandeur, we perceive the force and sublimity of those descriptions of Deity contained in the volume of inspiration: "The Lord reigneth, he is clothed with majesty; in his hand are the deep places of the earth, the strength of the hills is his also. He removeth the mountains, and they know not; he overturneth them in his anger; he shaketh the earth out of her place, and the pillars thereof tremble. At his presence the earth shook and trembled: the foundations also of the hills moved, and were shaken, because he was wrath."—"Thou coveredst the earth with the deep, as with a garment; the waters stood above the mountains. At thy rebuke they fled; at the voice of thy thunder they hastened away." While retracing such terrific displays of omnipotence, we are naturally led to inquire into the *moral* cause which induced the benevolent Creator to inflict upon the world such overwhelming desolations. For reason, as well as revelation, declares that a *moral* cause must have existed. Man must have violated the commands of his Maker, and frustrated the end of his creation; and to this conclusion the sacred historian bears ample testimony.—"God saw that the wickedness of man was great in the earth, and that every imagination of the thoughts of his heart was only evil continually; and Jehovah said, I will destroy man whom I have created, from the face of the earth, both man and beast, and the creeping thing, and the fowls of the air."

#### ASTRONOMY.

Another science which stands in an intimate relation to religion, is Astronomy.

This sublime science teaches us the magnitudes and distances of the heavenly bodies, their arrangement, their various motions and phenomena, and the laws by which their movements are regulated. It presents to our view objects the most wonderful and sublime; whether we consider the *vast magnitude* of the bodies about which it is conversant—their immense number—the velocity of their motions—the *astonishing forces* requisite to impel them in their rapid career through the regions of the sky—the *vast spaces* which surround them, and in which they perform their revolutions—the *magnificent circles* they describe—the *splendour* of their appearance—or the *important ends* they are destined to serve in the grand system of the universe. Having adverted to this subject, when illustrating the omnipotence of the Deity, I shall here simply state a few additional facts with respect to the general appearance of the heavens, the bodies which compose the planetary system, and the discoveries which have been made in the region of the stars.

When we lift our eyes towards the sky, we perceive an apparent hollow hemisphere, placed at an indefinite distance, and surrounding the earth on every hand. In the day time, the principal object which appears in the hemisphere, is the sun. In the morning, we see him rise above the distant mountains, or from the extremity of the ocean; he gradually ascends the vault of heaven, and then declines, and disappears in the opposite quarter of the sky. In the northern parts of the globe, where we reside, if about the 21st of March, we place ourselves on an open plain, with our face towards the south, the sun will appear to rise on our left, or due east, about six in the morning, and about the same hour in the evening, he will set due west. In the month of June he rises to our left, but somewhat behind us, in a direction towards the north-east, ascends to a greater height at noon than in the month of March, and, after describing a large arc of the heavens, sets on our right, and still behind us, in the north-western quarter of the sky. In the month of December, if we stand in the same position, we may observe, without turning ourselves, both his rising and setting. He rises in the south-east, ascends to a small elevation at noon, and sets in the south-west, after having described a very small arc of the heavens. Every day he appears to move a little towards the east, or contrary to his apparent diurnal motion; for the stars which are seen to the eastward of him, appear every succeeding day to make a nearer approach to the place in which he is seen. All the variety of these successive changes is accomplished within the period of 365 days 6 hours, in which time he appears to have made a complete revolution round the heavens from west to east.

The moon is the next object in the heavens which naturally attracts our attention; and she is found to go through similar variations in the course of a month. When she first becomes visible at new moon, she appears in the western part of the heavens, in the form of a crescent, not far from the setting sun. Every night she increases in size, and removes to a greater distance from the sun, till at last, she appears in the eastern part of the horizon, just as the sun disappears in the western; at which time she presents a round full-enlightened face. After this, she gradually moves farther and farther eastward, and her enlightened part gradually decreases, till at last she seems to approach the sun as nearly in the east as she did in the west, and rises only a little before him in the morning, in the form of a crescent. All these different changes may be traced by attending to her apparent positions, from time to time, with respect to the fixed stars.

A dark shadow is occasionally seen to move across the face of the moon, which obscures her light, and gives her the appearance of tarnished copper. Sometimes this shadow covers only a small portion of her surface; at other

times it covers the whole of her disk for an hour or two, and its margin always appears of the figure of a segment of a circle. This phenomenon, which happens, at an average, about twice every year, is termed an *eclipse* of the moon. It is produced by the shadow of the earth falling upon the moon, when the sun, the earth, and the moon, are nearly in a straight line; and can happen only at the time of *full moon*. Sometimes the moon appears to pass across the body of the sun, when her dark side is turned towards the earth, covering his disk either in whole or in part, and intercepting his rays from a certain portion of the earth. This is called an *eclipse of the sun*, and can happen only at the time of *new moon*. In a total eclipse of the sun, which seldom happens, the darkness is so striking, that the planets, and some of the larger stars, are distinctly seen, and the inferior animals appear struck with terror.

Again, if, on a winter's evening, about six o'clock, we direct our view to the eastern quarter of the sky, we shall perceive certain stars just risen above the horizon; if we view the same stars about midnight, we shall find them at a considerable elevation in the south, having apparently moved over a space equal to one half of the whole hemisphere. On the next morning, about six o'clock, the same stars will be seen setting in the western part of the sky. If we turn our eyes towards the north, we shall perceive a similar motion in these twinkling orbs, but with this difference, that a very considerable number of them neither rise nor set, but seem to move round an immoveable point, called the north pole. Near this point is placed the polar star, which seems to have little or no apparent motion, and which, in our latitude, appears elevated a little more than half way between the northern part of our horizon and the zenith or point above our heads. A person who has directed his attention to the heavens for the first time, after having made such observations, will naturally inquire—Whence come those stars which begin to appear in the east? Whither have those gone, which have disappeared in the west? and, what becomes, during the day, of the stars which are seen in the night?—It will soon occur to a rational observer, who is convinced of the roundness of the earth, that the stars which rise above the eastern horizon come from another hemisphere, which we are apt to imagine below us, and when they set, return to that hemisphere again; and, that the reason why the stars are not seen in the day-time, is, not because they are absent from our hemisphere, or have ceased to shine, but because their light is obscured by the more vivid splendour of the sun.\* From such

\* This is put beyond all doubt, by the invention of the telescope; by which instrument, adapted to an equatorial motion, we are enabled to see many of the stars even at noon-day. The Author of this

observations we are led to conclude, that the globe on which we tread is suspended in empty space—is surrounded on all sides by the celestial vault—and that the whole sphere of the heavens has an *apparent* motion round the earth every twenty-four hours. Whether this motion be real, or only apparent, must be determined by other considerations.

Such general views of the nocturnal heavens, which every common observer may take, have a tendency to expand the mind, and to elevate it to the contemplation of an invisible power, by which such mighty movements are conducted. Whether we consider the vast concave, with all its radiant orbs, moving in majestic grandeur around our globe, or the earth itself whirling round its inhabitants in an opposite direction—an idea of sublimity, and of Almighty energy, irresistibly forces itself upon the mind, which throws completely into the shade the mightiest efforts of human power. The most powerful mechanical engines that were ever constructed

work, about eleven years ago, made a number of observations, by means of an *equatorial telescope*, to determine the following particulars:—What stars and planets may be conveniently seen in the day-time, when the sun is above the horizon? What degrees of magnifying power are requisite for distinguishing them? How near their conjunction with the sun they may be seen;—and, whether the diminution of the aperture of the telescope, or the increase of magnifying power, conduces most to render a star or planet visible in day-light. The results of several hundreds of observations on these points, accompanied with some original deductions and remarks, are inserted in "Nicholson's Philosophical Journal," for October, 1813, vol. 38, p. 109—128. The following are some of the results which were deduced from the observations:—That a star of the *first* magnitude may be distinguished at any time of the day, with a magnifying power of 30 times, but that a higher magnifying power is preferable—That most of the stars of the second magnitude may be seen with a power of 100; and with a power of 60 times, when the sun is not much more than two hours above the horizon—That the planet Jupiter, when not within 30 or 40 degrees of the sun, may be seen with a power of 15 times;—and that Venus may, in most instances, be seen with a power of from 7 to 100 times, and upwards—That Jupiter can scarcely be distinguished in the day-time, when within 28 degrees of the sun; but that Venus may be distinctly perceived near her superior conjunction, when only one degree and 27 minutes from the sun's margin; and, consequently, may be visible at the time of that conjunction, when her geocentric latitude equals or exceeds 1 degree 48 minutes—That she may be perceived, like a fine, slender crescent, within 35 hours after passing her *inferior* conjunction, &c. &c. One practical purpose to which such observations on Venus, at the time of her *superior* conjunction, may be applied, is, to determine the difference (if any) between her polar and equatorial diameters. For, it is only at that conjunction that she presents to the earth a full enlightened hemisphere; and in no other position can the measure of both diameters be taken, except when she makes a *transit* across the sun's disk. As the Earth, Mars, Jupiter, and Saturn, are found to be spheroids, it is highly probable that Venus is of a similar figure; but this point has never yet been ascertained by actual observation. See also "The Edinburgh Philos. Journal," No. 5, for July 1820, p. 191; and No. 13, for July, 1823—"The Scots Mag." for Feb. 1814, p. 84.—"Monthly Mag." Feb. 1814, and August 1820, p. 63.

by the agency of man, can scarcely afford us the least assistance in forming a conception of that incomprehensible power, which, with unceasing energy, communicates motion to revolving worlds. And yet such is the apathy with which the heavens are viewed by the greater part of mankind, that there are thousands who have occasionally gazed at the stars, for the space of fifty years, who are still ignorant of the fact, that they perform an *apparent* diurnal revolution round our globe.

Again, if we contemplate the heavens with some attention, for a number of successive nights, we shall find, that by far the greater part of the stars never vary their positions with respect to each other. If we observe two stars at a certain apparent distance from each other, either north or south, or in any other direction, they will appear at the same distance, and in the same relative position to each other, the next evening, the next month, and the next year. The stars, for instance, which form the *sword* and *belt* of *Orion*, present to our eye the same figure and relative aspect, during the whole period they are visible in winter, and from one year to another: and the same is the case with all the fixed stars in the firmament. On examining the sky a little more minutely however, we perceive certain bodies which regularly shift their positions. Sometimes they appear to move towards the east, sometimes towards the west, and at other times seem to remain in a stationary position. These bodies have obtained the name of *planets*, or wandering stars; and, in our latitude, are most frequently seen, either in the eastern and western, or in the southern parts of the heavens. Ten of these planetary orbs have been discovered; six of which are, for the most part, invisible to the naked eye. By a careful examination of the motions of these bodies, and their different aspects, astronomers have determined, that they all move round the sun as the centre of their motions, and form, along with the earth and several smaller globes, one grand and harmonious system. This assemblage of planetary bodies is generally termed the solar system, of which I shall now endeavour to exhibit a brief outline.

#### THE SOLAR SYSTEM.

Of this system, the sun is the centre and the animating principle, and by far the largest body that exists within its limits. The first thing that strikes the mind when contemplating this glorious orb, is its astonishing magnitude. This vast globe is found to be about 880,000 miles in diameter, and, consequently, contains a mass of matter equal to *thirteen hundred thousand globes* of the size of the earth. Were its central parts placed adjacent to the surface of the earth, its circumference would reach two hundred thousand miles beyond the moon's orbit on every

side, filling a cubical space of 681,472,000,000,000,000 miles. If it would require 18,000 years to traverse every square mile on the earth's surface, at the rate of thirty miles a day, (see p. 9,) it would require more than *two thousand millions of years* to pass over every part of the sun's surface, at the same rate. Even at the rate of 90 miles a day it would require more than 80 years to go round its circumference. Of a body so vast in its dimensions, the human mind, with all its efforts, can form no adequate conception. It appears an extensive universe in itself; and, although no other body existed within the range of infinite space, this globe alone would afford a powerful demonstration of the omnipotence of the Creator. Were the sun a hollow sphere, surrounded by an external shell, and a luminous atmosphere; were this shell perforated with several hundreds of openings into the internal part; were a globe as large as the earth placed at its centre, and another globe as large as the moon, and at the same distance from the centre as the moon is from us, to revolve round the central globe,—it would present to the view a universe as splendid and glorious as that which now appears to the vulgar eye,—a universe as large and extensive as the whole creation was conceived to be, by our ancestors, in the infancy of astronomy. And who can tell, but that Almighty Being, who has not left a drop of water in a stagnant pool without its inhabitants, has arranged a number of worlds within the capacious circuit of the sun, and peopled them with intelligent beings in the first stages of their existence, to remain there for a certain period, till they be prepared for being transported to a more expansive sphere of existence? It is easy to conceive, that enjoyments as exquisite, and a range of thoughts as ample as have ever yet been experienced by the majority of the inhabitants of our world, might be afforded to myriads of beings thus placed at the centre of this magnificent luminary. This supposition is, at least, as probable as that of the celebrated Dr. Herschel, who supposed that the *exterior* surface of the sun was peopled with inhabitants. For, if this were the case, the range of view of these inhabitants would be confined within the limits of two or three hundred miles, and no celestial body, but an immense blaze of light, would be visible in their hemisphere. Such is the variety which appears among the works of God, and such is the diversity of situations in which sensitive beings are placed, that we dare not pronounce it impossible that both these suppositions may be realized.

Though the sun seems to perform a daily circuit around our globe, he may be said, in this respect, to be fixed and immoveable. This motion is not *real*, but only *apparent*, and is owing to the globe on which we are placed moving round its axis from west to east; just as the objects on

the bank of the river seem to move in a contrary direction, when we are sailing along its stream in a steamboat. The only motion which is found to exist in the sun is, a motion of *rotation*, like that of a globe or ball twirled round a pivot or axis, which is performed in the space of 25 days and 10 hours. This motion has been ascertained by means of a variety of dark spots which are discovered by the telescope on the sun's disk; which first appear on his eastern limb, and, after a period of about thirteen days, disappear on his western, and, after a similar period, reappear on his eastern edge. These spots are various, both in number, in magnitude, and in shape: sometimes 40 or 50, and sometimes only one or two are visible, and at other times the sun appears entirely without spots.—Most of them have a very dark nucleus, or central part, surrounded by an umbra, or fainter shade. Some of the spots are as large as would cover the whole continent of Europe, Asia, and Africa, others have been observed of the size of the whole surface of the earth; and one was seen, in the year 1779, which was computed to be more than *fifty thousand miles* in diameter.

With regard to the nature of this globe—it appears highly probable, from the observations of Dr. Herschel, that the sun is a solid and opaque body, surrounded with luminous clouds which float in the solar atmosphere, and that the dark nucleus of the spots is the opaque body of the sun appearing through occasional openings in this atmosphere. The height of the atmosphere, he computes to be not less than 1843, nor more than 2765 miles, consisting of two regions; that nearest the sun being opaque, and probably resembling the clouds of our earth; the outermost emitting vast quantities of light, and forming the apparent luminous globe we behold.

The sun is the grand source of light and heat, both to the earth and to all the other planetary bodies. The heat he diffuses animates every part of our sublunary system, and all that variety of colouring which adorns the terrestrial landscape is produced by his rays. It has been lately discovered, that the rays of light, and the rays of heat, or *caloric*, are distinct from each other; for, it can be demonstrated, that some rays from the sun produce heat, which have no power of communicating light or colour. The greatest heat is found in the *red* rays, the least in the *violet* rays; and in a space beyond the red rays, where there is no light, the temperature is greatest. The rays of the sun have also been found to produce different chymical effects. The white muriate of silver is blackened in the violet ray, in the space of 15 seconds, though the red will not produce the same effect in less than 20 minutes. Phosphorus is kindled in the vicinity of the red ray, and extinguished in the vicinity of the violet. The solar light, therefore, consists of *three* different orders of rays, one

observations we are led to conclude, that the globe on which we tread is suspended in empty space—is surrounded on all sides by the celestial vault—and that the whole sphere of the heavens has an *apparent* motion round the earth every twenty-four hours. Whether this motion be real, or only apparent, must be determined by other considerations.

Such general views of the nocturnal heavens, which every common observer may take, have a tendency to expand the mind, and to elevate it to the contemplation of an invisible power, by which such mighty movements are conducted. Whether we consider the vast concave, with all its radiant orbs, moving in majestic grandeur around our globe, or the earth itself whirling round its inhabitants in an opposite direction—an idea of sublimity, and of Almighty energy, irresistibly forces itself upon the mind, which throws completely into the shade the mightiest efforts of human power. The most powerful mechanical engines that were ever constructed

work, about eleven years ago, made a number of observations, by means of an *equatorial telescope*, to determine the following particulars—What stars and planets may be conveniently seen in the day-time, when the sun is above the horizon? What degrees of magnifying power are requisite for distinguishing them? How near their conjunction with the sun they may be seen;—and, whether the diminution of the aperture of the telescope, or the increase of magnifying power, conduces most to render a star or planet visible in day-light. The results of several hundreds of observations on these points, accompanied with some original deductions and remarks, are inserted in "Nicholson's Philosophical Journal," for October, 1813, vol. 38, p. 109—128. The following are some of the results which were deduced from the observations—That a star of the *first* magnitude may be distinguished at any time of the day, with a magnifying power of 30 times, but that a higher magnifying power is preferable—That most of the stars of the second magnitude may be seen with a power of 100; and with a power of 60 times, when the sun is not much more than two hours above the horizon—That the planet Jupiter, when not within 30 or 40 degrees of the sun, may be seen with a power of 15 times;—and that Venus may, in most instances, be seen with a power of from 7 to 100 times, and upwards—That Jupiter can scarcely be distinguished in the day-time, when within 33 degrees of the sun; but that Venus may be distinctly perceived near her superior conjunction, when only one degree and 27 minutes from the sun's margin; and, consequently, may be visible at the time of that conjunction, when her geocentric latitude equals or exceeds 1 degree 43 minutes—That she may be perceived, like a fine, slender crescent, within 35 hours after passing her *inferior* conjunction, &c. &c. One practical purpose to which such observations on Venus, at the time of her *superior* conjunction, may be applied, is, to determine the difference (if any) between her polar and equatorial diameters. For, it is only at that conjunction that she presents to the earth a full enlightened hemisphere; and in no other position can the measure of both diameters be taken, except when she makes a *transit* across the sun's disk. As the Earth, Mars, Jupiter, and Saturn, are found to be spheroids, it is highly probable that Venus is of a similar figure; but this point has never yet been ascertained by actual observation. See also "The Edinburgh Philos. Journal," No. 5, for July 1820, p. 191; and No. 13, for July, 1822—"The Scots Mag." for Feb. 1814, p. 84.—"Monthly Mag." Feb. 1814, and August 1820, p. 62.

by the agency of man, can scarcely afford us the least assistance in forming a conception of that incomprehensible power, which, with unceasing energy, communicates motion to revolving worlds. And yet such is the apathy with which the heavens are viewed by the greater part of mankind, that there are thousands who have occasionally gazed at the stars, for the space of fifty years, who are still ignorant of the fact, that they perform an *apparent* diurnal revolution round our globe.

Again, if we contemplate the heavens with some attention, for a number of successive nights, we shall find, that by far the greater part of the stars never vary their positions with respect to each other. If we observe two stars at a certain apparent distance from each other, either north or south, or in any other direction, they will appear at the same distance, and in the same relative position to each other, the next evening, the next month, and the next year. The stars, for instance, which form the *sword* and *belt* of *Orion*, present to our eye the same figure and relative aspect, during the whole period they are visible in winter, and from one year to another: and the same is the case with all the fixed stars in the firmament. On examining the sky a little more minutely however, we perceive certain bodies which regularly shift their positions. Sometimes they appear to move towards the east, sometimes towards the west, and at other times seem to remain in a stationary position. These bodies have obtained the name of *planets*, or wandering stars; and, in our latitude, are most frequently seen, either in the eastern and western, or in the southern parts of the heavens. Ten of these planetary orbs have been discovered; six of which are, for the most part, invisible to the naked eye. By a careful examination of the motions of these bodies, and their different aspects, astronomers have determined, that they all move round the sun as the centre of their motions, and form, along with the earth and several smaller globes, one grand and harmonious system. This assemblage of planetary bodies is generally termed the solar system, of which I shall now endeavour to exhibit a brief outline.

#### THE SOLAR SYSTEM.

Of this system, the sun is the centre and the animating principle, and by far the largest body that exists within its limits. The first thing that strikes the mind when contemplating this glorious orb, is its astonishing magnitude. This vast globe is found to be about 880,000 miles in diameter, and, consequently, contains a mass of matter equal to *thirteen hundred thousand globes* of the size of the earth. Were its central parts placed adjacent to the surface of the earth, its circumference would reach two hundred thousand miles beyond the moon's orbit on every

side, filling a cubical space of 681,472,000,000,000,000 miles. If it would require 18,000 years to traverse every square mile on the earth's surface, at the rate of thirty miles a day, (see p. 9,) it would require more than *two thousand millions of years* to pass over every part of the sun's surface, at the same rate. Even at the rate of 90 miles a day it would require more than 90 years to go round its circumference. Of a body so vast in its dimensions, the human mind, with all its efforts, can form no adequate conception. It appears an extensive universe in itself; and, although no other body existed within the range of infinite space, this globe alone would afford a powerful demonstration of the omnipotence of the Creator. Were the sun a hollow sphere, surrounded by an external shell, and a luminous atmosphere; were this shell perforated with several hundreds of openings into the internal part; were a globe as large as the earth placed at its centre, and another globe as large as the moon, and at the same distance from the centre as the moon is from us, to revolve round the central globe,—it would present to the view a universe as splendid and glorious as that which now appears to the vulgar eye,—a universe as large and extensive as the whole creation was conceived to be, by our ancestors, in the infancy of astronomy. And who can tell, but that Almighty Being, who has not left a drop of water in a stagnant pool without its inhabitants, has arranged a number of worlds within the capacious circuit of the sun, and peopled them with intelligent beings in the first stages of their existence, to remain there for a certain period, till they be prepared for being transported to a more expansive sphere of existence? It is easy to conceive, that enjoyments as exquisite, and a range of thoughts as ample as have ever yet been experienced by the majority of the inhabitants of our world, might be afforded to myriads of beings thus placed at the centre of this magnificent luminary. This supposition is, at least, as probable as that of the celebrated Dr. Herschel, who supposed that the *exterior* surface of the sun was peopled with inhabitants. For, if this were the case, the range of view of these inhabitants would be confined within the limits of two or three hundred miles, and no celestial body, but an immense blaze of light, would be visible in their hemisphere. Such is the variety which appears among the works of God, and such is the diversity of situations in which sensitive beings are placed, that we dare not pronounce it impossible that both these suppositions may be realized.

Though the sun seems to perform a daily circuit around our globe, he may be said, in this respect, to be fixed and immoveable. This motion is not *real*, but only *apparent*, and is owing to the globe on which we are placed moving round its axis from west to east; just as the objects on

the bank of the river seem to move in a contrary direction, when we are sailing along its stream in a steamboat. The only motion which is found to exist in the sun is, a motion of *rotation*, like that of a globe or ball twirled round a pivot or axis, which is performed in the space of 25 days and 10 hours. This motion has been ascertained by means of a variety of dark spots which are discovered by the telescope on the sun's disk; which first appear on his eastern limb, and, after a period of about thirteen days, disappear on his western, and, after a similar period, reappear on his eastern edge. These spots are various, both in number, in magnitude, and in shape: sometimes 40 or 50, and sometimes only one or two are visible, and at other times the sun appears entirely without spots.—Most of them have a very dark nucleus, or central part, surrounded by an umbra, or fainter shade. Some of the spots are as large as would cover the whole continent of Europe, Asia, and Africa, others have been observed of the size of the whole surface of the earth; and one was seen, in the year 1779, which was computed to be more than *fifty thousand miles* in diameter.

With regard to the nature of this globe—it appears highly probable, from the observations of Dr. Herschel, that the sun is a solid and opaque body, surrounded with luminous clouds which float in the solar atmosphere, and that the dark nucleus of the spots is the opaque body of the sun appearing through occasional openings in this atmosphere. The height of the atmosphere, he computes to be not less than 1843, nor more than 2765 miles, consisting of two regions; that nearest the sun being opaque, and probably resembling the clouds of our earth; the outermost emitting vast quantities of light, and forming the apparent luminous globe we behold.

The sun is the grand source of light and heat, both to the earth and to all the other planetary bodies. The heat he diffuses animates every part of our sublunary system, and all that variety of colouring which adorns the terrestrial landscape is produced by his rays. It has been lately discovered, that the rays of light, and the rays of heat, or *caloric*, are distinct from each other; for, it can be demonstrated, that some rays from the sun produce heat, which have no power of communicating light or colour. The greatest heat is found in the *red* rays, the least in the *violet* rays; and in a space beyond the red rays, where there is no light, the temperature is greatest. The rays of the sun have also been found to produce different chymical effects. The white muriate of silver is blackened in the violet ray, in the space of 15 seconds, though the red will not produce the same effect in less than 20 minutes. Phosphorus is kindled in the vicinity of the red ray, and extinguished in the vicinity of the violet. The solar light, therefore, consists of *three* different orders of rays, one

producing colour, a second producing heat, and a third *chymical* effects. Euler has computed that the light of the sun is equal to 6500 candles at a foot distance, while the moon would be as one candle at  $7\frac{1}{2}$  feet; Venus at 421 feet; and Jupiter at 1320 feet.—That this immense luminary appears so small to our eyes, is owing to its vast distance, which is no less than ninety-five millions of miles. Some faint idea of this distance may be obtained, by considering, that a steam-boat, moving at the rate of 200 miles a day, would require *thirteen hundred years* before it could traverse the space which intervenes between us and the sun.

"Hail sacred source of inexhausted light!  
Prodigious instance of creating might!  
His distance man's imagination soils;  
Numbers will scarce avail to count the miles.  
As swift as thought he darts his radiance round  
To distant worlds, his system's utmost bound."  
Brown.

*The Planet Mercury.*—Mercury is the nearest planet to the sun that has yet been discovered. He is about 37 millions of miles distant from the sun, and revolves around him in 88 days. His diameter is about 3200 miles. Before the discovery of the four new planets, Ceres, Pallas, Juno, and Vesta, in the beginning of the present century, this globe was considered as the smallest primary planet in the system. His surface, however, contains above 32 millions of square miles, which is not much less than all the habitable parts of our globe. On account of his nearness to the sun, he is seldom seen by the naked eye; being always near that quarter of the heavens where the sun appears; and therefore, few discoveries have been made on his surface, by the telescope. M. Schroeter concludes, from certain observations, that this planet revolves round its axis in 24 hours and five minutes. The sun will appear to an inhabitant of Mercury seven times larger than to an inhabitant of the earth; and, if the degree of heat be in proportion to a planet's nearness to the sun, the heat in this planet will be seven times greater than on the surface of our globe; and, consequently, were the earth placed in the same position, all the water on its surface would boil, and soon be turned into vapour. But the All-wise Creator has, doubtless, attempered the surface of this globe, and the constitution of the beings that may occupy it, to the situation in which they are placed.\*

\* From a variety of facts which have been observed in relation to the production of *caloric*, it does not appear probable, that the degree of heat on the surfaces of the different planets is inversely proportional to the squares of their respective distances from the sun. It is more probable, that it depends chiefly on the distribution of the *substance of caloric* on the surfaces and throughout the atmospheres of these bodies—in different quantities, according to the different situations they occupy in the solar system;

Venus, the next planet in order from the sun, revolves around him in 224 days, at the distance of 68 millions of miles, and its diameter is about seven thousand seven hundred miles, or nearly the size of the earth; and it turns round its axis in the space of 23 hours and 20 minutes. This planet is the most brilliant orb which appears in our nocturnal heavens, and is usually distinguished by the name of the morning and evening star. When it approaches nearest to the earth, it is about 27 millions of miles distant; and at its greatest distance, it is no less than 163 millions of miles from the earth. Were the whole of its enlightened surface turned towards the earth, when it is nearest, it would exhibit a light and brilliancy twenty-five times greater than it generally does, and appear like a small brilliant moon; but at that time, its dark hemisphere is turned towards our globe. Both Venus and Mercury, when viewed by a telescope, appear to pass successively through all the shapes and appearances of the moon; sometimes assuming a gibbous phase, and at other times the form of a half moon, or that of a crescent; which proves that they are dark bodies in themselves, and derive their light from the sun. The most distinct and beautiful views of Venus, especially when she appears as a crescent, are to be obtained *in the day time*, by means of an equatorial telescope.—From a variety of observations which the author has made with this instrument, it has been found that Venus may be seen every clear day without interruption, during a period of 583 days, with the occasional exception of 13 days in one case, and only 3 days in another—a circumstance which cannot be affirmed of any other celestial body, the sun only excepted.† M. Schroeter:

and that these different quantities of caloric are put into action by the influence of the solar rays, so as to produce that degree of *sensible* heat requisite for each respective planetary globe. On this hypothesis—which is corroborated by a very great variety of facts and experiments—there may be no more sensible heat felt on the surface of the planet Mercury, than on the surface of Herschel, although one of these bodies is nearly 50 times nearer the sun than the other. We have only to suppose that a small quantity of caloric exists in Mercury, and a larger quantity in Herschel, proportionate to his distance from the centre of the system. On this ground, we have no reason to believe, either that the planets nearest the sun are parched with excessive heat, or that those that are most distant are exposed to all the rigours of insufferable cold, or that the different degrees of temperature which may be found in these bodies render them unfit for being the abodes of sensitive and intellectual beings.

† See Edin. Phil. Journ. No. V. July, 1820, and No. XIII. July 1822.—I have found from observation, that this planet may be seen in the day-time, when only  $1^{\circ} 43'$  from the sun's centre; and consequently when its geocentric latitude at the time of the superior conjunction exceeds that quantity, it may be distinctly seen during the whole period of 583 days, excepting about 85 hours before and after its *inferior* conjunction. It is well known to astronomers, that there has been a difference of opinion with respect to the period of the rotation of this planet. Casini, from observations on a bright spot which advanced

affirms, that he has discovered mountains on the surface of this globe, one of which is 10, another 11, and a third 22 miles high. It appears also to be encompassed with an atmosphere, the densest part of which is about 16,000 feet high. About twice in the course of a century, this planet appears to pass, like a dark spot, across the sun's disk. This is termed the *transit* of Venus. The last transit happened June 3, 1769; the next will happen on December 8, 1874, which will be invisible in Europe. Another will happen on the 6th of December, 1882, which will be partly visible in Great Britain.

The *Earth* is the next planet in the system. It moves round the sun in 365 days, 5 hours, and 48 minutes, at the distance of 95 millions of miles, and round its axis in 23 hours, 56 minutes, 4 seconds. The former is called its *annual*, and the latter, its *diurnal* motion. That the earth is, in reality, a moving body, is a fact which can no longer be called in question; it is indeed susceptible of the clearest demonstration. But my limits will not permit to enter into a detail of the arguments by which it is supported. I have already adverted to one consideration, from which its diurnal rotation may be inferred. (See p. 23.) Either the earth moves round its axis every day, or the whole universe moves round it in the same time. To suppose the latter case to be the fact, would involve a reflection on the wisdom of its almighty Author, and would form the only exception that we know to that beautiful proportion, harmony, and simplicity, which appear in all the works of nature. Were it possible to construct a machine as large as the city of London, and to apply to it mechanical powers sufficient to make it revolve on an axis, so as to carry round a furnace for the purpose of roasting a joint of mutton, suspended in the centre of its motion—while we might admire the ingenuity and the energies displayed in its construction—all mankind would unite in condemning it as a display of consummate folly. But such an extravagant piece of machinery would not be half so

20 degrees, in 24 hours, 24 minutes, determined the time of its rotation to be 23 hours and 20 minutes. On the other hand, Bianchini, from similar observations, concluded, that its diurnal period was 24 days and 8 hours. The difficulty of deciding between these two opinions, arises from the short time in which observations can be made on this planet, either before sun-rise or after sun-set, which prevents us from tracing, with accuracy, the progressive motion of its spots for a sufficient length of time. And although an observer should mark the position of the spots, at the same hour, on two succeeding evenings, and find they had moved forward about 20 degrees in 24 hours, he would still be at a loss to determine, whether they had moved 20 degrees *in all*, since the preceding observation, or had finished a revolution, and 20 degrees more.—In "Nicholson's Philosophical Journal," vol. 26, I endeavoured to show how this point may be determined by observations on Venus in the day-time, by which, in certain cases, the progressive motion of her spots might be traced, without interruption, for 12 hours or more, which would completely settle the period of rotation.

preposterous as to suppose, that the vast universe is daily revolving around our little globe, and that all the planetary motions have an immediate respect to it. And shall we dare to ascribe to him who is "the only wise God," contrivances which we would pronounce to be the perfection of folly in mankind? It is recorded of the astronomer Alphonsus, king of Castile, who lived in the 13th century, that, after having studied the Ptolemaic system, which supposes the earth at rest in the centre of the universe, he uttered the following impious sentence: "If I had been of God's privy council, when he made the world, I would have advised him better." So that false conceptions of the system of nature, lead to erroneous notions of that adorable Being who is possessed of infinite perfection. We find that bodies much larger than the earth have a similar rotation. The planet Jupiter, a globe 295,000 miles in circumference, moves round his axis in less than ten hours; and all the other planetary bodies, on which spots have been discovered, are found to have a diurnal motion. Besides, it is found to be a universal law of nature that smaller globes revolve round larger; but there is no example in the universe, of a larger body revolving around a smaller. The moon revolves around the earth, but she is much smaller than the earth; the moons which move around Jupiter, Saturn, and Herschel, are all less than their primaries, and the planets which perform their revolutions around the sun are much less than that central luminary.

With regard to the *annual* revolution of the earth, if such a motion did exist, the planetary system would present a scene of inextricable confusion. The planets would sometimes move backwards, sometimes forwards, and at other times remain stationary; and would describe looped curves, so anomalous and confused, that no man in his senses could view the all-wise Creator as the author of so much confusion. But, by considering the earth as revolving in an orbit between Venus and Mars, (which all celestial observations completely demonstrate,) all the apparent irregularities of the planetary motions are completely solved and accounted for; and the solar system presents a scene of beauty, harmony and grandeur, combined with a simplicity of design which characterizes all the works of Omnipotence.

*The Moon.*—Next to the sun, the moon is to us the most interesting of all the celestial orbs. She is the constant attendant of the earth, and revolves around it in 27 days, 8 hours; but the period from one new or full moon to another is about 29 days, 12 hours. She is the nearest of all the heavenly bodies; being only about two hundred and forty thousand miles distant from the earth. She is much smaller than the earth; being only 2,180 miles in diameter. Her surface, when viewed with a telescope, presents an inte

resting and a variegated aspect; being diversified with mountains, valleys, rocks, and plains, in every variety of form and position. Some of these mountains form long and elevated ridges, resembling the chains of the Alps and the Andes; while others, of a conical form, rise to a great height, from the middle of level plains, somewhat resembling the Peak of Teneriffe. But the most singular feature of the moon, is, those circular ridges and cavities which diversify every portion of her surface. A range of mountains of a circular form, rising three or four miles above the level of the adjacent districts, surrounds, like a mighty rampart, an extensive plain; and, in the middle of this plain or cavity, an insulated conical hill rises to a considerable elevation. Several hundreds of these circular plains, most of which are considerably below the level of the surrounding country, may be perceived, with a good telescope, on every region of the lunar surface. They are of all dimensions, from two or three miles to forty miles in diameter; and, if they be adorned with verdure, they must present to the view of a spectator, placed among them, a more variegated, romantic, and sublime scenery than is to be found on the surface of our globe. An idea of some of these scenes may be acquired by conceiving a plain of about a hundred miles in circumference, encircled with a range of mountains, of various forms, three miles in perpendicular height, and having a mountain near the centre, whose top reaches a mile and a half above the level of the plain. From the top of this central mountain, the whole plain, with all its variety of objects, would be distinctly visible; and the view would appear to be bounded on all sides by a lofty amphitheatre of mountains, in every diversity of shape, rearing their summits to the sky. From the summit of the circular ridge, the conical hill in the centre, the opposite circular range, the plain below, and some of the adjacent plains, which encompass the exterior ridge of the mountains, would form another variety of view; and a third variety would be obtained from the various aspects of the central mountain, and the surrounding scenery, as viewed from the plains below.

The lunar mountains are of all sizes, from a furlong to five miles in perpendicular elevation. Certain luminous spots, which have been occasionally seen on the dark side of the moon, seem to demonstrate that fire exists in this planet. Dr. Herschel and several other astronomers suppose, that they are volcanoes in a state of eruption. It would be a more pleasing idea, and perhaps as nearly corresponding to fact, to suppose, that these phenomena are owing to some occasional splendid illuminations, produced by the lunar inhabitants, during their long nights. Such a scene as the burning of Moscow, the conflagration of an extensive forest, or the splendid illumination of a large city with gas-lights, might present simi-

lar appearances to a spectator in the moon. The bright spots of the moon are the mountainous regions; the dark spots are the plains, or more level parts of her surface. There may probably be rivers or small lakes on this planet; but there are no seas or large collection of water. It appears highly probable, from the observations of Schroeter, that the moon is encompassed with an atmosphere; but no clouds, rain, nor snow seem to exist in it. The illuminating power of the light derived from the moon, according to the experiments made by Professor Leslie, is about the *one hundred and fifty thousandth part* of the illuminating power of the sun. According to the experiments of M. Boguer, it is only as 1 to 300,000.

The Moon always presents the same face to us; which proves, that she revolves round her axis in the same time that she revolves round the earth. As this orb derives its light from the sun, and reflects a portion of it upon the earth, so the earth performs the same office to the moon. A spectator on the lunar surface would behold the earth, like a luminous orb, suspended in the vault of heaven, presenting a surface about 18 times larger than the moon does to us, and appearing sometimes gibbous, sometimes horned, and at other times with a round full face. The light which the earth reflects upon the dark side of the moon may be distinctly perceived by a common telescope, from three to six or eight days after the change. The lunar surface contains about 15 millions of square miles, and is, therefore, capable of containing a population equal to that of our globe, allowing only about 53 inhabitants to every square mile. That this planet is inhabited by sensitive and intelligent beings, there is every reason to conclude, from a consideration of the sublime scenery with which its surface is adorned, and of the general beneficence of the Creator, who appears to have left no large portion of his material creation without animated existences; and it is highly probable, that *direct proofs* of the moon's being inhabited may hereafter be obtained, when all the varieties on her surface shall have been more minutely explored.\*

*The planet Mars.*—Next to the earth and moon, the planet Mars performs his revolution round the sun, in one year and ten months, to the distance of 145 millions of miles. His diameter is about 4,200 miles, and he is distinguished from all the other planets, by his ruddy appearance, which is owing to a *dense atmosphere* with which he is environed. With a good telescope, his surface appears diversified by a variety of spots; by the motion of which it is found, that he turns round his axis in 24 hours and 40 minutes. The inclination of his axis to the plane of his orbit being about 28° 48', the

\* See Appendix, No. III.

days and nights, and the different seasons in this planet, will bear a considerable resemblance to those we experience in our terrestrial sphere.\*

At his nearest approach to the earth, his distance from us is about 50 millions of miles; and, at his greatest distance, he is about 240 millions of miles; so that in the former case he appears nearly 25 times larger than in the latter. To a spectator in this planet, our earth will appear, alternately, as a morning and evening star, and will exhibit all the phases of the moon, just as Venus does to us, but with a less degree of apparent magnitude and splendour. A luminous zone has been observed about the poles of Mars, which is subject to successive changes. Dr. Herschel supposes that it is produced by the reflection of the sun's light from his frozen regions, and that the melting of these masses of polar ice is the cause of the variation in its magnitude and appearance. This planet moves, in its orbit, at the rate of fifty-five thousand miles an hour.

*The new planets.*—Between the orbits of Mars and Jupiter, four planetary bodies have been lately discovered, accompanied with circumstances somewhat different from those of the other bodies which compose our system. They are named *Ceres*, *Pallas*, *Juno*, and *Vesta*. The planet *Ceres* was discovered at Palermo, in Sicily, by M. Piazzi, on the first day of the present century. It is of a ruddy colour, and appears about the size of a star of the 8th magnitude, and is consequently invisible to the naked eye. It performs its revolution in 4 years and 7 months, at the distance of 260 millions of miles from the sun, and is reckoned, by some astronomers, to be about 1624 miles in diameter, or about half the diameter of Mercury. It appears to be surrounded with a large dense atmosphere.—*Pallas* was discovered the following year, namely, on the 28th of March, 1802, by Dr. Olbers of Bremen. It is supposed to be about 2000 miles in diameter, or nearly the size of the moon. It revolves about the sun in 4 years and 7 months, or nearly in the same time as *Ceres*, at the distance of 268 millions of miles; and is surrounded with a nebulosity or atmosphere, above 400 miles in height, similar to that of *Ceres*.—The planet *Juno* was discovered on the 1st September, 1804, by Mr. Harding of Bremen. Its mean distance from the sun is about 253 millions of miles; its revolution is completed in 4 years and 130 days, and its diameter is computed to be about 1425 miles. It is free from the nebulosity which surrounds *Pallas*, and is distinguished from all the other planets by the

great eccentricity of its orbit; being, at its least distance from the sun, only 189 millions of miles, and at its greatest distance 316 millions.—*Vesta* was discovered by Dr. Olbers on the 29th March, 1807. It appears like a star of the 5th or 6th magnitude, and may sometimes be distinguished by the naked eye. Its light is more intense and white than any of the other three, and it is not surrounded with any nebulosity. It is distant from the sun about 225 millions of miles, and completes its revolution in 3 years and 240 days. Its diameter has not yet been accurately ascertained; but from the intensity of its light, and other circumstances, it is concluded, that it exceeds in magnitude both *Pallas* and *Juno*.

These planetary globes present to our view a variety of anomalies and singularities, which appear incompatible with the regularity, proportion, and harmony which were formerly supposed to characterize the arrangements of the solar system.—They are bodies *much smaller* in size than the other planets—they revolve *nearly at the same distances* from the sun, and perform their revolutions in *nearly the same periods*—their orbits are *much more eccentric*, and have a *much greater degree of inclination* to the ecliptic, than those of the old planets—and, what is altogether singular, (except in case of comets,) *their orbits cross each other*; so that there is a *possibility* that two of these bodies might happen to interfere, and to strike each other, in the course of their revolutions. The orbit of *Ceres* crosses the orbit of *Pallas*. *Vesta* may sometimes be at a greater distance from the sun than either *Ceres*, *Pallas* or *Juno*, although its mean distance is less than that of either of them, by several millions of miles; so that the orbit of *Vesta* crosses the orbits of all the other three. From these and other circumstances, it has, with a high degree of probability, been concluded—that these four planets are the fragments of a large celestial body which once revolved between Mars and Jupiter, and which had been burst asunder by some immense irruptive force. This idea seems to have occurred to Dr. Olbers after he had discovered the planet *Pallas*, and he imagined that other fragments might possibly exist. He concluded, that, if they all diverged from the same point, “they ought to have two common points of reunion, or two nodes in opposite regions of the heavens, through which all the planetary fragments must sooner or later pass.” One of these nodes he found to be in the constellation *Virgo*, and the other in the *Whale*; and it is a remarkable coincidence, that it was in the latter of these regions that the planet *Juno* was discovered by Mr. Harding. In order to detect the remaining fragments (if any existed) Dr. Olbers examined, three times every year, all the small stars in *Virgo* and the *Whale*; and it was actually in the constellation *Virgo*, that he discovered the planet *Vesta*. It is not unlikely

\* The inclination of the earth's axis to the ecliptic, or, in other words, to the plane of its annual orbit, is 23 degrees and 26 minutes, which is the cause of the diversity of seasons, and of the different length of days and nights. Were the axis of the earth perpendicular to its orbit, as is the case with the planet *Jupiter*, there would be no diversity of seasons.

that other fragments of a similar description may be discovered. Dr. Brewster attributes the fall of meteoric stones\* to the smaller fragments of these bodies happening to come within the sphere of the earth's attraction. His ingenious reasonings on this subject, and in support of Dr. Olbers' hypothesis above stated, may be seen in *Edin. Ency.* vol. ii. p. 641, and in his "Supplementary chapters to Ferguson's Astronomy."

The facts to which I have now adverted seem to unfold a new scene in the history of the dispensations of the Almighty, and to warrant the conclusion, that the earth is not the only globe in the universe which is subject to physical changes and moral revolutions.

*The Planet Jupiter.*—This planet is 490 millions of miles distant from the sun, and performs its annual revolution in nearly twelve of our years, moving at the rate of twenty-nine thousand miles an hour. It is the largest planet in the solar system; being 89,000 miles in diameter, or about *fourteen hundred times* larger than the earth. Its motion round its axis is performed in nine hours and fifty-six minutes; and, therefore, the portions of its surface about the equator move at the rate of 28,000 miles an hour, which is nearly twenty-seven times swifter than the earth's diurnal rotation. The figure of Jupiter is that of an oblate spheroid, the axis, or diameter passing through the poles, being about 6000 miles shorter than that passing through the equator. The Earth, Saturn, and Mars are also spheroids; and it is highly probable that Mercury, Venus, and Herschel are of a similar figure, though the fact has not yet been ascertained by actual observation. When viewed with a telescope, several spots have been occasionally discovered on the surface of this planet, by the motion of which, its rotation was determined.

But what chiefly distinguishes the surface of Jupiter is several streaky appearances, or dusky strips, which extend across his disk, in lines parallel to his equator. These are generally

\* Meteoric stones, or, what are generally termed *aerolites*, are stones which sometimes fall from the upper regions of the atmosphere, upon the earth.—The substance of which they are composed is, for the most part, *metallic*; but the ore of which they consist is not to be found in the same constituent proportions in any terrestrial substances. Their fall is generally preceded by a luminous appearance, a hissing noise, and a loud explosion; and, when found immediately after their descent, are always hot.—Their size differs, from small fragments, of inconsiderable weight, to the most ponderous masses. Some of the largest portions of these stones have been found to weigh from 300 lbs. to several tons; and they have often descended to the earth with a force sufficient to bury them many feet under the soil.—Some have supposed that these bodies are projected from volcanoes in the moon; others, that they proceed from volcanoes on the earth; while others imagine that they are generated in the regions of the atmosphere; but the true cause is, probably, not yet ascertained. In some instances, these stones have penetrated through the roofs of houses, and proved destructive to the inhabitants.

termed his *belts*. Three of these belts, or zones nearly equi-distant from each other, are most frequently observed; but they are not regular or constant in their appearance.† Sometimes only one is to be seen, sometimes five, and sometimes seven or eight have been distinctly visible; and, in the latter case, two of them have been known to disappear during the time of observation. On the 28th May, 1780, Dr. Herschel perceived "the *whole surface of Jupiter* covered with small curved belts, or rather lines, that were not continuous across his disk." Though these belts are generally parallel to each other, yet they are not always so. Their breadth is likewise variable; one belt having been observed to grow narrow, while another in its neighbourhood has increased in breadth, as if the one had flowed into the other. The time of their continuance is also uncertain; sometimes they remain unchanged for several months, at other times, new belts have been formed in an hour or two. What these belts or variable appearances are it is difficult to determine. Some have regarded them as strata of clouds floating in the atmosphere of Jupiter; while others imagine, that they are the marks of great physical revolutions which are perpetually changing the surface of that planet. The former opinion appears the most probable. But, whatever be the nature of these belts, the sudden changes to which they are occasionally subject, seem to indicate the rapid operation of some powerful physical agency; for some of them are more than five thousand miles in breadth; and since they have been known to disappear in the space of an hour or two, and even during the time of a casual observation—agents more powerful than any with which we are acquainted must have produced so extensive an effect.

Jupiter is attended by four satellites or moons, which present a very beautiful appearance when viewed through a telescope. The first moon, or that nearest the planet, is 230,000 miles distant from its centre, and goes round it in  $42\frac{1}{2}$  hours; and will appear from its surface four times larger than our moon does to us. The second moon, being farther distant, will appear about the size of ours; the third, somewhat less; and the fourth, which is a million of miles distant from Jupiter, and takes sixteen days to go round him, will appear only about one-third the diameter of our moon. These moons suffer frequent eclipses from passing through Jupiter's shadow, in the same way as our moon is eclipsed by passing through the shadow of the earth. By

† A representation of these belts, in the positions in which they most frequently appear, is exhibited in the engraving, Fig. 2. Fig. 1. represents the double ring of Saturn, as it appears when viewed through a powerful telescope—Figures 1, 2, 3, 4, and 5, represent Saturn, Jupiter, Herschel, the Earth and Moon, in their relative sizes and proportions.

the eclipses of these moons, the motion of light was ascertained; and they are found to be of essential use in determining the longitude of places on the surface of our globe. This planet, if seen from its nearest moon, will present a surface a thousand times as large as our moon does to us, and will appear in the form of a crescent, a half-moon, a gibbous phase, and a full-moon, in regular succession, every 24 hours. Jupiter's axis being nearly perpendicular to his orbit, he has no sensible change of seasons, such as we experience on the earth. Were we placed on the surface of this planet, with the limited powers of vision we now possess, our earth and moon would entirely disappear, as if they were blotted out from the map of creation; and the inhabitants of these regions must have much better eyes than ours, if they know that there is such a globe as the earth in the universe.

*The planet Saturn.*—This planet is 900 millions of miles distant from the sun, being nearly double the distance of Jupiter. Its diameter is 79,000 miles, and, consequently, it is more than nine hundred times the bulk of the earth. It takes  $29\frac{1}{2}$  years to complete its revolution about the sun; but its diurnal motion is completed in ten hours and sixteen minutes; so that the year in this planet is nearly thirty times the length of ours, while the day is shorter, by more than one-half. The year, therefore, contains about twenty-five thousand one hundred and fifty days, or periods of its diurnal rotation, which is equal to 10,750 of our days. Saturn is of a spheroidal figure, or somewhat of the shape of an orange; his equatorial being more than six thousand miles longer than his polar diameter. His surface, like that of Jupiter, is diversified with belts and dark spots. Dr. Herschel, at certain times, perceived five belts on his surface, three of which were dark, and two bright. The dark belts had a yellowish tinge, and generally covered a larger zone of the disk of Saturn, than the belts of Jupiter occupy upon his surface. On account of the great distance of this planet from the sun, the light it receives from that luminary is only the *ninetieth part* of what we enjoy; but, by calculation, it is found, that this quantity is a thousand times greater than the light which the full moon affords to us. Besides, it is surrounded by no fewer than seven moons, which supply it with light in the absence of the sun. Five of these moons were discovered during the seventeenth century, by Huygens and Cassini; and the sixth and seventh were discovered by Dr. Herschel, in 1789, soon after his large forty feet reflecting telescope was constructed. These moons, and also those which accompany Jupiter, are estimated to be not less than the earth in magnitude, and are found, like our moon, to revolve round their axis in the same time in which they revolve about their respective primaries.

*Rings of Saturn.*—The most extraordinary

circumstance connected with this planet, is, the phenomenon of a double ring, which surrounds its body, but no where touches it, being thirty thousand miles distant from any part of the planet, and is carried along with the planet in its circuit round the sun. This is the most singular and astonishing object in the whole range of the planetary system; no other planet being found environed with so wonderful an appendage; and the planets which may belong to other systems, being placed beyond the reach of our observations, no idea can be formed of the peculiar apparatus with which any of them may be furnished. This double ring consists of two concentric rings, detached from each other; the innermost of which is nearly three times as broad as the outermost. The outside diameter of the exterior ring is 204,000 miles; and, consequently, its circumference will measure *six hundred and forty thousand miles*, or eighty times the diameter of our globe. Its breadth is 7,200 miles, or nearly the diameter of the earth. Were four hundred and fifty globes, of the size of the earth, placed close to one another, on a plane, this immense ring would enclose the whole of them, together with all the interstices, or open spaces between the different globes. The outside diameter of the innermost ring is 184,000 miles, and its breadth twenty thousand miles, or about  $2\frac{1}{2}$  times broader than the diameter of the earth. The dark space, or interval, between the two rings, is 2,800 miles. The breadth of both the rings, including the dark space between them, is thirty thousand miles, which is equal to the distance of the innermost ring from the body of Saturn.

The following figure represents a view of Saturn and his rings, as they would appear, were our eye perpendicular to one of the planes of those rings; but our eye is never so much elevated above either plane, as to have the visual ray standing at right angles to it; it is never elevated more than 90 degrees above the planes of the rings. When we view Saturn through a telescope, we always see the ring at an oblique angle, so that it appears of an oval form, the outward circular rim being projected into an ellipsis more or less oblong, according to the different degrees of obliquity with which it is viewed, as will be seen in the figure of Saturn in the copperplate engraving.

These rings cast a deep shadow upon the planet, which proves that they are not shining fluids, but composed of solid matter. They appear to be possessed of a higher reflective power than the surface of Saturn; as the light reflected by them is more brilliant than that of the planet. One obvious use of this double ring is, to reflect light upon the planet, in the absence of the sun; what other purposes it may be intended to subserve, in the system of Saturn, is, at present, to us unknown. The sun illuminates

one side of it during fifteen years, or one-half of the period of the planet's revolution; and during the next fifteen years, the other side is enlightened in its turn. Twice in the course of thirty years, there is a short period, during which neither side is enlightened, and when, of course, it ceases to be visible;—namely, at the time when the sun ceases to shine on one side, and is about to shine on the other. It revolves round its axis, and, consequently, around Saturn, in ten hours and a half, which is at the rate of a thousand miles in a minute, or fifty-eight times swifter than the earth's equator. When viewed from the middle zone of the planet, in the absence of the sun, the rings will appear like vast luminous arches, extending along the canopy of heaven, from the eastern to the western horizon; having an apparent breadth equal to a hundred times the apparent diameter of our moon, and will be seen darkened about the middle, by the shadow of Saturn.\*

There is no other planet in the solar system, whose firmament will present such a variety of splendid and magnificent objects, as that of Saturn. The various aspects of his seven moons, one rising above the horizon, while another is setting, and a third approaching to the meridian;

\* See the engraving, fig. 7, which represents a view of the appearance which the rings and moons of Saturn will exhibit, in certain cases, about midnight, when beheld from a point 20 or 30 degrees north from his equator. The shade on the upper part of the rings represents the shadow of the body of Saturn. The shadow will appear to move gradually as the west as the morning approaches.

one entering into an eclipse, and another emerging from it; one appearing as a crescent, and another with a gibbous phase; and sometimes the whole of them shining in the same hemisphere, in one bright assemblage; the majestic motions of the rings,—at one time illuminating the sky with their splendour, and eclipsing the stars; at another, casting a deep shade over certain regions of the planet, and unveiling to view the wonders of the starry firmament—are scenes worthy of the majesty of the Divine Being to unfold, and of rational creatures to contemplate. Such magnificent displays of wisdom and omnipotence lead us to conclude that the numerous splendid objects connected with this planet were not created merely to shed their lustre on naked rocks and barren sands; but that an immense population of intelligent beings is placed in those regions, to enjoy the bounty and to adore the perfections of their great Creator. The double ring of Saturn, when viewed through a good telescope, generally appears like a luminous handle on each side of the planet, with a dark interval between the interior edge of the ring and the convex body of Saturn; which is owing to its oblique position with respect to our line of vision. When its outer edge is turned directly towards the earth, it becomes invisible, or appears like a dark stripe across the disk of the planet. This phenomenon happens once every fifteen years.

*The planet Herschel.*—This planet, which is also known by the names of the *Georgium Sidus*, and *Uranus*, was discovered by Dr. Herschel on the 13th March, 1781. It is the

most distant planet from the sun, that has yet been discovered; being removed at no less than 1800 millions of miles from that luminary, which is nineteen times farther than the earth is from the sun—a distance so great, that a cannon ball, flying at the rate of 480 miles an hour, would not reach it in 400 years. Its diameter is about 35,000 miles; and, of course, it is about eighty times larger than the earth. It appears like a star of the sixth magnitude; but can seldom be distinguished by the naked eye. It takes about 83 years and a half to complete its revolution round the sun; and, though it is the slowest moving body in the system, it moves at the rate of 15,000 miles an hour. As the degree of sensible heat in any planet does not appear to depend altogether on its nearness to the sun, the temperature of this planet may be as mild as that which obtains in the most genial climate of our globe.\* The diameter of the sun, as seen from Herschel, is little more than the apparent diameter of Venus, as seen by the naked eye; and the light which it receives from that luminary, is 360 times less than what we experience; yet this proportion is found by calculation to be equal to the effect which would be produced by 248 of our full moons; and, in the absence of the sun, there are six moons which reflect light upon this distant planet, all of which were discovered likewise by Dr. Herschel. Small as the proportion of light is, which this planet receives from the sun, it is easy to conceive, that beings similar to man, placed on the surface of this globe, with a slight modification of their organs of vision, might be made to perceive objects with a clearness and distinctness even superior to what we can do. We have only to suppose, that the Creator has formed their eyes with pupils capable of a much larger expansion than ours; and has endued their retinas with a much greater degree of nervous sensibility. At all events, we may rest assured, that He who has placed sentient beings in any region, has, by laws with which we are partly unacquainted, adapted the constitution of the inhabitant to the nature of the habitation.

\* Strange and amazing must the difference be,  
Twixt this dull planet and bright Mercury;  
Yet reason says, nor can we doubt at all,  
Millions of beings dwell on either ball,  
With constitutions fitted for that spot  
Where Providence, all-wise, has fixed their lot."  
*Baker's Universe.*

The celestial globes which I have now described, are all the planets which are at present known to belong to the solar system. It is probable that other planetary bodies may yet be discovered between the orbits of Saturn and Herschel, and even far beyond the orbit of the latter; and it is also not improbable that planets may

exist in the immense interval of 57 millions of miles between Mercury and the Sun.† These (if any exist) can be detected only by a series of day observations, made with equatorial telescopes; as they could not be supposed to be seen, after sunset, on account of their proximity to the sun. Five primary‡ planets, and eight secondaries, have been discovered within the last 42 years, and, therefore, we have no reason to conclude, that all the bodies belonging to our system have yet been detected, till every region of the heavens be more fully explored.

*Comets.*—Besides the planetary globes to which I have now adverted, there is a class of celestial bodies which occasionally appear in the heavens, to which the name of comets has been given. They are distinguished from the other celestial bodies, by their ruddy appearance, and by a long train of light, called the *tail*, which sometimes extends over a considerable portion of the heavens, and which is so transparent, that the stars may be seen through it. The tail is always directed to that part of the heavens which is opposite to the sun, and increases in size as it approaches him, and is again gradually diminished, as the comet flies off to the more distant regions of space. Their apparent magnitude is very different: sometimes they appear only of the bigness of the fixed stars; at other times they equal the diameter of Venus; and sometimes they have appeared nearly as large as the moon. They traverse the heavens in all directions, and cross the orbits of the planets. When examined through a telescope, they appear to consist of a dark central nucleus, surrounded by a dense atmosphere, or mass of vapours. They have been ascertained to move in long narrow ellipses or ovals, around the sun; some of them, on their nearest approach to him, having been within a million of miles of his centre; and then fly off to a region several thousands of millions of miles distant. When near the sun, they move with amazing velocity. The velocity of the comet which appeared in 1680, according to Sir Isaac Newton's calculation, was eight hundred and eighty thousand miles an hour. They appear to be bodies of no great density, and their

† The Author, some years ago, described a method by which the planets (if any) within the orbit of Mercury, may be discovered in the day-time, by means of a simple contrivance for intercepting the solar rays, and by the frequent application, by a number of observers, of powerful telescopes, to a certain portion of the sky, in the vicinity of the sun. The details of this plan have not yet been published; but the reader will see them alluded to in No. V. of the Edinburgh Philosophical Journal, for July 1830, p. 191.

‡ A primary planet is that which revolves round the sun as a centre; as Mars, Jupiter, and Saturn. A secondary planet is one which revolves round a primary planet as its centre; as the Moon, and the satellites of Jupiter and Saturn. The primary planets are distinguished from the fixed stars by the steadiness of their light; not having a twinkling appearance, as the stars exhibit.

\* See Note, page 82.

size seldom exceeds that of the moon. The length of the tails of some comets has been estimated at fifty millions of miles. According to Dr. Herschel's computations, the solid nucleus or central part of the comet which appeared in 1811, was only 428 miles in diameter; but the real diameter of the head, or nebulous portion of the comet, he computed to be about 127 thousand miles. The length of its tail he computed to be above one hundred millions of miles, and its breadth nearly fifteen millions. It was nearest to the earth on the 11th of October, when its distance was 113 millions of miles. The number of comets which have occasionally been seen within the limits of our system, since the commencement of the Christian era, is about 500, of which the paths or orbits of 98 have been calculated.

As these bodies cross the paths of the planets in every direction, there is a possibility, that some of them might strike against the earth in their approach to the sun; and, were this to happen, the consequences would be awful beyond description. But we may rest assured that that Almighty Being who at first launched them into existence, directs all their motions, however complicated; and that the earth shall remain secure against all such concussions from celestial agents, till the purposes of his moral government in this world shall be fully accomplished. What regions these bodies visit, when they pass beyond the limits of our view; upon what errands they are sent, when they again revisit the central parts of our system; what is the difference in their physical constitution, from that of the sun and planets; and what important ends they are destined to accomplish, in the economy of the universe, are inquiries which naturally arise in the mind, but which surpass the limited powers of the human understanding at present to determine. Of this, however, we may rest assured, that they were not created in vain; that they subserve purposes worthy of the infinite Creator; and that wherever he has exerted his power, there also he manifests his wisdom and beneficence.\*

Such is a general outline of the leading facts connected with that system of which we form a part. Though the energies of divine power had never been exerted beyond the limits of this system, it would remain an eternal monument of the wisdom and omnipotence of its Author. Inde-

\* A comet has lately been discovered, whose periodical revolution is found to be only 8 years and 167 days. At its greatest distance from the sun, it is within the orbit of Jupiter, and it possesses this peculiar advantage for observation, that it will become visible ten times in thirty-three years. It was last seen in June, 1822, by the astronomers in the observatory of Paramatta, New Holland, in positions very near to those which had been previously calculated by Mr Enke. It is probable, that the observations which may hereafter be made on this comet, will lead to more definite and accurate views of the nature and destination of these singular bodies.

pendent of the sun, which is like a vast universe in itself, and of the numerous comets which are continually traversing its distant regions, it contains a mass of material existence, arranged in the most beautiful order, two thousand five hundred times larger than our globe. From late observations, there is the strongest reason to conclude, that the sun, along with all this vast assemblage of bodies, is carried through the regions of the universe, towards some distant point of space, or around some wide circumference, at the rate of more than sixty thousand miles an hour; and if so, it is highly probable, if not absolutely certain, that we shall never again occupy that portion of *absolute space*, through which we are this moment passing, during all the succeeding ages of eternity.

Such a glorious system must have been brought into existence, to subserve purposes worthy of the infinite wisdom and benevolence of the Creator. To suppose that the distant globes, of which it is composed, with their magnificent apparatus of rings and moons, were created merely for the purpose of affording a few astronomers, in these latter times, a peep at them through their glasses, would be inconsistent with every principle of reason; and would be charging Him, who is the source of wisdom, with conduct which we would pronounce to be folly in the sons of men. Since it appears, so far as our observation extends, that matter exists solely for the sake of sensitive and intelligent beings, and that the Creator made nothing in vain; it is a conclusion to which we are necessarily led, that the planetary globes are inhabited by various orders of intellectual beings, who participate in the bounty, and celebrate the glory of their Creator.

When this idea is taken into consideration, it gives a striking emphasis to such sublime declarations of the sacred volume as these:—"All nations before him are as nothing—He sitteth upon the circle of the earth, and the inhabitants thereof are as grasshoppers—The nations are as the drop of a bucket—All the inhabitants of the world are reputed as nothing in his sight; and he doth according to his will in the army of heaven, and among the inhabitants of the earth—Thou hast made heaven, and the heaven of heavens, with all their host; and thou preservest them all, and the host of heaven worshippeth thee—When I consider thy heavens, what is man, that thou art mindful of him?" If the race of Adam were the principal intelligences in the universe of God, such passages would be stripped of all their sublimity, would degenerate into mere hyperboles, and be almost without meaning. If man were the only rational being who inhabited the material world, as some arrogantly imagine, it would be no wonder at all, that God should be "mindful of him;" nor could "all the inhabitants of this world," with any propriety, be compared to

"a drop of a bucket," and be "reputed as nothing in his sight." Such declarations would be contrary to fact, if this supposition were admitted; for it assumes that man holds the *principal station* in the visible universe. The expressions—"The heavens, the heaven of heavens," and "the host of heaven worshipping God," would also, on this supposition, degenerate into something approaching to mere inanity. These expressions, if they signify any thing that is worthy of an inspired teacher to communicate, evidently imply, that the universe is vast and extensive, beyond the range of human comprehension—that it is peopled with myriads of inhabitants—that these inhabitants are possessed of intellectual natures, capable of appreciating the perfections of their Creator—and that they pay him a tribute of rational adoration. "The host of heaven worshippeth thee." So that the language of scripture is not only consistent with the doctrine of a plurality of worlds, but evidently supposes their existence to all the extent to which modern science can carry us. However vast the universe now appears—however numerous the worlds and systems of worlds, which may exist within its boundless range—the language of scripture is sufficiently comprehensive and sublime, to express all the emotions which naturally arise in the mind, when contemplating its structure—a characteristic which will apply to no other book, or pretended revelation. And this consideration shows not only the harmony which subsists between the discoveries of revelation and the discoveries of science, but also forms by itself a strong presumptive evidence, that the records of the Bible are authentic and divine.\* Vast as the solar system, we have now been contemplating, may appear, it is but a mere point in the map of creation. To a spectator placed in one of the stars of the seventh magnitude, not only the glories of this world, and the more resplendent scenes of the planet Saturn, but even the sun himself would entirely disappear, as if he were blotted out of existence. "Were the sun," says Mr. Addison, "which enlightens this part of the creation, with all the host of the planetary worlds that move about him, utterly extinguished and annihilated, they would not be missed by an eye that could take in the whole compass of nature, more than a grain of sand upon the seashore. The space they possess is so exceedingly little, in comparison of the whole, that it would scarce make a blank in creation."

*The Fixed Stars.*—When we pass from the planetary system to other regions of creation, we have to traverse, in imagination, a space so immense, that it has hitherto baffled all the efforts of science to determine its extent. In these remote and immeasurable spaces, are placed

those immense luminous bodies usually denominated the *fixed stars*. The nearest stars are, on good grounds, concluded to be at least *twenty billions* of miles distant from our globe—a distance through which *light* (the swiftest body in nature) could not travel in the space of three years; and which a ball, moving at the rate of 500 miles an hour, would not traverse in four millions five hundred thousand years, or 750 times the period which has elapsed since the Mosaic creation.—But how far they may be placed beyond this distance, no astronomer will pretend to determine. The following consideration will prove, to those unacquainted with the mathematical principles of astronomy, that the stars are placed at an immeasurable distance. When they are viewed through a telescope which magnifies objects a thousand times, they appear no larger than to the naked eye; which circumstance shows, that though we were placed at the thousandth part of the distance from them at which we now are, they would still appear only as so many shining points; for we should still be distant from the nearest of them, twenty thousand millions of miles: or, in other words, were we transported several thousands of millions of miles from the spot we now occupy, though their numbers would appear exceedingly increased, they would appear no larger than they do from our present station; and we behoved to be carried forward thousands of millions of miles further in a long succession, before their disks appeared to expand into large circles, like the moon. Dr. Herschel viewed the stars with telescopes, magnifying *six thousand times*, yet they still appeared only as brilliant points, without any sensible disks, or increase of diameter. This circumstance incontrovertibly proves the two following things:—  
1. That the stars are *luminous bodies*, which shine by their own native light; otherwise they could not be perceived at such vast distances.  
2. That they are bodies of an immense size, not inferior to the sun; and many of them, it is probable, far exceed that luminary in bulk and splendour.

The stars, on account of the difference in their apparent magnitudes, have been distributed into several classes or orders. Those which appear largest are called stars of the *first* magnitude; next to those in lustre, stars of the *second* magnitude, and so on to stars of the *sixth* magnitude, which are the smallest that can be distinguished by the naked eye. Stars of the 7th, 8th, 9th, 10th, &c. magnitudes, which cannot be seen by the naked eye, are distinguished by the name of *telescopic stars*. Not more than a thousand stars can be distinguished by the naked eye, in the clearest winter's night; but, by means of the telescope, millions have been discovered. (See p. 11.) And, as it is probable that by far the greater part lie beyond the reach of the best glasses which have been or ever will be constructed by man—

the real number of the stars may be presumed to be beyond all human calculation or conception, and perhaps beyond the grasp of an angelic comprehension.

In consequence of recent discoveries, we have now the strongest reason to believe, that all the stars in the universe are arranged into clusters, or groups, which astronomers distinguish by the name of *Nebulae* or *Starry Systems*, each nebula consisting of many thousands of stars. The nearest nebula is that whitish space or zone, which is known by the name of the *Milky Way*, to which our sun is supposed to belong. It consists of many hundreds of thousands of stars.—When Dr. Herschel examined this region, with his powerful telescopes, he found a portion of it only 15 degrees long and 2 broad, which contained *fifty thousand* stars large enough to be distinctly counted; and he suspected twice as many more, which, for want of sufficient light in his telescope, he saw only now and then. More than two thousand five hundred nebulae have already been observed; and, if each of them contain as many stars as the Milky Way, several hundreds of millions of stars must exist, even within that portion of the heavens which lies open to our observation.

It appears, from numerous observations, that various changes are occasionally taking place in the regions of the stars. Several stars have appeared for a while in the heavens, and then vanished from the sight. Some stars which were known to the ancients, cannot now be discovered; and stars are now distinctly visible, which were to them unknown. A few stars have gradually increased in brilliancy, while others have been constantly diminishing in lustre. Certain stars, to the number of 15, or upwards, are ascertained to have a periodical increase and decrease of their lustre, sometimes appearing like stars of the 1st or 2d magnitude, sometimes diminishing to the size of the 4th or 5th magnitude, and sometimes altogether disappearing to the naked eye. It also appears, that changes are taking place among the nebulae—that several nebulae are formed by the decomposition of larger nebulae, and that many nebulae of this kind are at present detaching themselves from the nebula of the milky way. These changes seem to indicate, that mighty movements and vast operations are continually going on in the distant regions of creation, under the superintendence of the Sovereign of the Universe, upon a scale of magnitude and grandeur which overwhelms the human understanding.

To explore, more extensively, the region of the starry firmament; to mark the changes that are taking place; to ascertain all the changeable stars; to determine the periodical variations of their light; the revolutions of double and triple stars; and the motions, and other phenomena peculiar to these great bodies, will furnish

employment for future enlightened generations and will, perhaps, form a part of the studies and investigations of superior intelligences, in a higher sphere of existence, during an indefinite lapse of ages.

If every one of these immense bodies be a *Sun*, equal or superior to ours, and encircled with a host of planetary worlds, as we have every reason to conclude, (see pp. 11, 31,) how vast must be the extent of creation! how numerous the worlds and beings which exist within its boundless range! and, how great, beyond all human or angelic conception, must be the power and intelligence of that glorious Being, who called this system from nothing into existence, and continually superintends all its movements! The mind is bewildered and confounded when it attempts to dwell on this subject; it feels the narrow limits of its present faculties; it longs for the powers of a seraph, to enable it to take a more expansive flight, into those regions which “eye hath not seen;” and, while destitute of these, and chained down to this obscure corner of creation, it can only exclaim, in the language of inspiration, “Who can by searching find out God?—Great is our Lord, and of great power; his understanding is infinite!—Great and marvellous are thy works, Lord God Almighty!—Who can utter the mighty acts of Jehovah—who can show forth all his praise!”

After what has been now stated in relation to the leading facts of astronomy, it would be needless to spend time in endeavouring to show its connexion with religion. It will be at once admitted, that all the huge globes of luminous and opaque matter, to which we have adverted, are the workmanship of Him “who is wonderful in counsel and excellent in working;” and form a part of the dominions of that august Sovereign, “whose kingdom ruleth over all.” And shall it ever be insinuated, that this subject has no relation to the great object of our adoration? and that it is of no importance in our views of the Divinity, whether we conceive his dominions as circumscribed within the limits of little more than 25,000 miles, or as embracing an extent which comprehends innumerable worlds? The objects around us in this sublunary sphere strikingly evince the superintendency, the wisdom, and benevolence of the Creator; but this science demonstrates, beyond all other departments of human knowledge, the *grandeur and magnificence* of his operations: and raises the mind to sublimer views of his attributes than can be acquired by the contemplation of any other objects. A serious contemplation of the sublime objects which astronomy has explored, must, therefore, have a tendency to inspire us with profound veneration of the eternal Jehovah—to humble us in the dust before his august presence—to excite admiration of his condescension and grace in the work of redemption—to show us the littleness of

this world, and the insignificance of those riches and honours to which ambitious men aspire with so much labour and anxiety of mind—to demonstrate the glory and magnificence of God's universal kingdom—to convince us of the infinite sources of varied felicity which he has in his power to communicate to holy intelligences—to enliven our hopes of the splendours of that "exceeding great and eternal weight of glory" which will burst upon the spirits of good men, when they pass from this region of mortality—and to induce us to aspire with more lively ardour after that heavenly world, where the glories of the Deity and the magnificence of his works will be more clearly unfolded.

If, then, such be the effects which the objects of astronomy have a tendency to produce on a devout and enlightened mind—to call in question the propriety of exhibiting such views in religious publications, or in the course of religious instruction, would be an approach to impiety, and an attempt to cover with a veil the most illustrious visible displays of divine glory. It forms a striking evidence of the depravity of man, as well as of his want of true taste, and of a discernment of what is excellent, that the grandeur of the nocturnal heavens, and the perfections of Deity they proclaim, are beheld with so much apathy and indifference by the bulk of mankind. Though "the heavens declare the glory of God," in the most solemn and impressive language, adapted to the comprehension of every kindred and every tribe, yet "a brutish man knoweth not, neither doth a fool understand this." They can gaze upon these resplendent orbs with as little emotion as the ox that feeds on the grass, or as the horse that drags their carcasses along in their chariots. They have even attempted to ridicule the science of the heavens, to caricature those who have devoted themselves to such studies, and to treat with an indifference, mingled with contempt, the most august productions of Omnipotence. Such persons must be considered as exposing themselves to that divine denunciation—"Because they regard not the works of Jehovah, neither consider the operations of his hands, he will destroy them and not build them up." If the structure of the heavens, and the immensity of worlds and beings they contain, were intended by the Creator to *adumbrate*, in some measure, his invisible perfections, and to produce a sublime and awful impression on all created intelligences, (see pp. 22, 26, 28,) it must imply a high degree of disrespect to the Divinity wilfully to overlook these astonishing scenes of Power and Intelligence. It is not a matter of mere taste or caprice, whether or not we direct our thoughts to such subjects, but an imperative duty to which we are frequently directed in the word of God; the *wilful neglect* of which, where there is an opportunity of attending to it, must subject us to all that is included in the threatening

now specified, if there be any meaning in language.

That the great body of professed Christians are absolute strangers to the sublime sentiments which a serious contemplation of the heavens inspires, must be owing, in part, to the minds of Christian parents and teachers not having been directed to such subject, or to the views they entertain respecting the relation of such contemplations to the objects of religion. In communicating religious instructions in reference to the attributes of God, the heavens are seldom referred to, except in such a vague and indefinite manner as can produce no deep nor vivid impression on the mind; and many pious persons, whose views have been confined to a narrow range of objects, have been disposed to declaim against such studies, as if they had a tendency to engender pride and self-conceit, and as if they were even dangerous to the interests of religion and piety. How very different were the feelings and the conduct of the sacred writers! They call upon every one of God's intelligent offspring to "stand still, and consider the wondrous works of the Most High;" and describe the profound emotions of piety which the contemplation of them produced on their own minds; "Lift up your eyes on high and behold! Who hath created these things! The heavens declare the glory of God, and the firmament sheweth his handy-work.—When I consider thy heavens, the work of thy fingers, the moon and the stars which thou hast ordained—what is man that thou art mindful of him, and the son of man that thou visitest him! Thou, even thou, art Lord alone; thou hast made heaven, and the heaven of heavens, with all their host; and thou preservest them all; and the hosts of heaven worship thee. All the gods of the nations are idols; but the Lord made the heavens: Honour and Majesty are before him. Jehovah hath prepared his throne in the heavens: and his kingdom ruleth over all. Sing praises unto God, ye kingdoms of the earth, to him that rideth on the heaven of heavens. Ascribe ye power to our God; for his strength is in the heavens. Praise him for his mighty acts, praise him *according to his excellent greatness.*" If we would enter, with spirit, into such elevated strains of piety, we must not content ourselves with a passing and vacant stare at the orbs of heaven, as if they were only so many brilliant studs fixed in the canopy of the sky; but must "*consider*" them, with fixed attention, in all the lights in which revelation and science have exhibited them to our view, if we wish to praise God for his mighty works, and "*according to his excellent greatness.*" And, for this purpose, the conclusions deduced by those who have devoted themselves to celestial investigations, ought to be presented to the view of the intelligent Christian, that he may be enabled to "speak of the glory of Jehovah's kingdom, and to talk of his power."

## THE CHRISTIAN PHILOSOPHER.

Having, in the preceding sketches, considerably exceeded the limits originally prescribed for this department of my subject, I am reluctantly compelled to despatch the remaining sciences with a few brief notices.

### NATURAL PHILOSOPHY.

The object of *Natural Philosophy* is, to observe and describe the phenomena of the material universe, with a view to discover their causes, and the laws by which the Almighty directs the movements of all bodies in heaven and on earth. It embraces an investigation of the laws of gravitation, by which the planets are directed in their motions—the laws by which water, air, light, and heat are regulated, and the effects they produce in the various states in which they operate—the nature of colours, sounds, electricity, galvanism, and magnetism, and the laws of their operation—the causes which operate in the production of thunder, lightning, luminous and fiery meteors, hail, rain, snow, dew, and other atmospherical phenomena. In short, it embraces all the objects of Natural History formerly alluded to, with a view to ascertain the causes of their varied appearances, and the principles that operate in the changes to which they are subject; or, in other words, the laws by which the diversified phenomena of universal nature are produced and regulated. One subordinate use of the knowledge derived from this science, is, to enable us to construct all those mechanical engines which facilitate human labour, and increase the comforts of mankind, and all those instruments which tend to enlarge our views of the operations of nature. A still higher and nobler use to which philosophy is subservient, is, to demonstrate the wisdom and intelligence of the Great First Cause of all things, and to enlarge our conceptions of the admirable contrivance and design which appear in the different departments of universal nature. In this view, it may be considered as forming a branch of *Natural Theology*, or, in other words, a branch of the religion of angels, and of all other holy intelligences.

This department of Natural Science has generally been divided into the following branches:

I. *Mechanics*.—This branch, considered in its most extensive range, includes an investigation of the general properties of matter; such as solidity, extension, divisibility, motion, attraction, and repulsion—the laws of gravitation, and of central forces, as they appear to operate in the motions of the celestial bodies, and on the surface of our globe, in the phenomena of falling bodies, the motions of projectiles, the vibration of pendulums, &c.—the theory of machines, the principles on which their energy depends; the properties of the mechanical powers—the lever, the wheel and axle, the pulley, the inclined plane, the wedge, and the screw—and the effects resulting from their various combinations. From the

investigations of philosophers on these subjects, we learn the laws by which the great bodies of the universe are directed in their motions; the laws which bind together the different portions of matter on the surface of the earth, and which regulate the motions of animal, vegetable, and inanimate nature; and the principles on which cranes, mills, wheel-carriages, pile-engines, threshing-machines, and other engines, are constructed; by means of which, man has been enabled to accomplish operations far beyond the limits of his own physical powers.

Without a knowledge of the laws of motion, and assistance from the combined effects of the mechanical powers, man would be a very limited being, his enjoyments would be few, and his active energies confined within a very narrow range. In a savage state, ignorant of manufactures, agriculture, architecture, navigation, and the other arts which depend upon mechanical combinations, he is exposed, without shelter, to the inclemencies of the season; he is unable to transport himself beyond seas and oceans, to visit other climes and other tribes of his fellow men; he exists in the desert, comfortless and unimproved; the fertile soil, over which he roams, is covered with thorns, and briers, and thickets, for the haunt of beasts of prey; his enjoyments are little superior to those of the lion, the hyena, and the elephant, while he is much their inferior in point of agility and physical strength. But when philosophy has once demonstrated the principles of mechanics, and introduced the practice of the useful arts, “the wilderness and the solitary place are made glad, and the desert rejoices and blossoms as the rose.” Cities are founded, and gradually rise to opulence and splendour; palaces and temples are erected; the damp cavern and the rush-built hut are exchanged for the warm and comfortable apartments of a substantial mansion; ships are built, and navigated across the ocean; the treasures of one country are conveyed to another, an intercourse is carried on between the most distant tribes of mankind; commerce flourishes, and machinery of all kinds is erected, for facilitating human labour, and promoting the enjoyments of man. And when the principles and the practice of “pure and undefiled religion” accompany these physical and mechanical operations, love and affection diffuse their benign influence; the prospect brightens as years roll on, and man advances with pleasure and improvement to the scene of his high destination.

II. *Hydrostatics* treats of the pressure and equilibrium of fluids. From the experiments which have been made in this branch of philosophy, the following important principles, among many others have been deduced:—

(1.) *That the surface of all waters which have a communication, whilst they are at rest, will be perfectly level.* This principle will be more

clearly understood by an inspection of the following figures. If water be poured into the tube A,

(Fig. 1.) it will run through the horizontal tube E, and rise in the opposite tube B, to the same

height as it stands at A. It is on this principle that water is now conveyed underground, through conduit pipes, and made to rise to the level of the fountain whence it is drawn. The city of Edinburgh, a considerable part of which is elevated above the level of the surrounding country, is supplied with water from a reservoir on the Pentland hills, several miles distant. The water is conveyed in leaden pipes down the declivity of the hill, along the interjacent plain, and up to the entrance of the castle, whence it is distributed to all parts of the city. If the point A represent the level of the reservoir, C D will represent the plain along which the water is conveyed, and B the elevation to which it rises on the castle hill. On the same principle, and in a similar manner, the city of London is supplied with water from the water-works at London bridge. Had the ancients been acquainted with this simple but important principle, it would have saved them the labour and expense of rearing those stupendous works of art, the *aqueducts*, which consisted of numerous arches of a vast size, and sometimes piled one above another.

Fig. 2. represents the *syphon*, the action of which depends upon the pressure of the atmosphere. If this instrument be filled with water, or any other liquid, and the shorter leg, G, plunged to the bottom of a cask, or other vessel, containing the same liquid, the water will run out at the longer leg, F, till the vessel be emptied, in consequence of the atmospheric pressure upon the surface of the liquid. On this principle, water may be conveyed over a rising ground to any distance, provided the perpendicular height of the syphon above the surface of the water in the fountain does not exceed 32 or 33 feet. On the same principle are constructed the fountain

at command, the *cup of Tantalus*, and other entertaining devices. The same principle, too, enables us to account for springs which are sometimes found on the tops of mountains, and for the phenomena of *intermitting* springs, or those which flow and stop by regular alternations.

(2.) *Any quantity of fluid, however small, may be made to counterpoise any quantity, however large.* This is what has generally been termed the *Hydrostatical Paradox*; and from this principle it follows, that a given quantity of water may exert a force several hundred times greater or less, according to the manner in which it is employed. This force depends on the *height* of the column of water, independent of its quantity; for its *pressure* depends on its perpendicular height. By means of water conveyed through a very small perpendicular tube, of great length, a very strong hogshead has been burst to pieces, and the water scattered about with incredible force. On this principle, the *hydrostatic press*, and other engines of immense power, have been constructed.

(3.) *Every body which is heavier than water, or which sinks in it, displaces so much of the water as is equal to the bulk of the body immersed in the water.* On this principle, the specific gravities, or comparative weight, of all bodies are determined. It appears to have been first ascertained by Archimedes, and, by means of it, he determined that the golden crown of the king of Syracuse had been adulterated by the workmen. From this principle we learn, among many other things, the specific gravity of the human body; and that four pounds of cork will preserve a person weighing 135 pounds from sinking, so that he may remain with his head completely above water.

*Hydraulics*, which has sometimes been treated as a distinct department of mechanical philosophy, may be considered as a branch of hydrostatics. It teaches us what relates to the *motion of fluids*, and how to estimate their velocity and force. On the principles of this science, all machines worked by water are constructed—as steam-engines, water-mills, common and forcing pumps, syphons, fountains, and fire-engines.

III. *Pneumatics*.—This branch of philosophy treats of the nature and properties of the atmosphere, and of their effects on solid and fluid bodies. From this science we learn, that air has *weight*, and presses on all sides, like other fluids; that the pressure of the atmosphere upon the top of a mountain is less than on a plain beneath; that it presses upon our bodies with a weight of several thousand pounds more at one time than at another; that air can be compressed into forty thousand times less space than it naturally occupies; that it is of an elastic or expansive nature, and that the force of its spring is equal to its weight; that its elasticity is increased by heat; that it is necessary to the production of sound, the support of flame and animal life, and the germination and growth of all kinds of vegetables.

These positions are proved and illustrated by such experiments as the following:—The general pressure of the atmosphere is proved by such experiments as those detailed in No. II. of the *Appendix*. The following experiment proves that air is *compressible*. If a glass tube, open at one end, and closed at the other, be plunged, with the open end downwards, into a tumbler of water, the water will rise a little way in the tube; which shows, that the air which filled the tube is compressed by the water into a smaller space. The *elasticity* of air is proved by tying up a bladder, with a very small quantity of air within it, and putting it under the receiver of an air-pump, when it will be seen gradually to inflate, till it becomes of its full size. A similar effect would take place, by carrying the bladder to the higher regions of the atmosphere. On the compression and elasticity of the air, depends the construction of that dangerous and destructive instrument, the air-gun.

That it is capable of being rarified by heat, is proved by holding to the fire a half-blown bladder, tightly tied at the neck, when it will dilate to nearly its full size; and if either a *full-blown* bladder, or a thin glass bubble filled with air is held to a strong fire, it will burst. The elasticity of the air is such, that Mr. Boyle, by means of an air-pump, caused it to dilate till it occupied fourteen thousand times the space that it usually does. That air is necessary to sound, flame, animal and vegetable life, is proved by the following experiments: When the receiver of an air-pump is exhausted of its air, a cat, a mouse, or a bird, placed in it, expires in a few moments,

in the greatest agonies. A bell rung in the same situation produces no sound; and a lighted candle is instantly extinguished. Similar experiments prove that air is necessary for the flight of birds; the ascent of smoke and vapours, the explosion of gunpowder, and the growth of plants; and that all bodies descend equally swift in a place void of air; a guinea and a feather being found to fall to the bottom of an exhausted receiver at the same instant.

On the principles which this science has established, have been constructed the air-pump, the barometer, the thermometer, the diving-bell, the hygrometer, the condenser, and various other instruments, which have contributed to the comfort of human life, and to the enlargement of our knowledge of the constitution of nature.

IV. *Acoustics*.—This science treats of the nature, the phenomena, and the laws of *sound*, and the theory of musical concord and harmony. From the experiments which have been made on this subject, we learn, that air is essential to the production of sound; that it arises from *vibrations* in the air, communicated to it by vibrations of the sounding body; that these vibrations, or aerial pulses, are propagated all around in a spherical undulatory manner; that their density decreases, as the squares of the distances from the sounding body increase; that they are propagated together in great numbers from different bodies, without disturbance or confusion, as is evident from concerts of musical instruments; that water, timber, and flannel, are also good conductors of sound; that sound travels at the rate of 1142 feet in a second, or about thirteen miles in a minute; that the softest whisper flies as fast as the loudest thunder; and that the utmost limits, within which the loudest sounds produced by artificial means can be heard, is 180 or 200 miles;\* that sound striking against an obstacle, as the wall of a house, may, like light, be reflected, and produce another sound, which is called an *echo*; and that, after it has been reflected from several places, it may be collected into one point or focus, where it will be more audible than in any other place. On these principles, whispering galleries, speaking trumpets, and other acoustic instruments, are constructed.

V. *Optics*.—This branch of philosophy treats of vision, light, and colours, and of the various phenomena of visible objects produced by the rays of light, reflected from mirrors, or transmitted through lenses. From this science we

\* In the war between England and Holland, in 1672, the noise of the guns was heard in those parts of Wales which were estimated to be two hundred miles distant from the scene of action. But the sounds produced by volcanoes have been heard at a much greater distance; some instances of which are stated in Chap. IV. Sect. 2. Several other facts in relation to sound are detailed in Chap. III. Art. *Acoustic Tunnels*.

learr, that light flies at the rate of nearly twelve millions of miles every minute—that it moves in straight lines—that its particles may be several thousands of miles distant from each other—that every visible body emits particles of light from its surface, in all directions—that the particles of light are *exceedingly small*; for a lighted candle will fill a cubical space of two miles every way with its rays, before it has lost the least sensible part of its substance; and millions of rays, from a thousand objects, will pass through a hole not larger than the point of a needle, and convey to the mind an idea of the form, position, and colour of every individual object—that the intensity or degree of light decreases, as the square of the distance from the luminous body increases; that is, at two yards' distance from a candle, we shall have only the fourth part of the light we should have at the distance of one yard; at three yards' distance, the ninth part; at four yards, the sixteenth part, and so on—that glass *lenses* may be ground into the following forms, *plano-convex, plano-concave, double convex, double concave, and meniscus*, that is, convex on one side, and concave on the other—that *specula*, or mirrors, may be ground into either a spherical, parabolical, or cylindrical form—that, by means of such mirrors and lenses, the rays of light may be so modified as to proceed either in a *diverging, converging, or parallel* direction, and the images of visible objects represented in a variety of new *forms, positions, and magnitudes*—that every ray of white light may be separated into seven primary colours: *red, orange, yellow, green, blue, indigo, and violet*—that the variegated colouring which appears on the face of nature is not in the objects themselves, but in the light which falls upon them—that the *rainbow* is produced by the refraction and reflection of the solar rays in the drops of falling rain—that the rays of light are refracted, or bent out of their course, when they fall upon glass, water, and other mediums—that the light of the sun may be collected into a point or focus, and made to produce a heat more intense than that of a furnace\*—that the rays from visible objects, when reflected from a concave mirror, converge to a focus, and paint an image of the objects before it, and that when they pass through a convex glass, they depict an image behind it.

\* This is produced by means of lenses, or mirrors of a large diameter, called burning-glasses. By these instruments the hardest metals, on which common fires, and even glass-house furnaces, could produce no effect, have been melted in a few seconds. M. Villette, a Frenchman, nearly a century ago, constructed a mirror, three feet eleven inches in diameter, and three feet two inches in focal distance, which melted *copper ore* in eight seconds, *iron ore* in twenty-four seconds, a fish's tooth in thirty-two seconds, *cast iron* in sixteen seconds, a silver sixpence in seven seconds, and *tin* in three seconds. This mirror condensed the solar rays 17,257 times, a degree of heat which is about *four hundred and ninety times* greater than common fire. Mr. Parker, of London, constructed a lens three feet in diameter,

On these and other principles demonstrated by this science, the Camera Obscura, the Magic Lantern, the Phantasmagoria, the Kaleidoscope, the Heliostata, the Micrometer—Spectacles, Opera-Glasses, Prisms, single, compound, lucernal, and solar Microscopes, reflecting and refracting Telescopes, and other optical instruments, have been constructed by means of which the natural powers of human vision have been wonderfully increased, and our prospects into the works of God extended far beyond what former ages could have conceived.

VI. *Electricity*.—This name has been given to a science which explains and illustrates the operations of a very subtle fluid called the *electric fluid*, which appears to pervade every part of nature, and to be one of the chief agents employed in producing many of the phenomena of the material world. If a piece of amber, sealing wax, or sulphur, be rubbed with a piece of flannel, it will acquire the power of attracting small bits of paper, feathers, or other light substances. If a tube of glass, two or three feet in length, and an inch or two in diameter, be rubbed pretty hard, in a dark room, with a piece of dry woollen cloth, besides attracting light substances, it will emit flashes of fire, attended with a crackling noise. This luminous matter is called electricity, or the *electric fluid*. If a large globe or cylinder of glass be turned rapidly round, and made to rub against a cushion, streams and large sparks of bluish flame will be elicited, which will fly round the glass, attract light bodies, and produce a pungent sensation if the hand be held to it. This glass, with all its requisite apparatus, is called an *electrical machine*. It is found, that this fluid will pass along some bodies, and not along others. The bodies over which it passes freely are, water, and most other fluids, except oil and the aerial fluids; iron, copper, lead, and in general all the metals, semi-metals, and metallic ores; which are, therefore, called *conductors* of electricity. But it will not pass over glass, resin, wax, sulphur, silk, baked woods, or dry woollen substances; nor through air, except by force, in *sparks*, to short distances. These bodies are, therefore, called *non-conductors*.

The following facts among others, have been ascertained respecting this wonderful agent:—That all bodies with which we are acquainted possess a greater or less share of this fluid—that the quantity usually belonging to any body produces no sensible effects; but when any surface

and six feet eight inches focus, which weighed 316 pounds. It melted twenty grains of gold in four seconds, and ten grains of platina in three seconds. The power of burning glasses is *as the area of the lens directly, and the square of the focal distance inversely*—or, in other words, the broader the mirror or lens, and the shorter the focal distance, the more intense is the heat produced by such instruments. A globular decanter of water makes a powerful burning-glass; and house furniture has been set on fire by incautiously exposing it to the rays of the sun.

becomes possessed of more or less than its natural share, it exhibits certain appearances, in the form of light, sound, attraction, or repulsion, which are ascribed to the power called *electric*—that there are two different species of the electrical fluid, or, at least two different modifications of the same general principle, termed *positive* and *negative* electricity—that positive and negative electricity always accompany each other; for if a substance acquire the one, the body with which it is rubbed acquires the other—that it moves with amazing rapidity; having been transmitted through wires of several miles in length, without taking up any sensible space of time; and, therefore, it is not improbable, that were an insulated conducting substance extended from one continent to another, it might be made to fly to the remotest regions of the earth in a few seconds of time—that it has a power of suddenly contracting the muscles of animals, or of giving a *shock* to the animal frame—that this shock may be communicated, at the same instant, to a hundred persons, or to an indefinite number who form a circle, by joining their hands together—that it may be accumulated to such a degree as to kill the largest animals—that vivid sparks of this fluid, attended with a crackling noise, may be drawn from different parts of the human body, when the person is *insulated*, or stands upon a stool, supported by glass feet—that electricity sets fire to gunpowder, spirits of wine, and other inflammable substances—that it melts iron wire, and destroys the polarity of the magnetic needle—that it augments the natural evaporation of fluids, promotes the vegetation of plants, and increases the insensible perspiration of animals, and can be drawn from the clouds by means of electrical kites, and other elevated conductors. By means of the electrical power, small models of machinery have been set in action: orreries to represent the movements of the planets, have been put in motion; and small bells have been set a ringing for a length of time; and, in consequence of the knowledge we have acquired of the mode of its operation in the system of nature, the lightnings of heaven have been arrested in their course, and constrained to descend to the earth, without producing any injurious effects.

From these, and a variety of other facts and experiments, it is now fully ascertained, that *lightning* and electricity are identical; and that it is the prime agent in producing the awful phenomena of a thunder-storm; the lightning being the rapid motion of vast masses of electric matter, and *thunder* the noise, with its echoes, produced by the rapid motion of the lightning through the atmosphere. There can be little doubt that, in combination with steam, the gases, and other agents, it also produces many of the terrific phenomena of earthquakes, volcanoes, whirlwinds, water-spouts, and hurricanes, and the sublime coruscations of the *aurora borealis*. In the op-

rations of this powerful fluid we behold a striking display of the sovereignty and majestic agency of God. In directing its energies, "his way is in the whirlwind and the storm, and the clouds are the dust of his feet; the heavens are covered with sackcloth, the mountains quake before him, the hills melt, the earth is burned at his presence, and the rocks are thrown down by him." Nah. i. 3—6. It is easy to conceive, that, by a few slight modifications produced by the hand of Omnipotence, this powerful fluid might become the agent of producing either the most awful and tremendous, or the most glorious and transporting scenes, over every region of our globe. As it now operates, it is calculated to inspire us rather with awe and terror than with admiration and joy; and to lead our thoughts to a consideration of the state of man as a depraved intelligence, and a rebel against his Maker.

VII. *Galvanism* is intimately connected with electricity, though it is generally considered as a branch of chymistry. It is only another mode of exciting electrical action. In electricity the effects are produced chiefly by *mechanical* action; but the effects of galvanism are produced by the *chymical* action of bodies upon each other. If we take a piece of zinc, and place it under the tongue, and lay a piece of silver, as big as a half-crown, above it; by bringing the outer edges of these pieces in contact, we shall immediately experience a peculiar and disagreeable taste, like that of copper. The same thing may be noticed with a guinea and a piece of charcoal. If a person, in the dark, put a slip of tinfoil upon one of his eyes, and a piece of silver in his mouth, by causing these pieces to communicate, a faint flash will appear before his eyes. If a living frog or fish, having a slip of tinfoil pasted upon its back, be placed upon a piece of zinc, by forming a communication between the zinc and tinfoil, the spasms of the muscles are excited. These and similar effects are produced by that modification of electricity which has been termed *galvanism*. Three different conductors, or what is called a *galvanic circle*, are requisite to produce such effects. A piece of copper, a piece of flannel, moistened with water or acid, and a piece of zinc, laid upon one another, form a circle; and if this circle be repeated a number of times, a galvanic pile or battery may be formed capable of giving a powerful shock. The most common and convenient form, however, of a battery, is found to be a trough of baked wood, three or four inches deep and as many wide. In the sides are grooves, opposite to each other, into each of which is placed a double metallic plate, of zinc and copper soldered together, and the cells are then filled either with salt and water, or with a solution of nitrous acid and water.

By means of the galvanic agency, a variety of surprising effects have been produced. Gunpowder, cotton, and other inflammable sub-

stances, have been inflamed—charcoal has been made to burn with a most brilliant and beautiful white flame—water has been decomposed into its elementary parts—metals have been melted and set on fire—fragments of diamond, charcoal, and plumbago, have been dispersed, as if they had been evaporated—platina, the hardest and heaviest of the metals, has been melted as readily as wax in the flame of a candle—the sapphire, quartz, magnesia, lime, and the firmest compounds in nature, have been made to enter into fusion. Its effects on the animal system are no less surprising. When applied to a fowl or a rabbit, immediately after life is extinct, it produces the most strange and violent convulsions on the nervous and muscular system, as if the vital functions were again revived, and when applied to the human body after death, the stimulus has produced the most horrible contortions and grimaces in the muscles of the head and face, and the most rapid movements in the hands and feet.

The galvanic agency enables us to account for the following among other facts:—Why porter has a different and more pleasant taste, when drunk out of a pewter vessel, than out of glass or earthenware,—why a silver spoon is discoloured when used in eating eggs,—why the limbs of people, under amputation, are sometimes convulsed by the application of the instruments,—why pure mercury is oxydized when amalgamated with tin,—why works of metal, which are soldered together, soon tarnish in the places where the metals are joined,—and why the copper sheathing of ships, when fastened with iron nails, is soon corroded about the place of contact. In all these cases a galvanic circle is formed, which produces the effects. We have reason to believe, that, in combination with the discoveries which modern chymistry is daily unfolding, the agencies of this fluid will enable us to carry the arts forward towards perfection, and to trace the secret causes of some of the sublimest phenomena of nature.

**VIII. Magnetism.**—This department of philosophy describes the phenomena and the properties of the *loadstone*, or natural magnet. The natural magnet is a hard dark-coloured mineral body, and is usually found in iron mines. The following are some of its characteristic properties:—1. It attracts iron and steel, and all substances which contain iron in its metallic state. 2. If a magnet be suspended by a thread, or nicely poised on a pivot, or placed on a piece of wood, and set to float in a basin of water, one end will constantly point nearly towards the north pole of the earth, and the other towards the south; and hence those parts of the magnet have been called the *north* and *south poles*. 3. When the north pole of one magnet is presented near to the south pole of another, they will attract each other; but if the north pole of one be presented to the north pole of another, or a south

pole to a south, they will repel each other. 4. A magnet placed in such a manner as to be entirely at liberty, inclines one of its poles to the horizon, and of course elevates the other above it. This property is called the *dipping* of the magnet. 5. Magnets do not point directly north and south; but in different parts of the world with a different *declination* eastward or westward of the north; it is also different at the same place at different times. In London, and in most places of Great Britain, the magnetic needle, at present, points about 24 degrees to the west of north. For more than 160 years it has been gradually declining from the north to the west: but seems of late to have begun its declination to the eastward. 6. Any magnet may be made to communicate the properties now mentioned to any piece of iron or steel. For example, by gently rubbing a penknife with a magnet, it will be immediately invested with the property of attracting needles, or small pieces of iron or steel. 7. Heat weakens the power of a magnet, and the gradual addition of weight increases the magnetic power. 8. The properties of the magnet are not affected either by the presence or the absence of air; and the magnetic attraction is not in the least diminished by the interposition of any bodies except iron. A magnet will equally affect the needle of a pocket compass when a thick board is placed between them as when it is removed. It has been lately discovered, that the *violet rays of the solar spectrum*, when condensed with a convex glass, and made to pass along a piece of steel, have the power of communicating to it the magnetic virtue.

The cause which produces these singular properties of the magnet has hitherto remained a mystery; but the knowledge of the *polarity* of the magnet has been applied to a most important practical purpose. By means of it, man has now acquired the dominion of the ocean, and has learned to trace his course through the pathless deep to every region of the globe. There can be little doubt that magnetism has an intimate connexion with electricity, galvanism, light, heat, and chymical action; and the discoveries which have been lately made, and the experiments which are now making by Morichini, Oersted, Abraham, Hansteen, Barlow, Beaufoy, and Scoresby, promise to throw some light on this mysterious agent, and on the phenomena of nature with which it is connected.

Such is a faint outline of some of the interesting subjects which natural philosophy embraces. Its relation to religion will appear from the following considerations:

1. Its researches have led to the invention of machines, engines, and instruments of various kinds, which augment the energies, increase the comforts, and promote the general improvement of mankind; and these objects are inseparably connected with the propagation of Christianity.

through the world. If we admit, that, in future ages, the religion of the Bible will shed its benign influence over all nations—that the external condition of the human race will then be prosperous and greatly meliorated beyond what it has ever been—and, that no *miraculous interposition* of Deity is to be expected to bring about such desirable events—it will follow, that such objects can be accomplished only in the ordinary course of Providence, by rational investigations into the principles and powers of nature, and the application of the inventions of science to the great objects of religion and of human improvement, as I shall endeavour briefly to illustrate in the following chapter. As the destructive effects of many physical agents, in the present condition of our globe, are, doubtless, a consequence of the sin and depravity of man; we have reason to believe that, when the economy of nature shall be more extensively and minutely investigated, and the minds of men directed to apply their discoveries to philanthropic and religious objects, they will be enabled to counteract, in a great measure, those devastations and fatal effects which are now produced by several of the powers of nature. The general happiness of all ranks, which will be connected with the universal extension of Christianity, necessarily supposes that this object will be accomplished; for, were a dread of destruction from the elements of nature frequently to agitate the mind, as at present, no permanent tranquillity would be enjoyed; nor would that ancient prediction, in reference to this era, receive its full accomplishment, that “there shall be nothing to hurt or destroy in all God’s holy mountain, when the earth shall be full of the knowledge of the Lord.” And since miraculous interpositions are not to be expected, to what quarter can we look for those subordinate agencies by which this object is to be effected, but to the discoveries and inventions of philosophical science?

Science has already enabled us to remedy many of those evils which are the accidental effects of the operation of physical agents. For example—the discoveries of the philosopher, with respect to the nature of the electric fluid, have enabled us to construct conductors for preserving buildings from the stroke of lightning: and we have every reason to hope, that in the progress of electric, galvanic, and chymical science, more complete thunder-guards, applicable to all the situations in which a person may be exposed, will be invented. Nay, our increasing knowledge of the electric fluid, and of the chymical agents which concur in its operation, may enable us to dissipate thunder-storms altogether, by disturbing the electricity of the clouds by means of a series of elevated artificial conductors. This is not only possible, but has already been in some degree effected. The celebrated Euler informs us, in his “Letters to a German Princess,”

that he corresponded with a Moravian priest named *Divisch*, who assured him “that he had averted, during a whole summer, every thunder storm which threatened his own habitation and the neighbourhood, by means of a machine constructed on the principles of electricity—that the machinery sensibly attracted the clouds, and constrained them to descend quietly in a distillation, without any but a very distant thunder-clap.” Euler assures us that “the fact is undoubted, and confirmed by irresistible proof.” Yea, not only may the destructive effects of lightning be averted by the inventions of philosophy, but its agency may be rendered subservient to human industry, and made to act as a mechanical power. This effect, too, has been partially accomplished. About the year 1811, in the village of Philipsthal, in Eastern Prussia, an attempt was made to split an immense stone into a multitude of pieces, by means of lightning. A bar of iron, in the form of a conductor, was previously fixed to the stone, and the experiment was attended with the most complete success; for, during the very first thunder-storm, the lightning burst the stone without displacing it.\*

It is, therefore, probable, that in the future ages of the world, this terrific meteor, and other destructive agents, which now produce so much alarm, and so many disastrous effects, may, by the aid of philosophy, be brought under the control of man, and be made to minister to his enjoyment.

The electric fluid has also been, in many instances, successfully applied in curing palsies, rheumatisms, spasms, obstructions, and inflammation; and it is known to have a peculiar effect on the nervous system. Lightning has been known to restore the blind to a temporary enjoyment of sight. Mr. Campbell, of Succoth, in Dumbartonshire, who had been blind for several years, was led by his servant one evening through the streets of Glasgow, during a terrible thunder-storm. The lightning sometimes fluttered along the streets for a quarter of a minute without ceasing. While this fluttering lasted, Mr. C. saw the street distinctly, and the changes which had been made in that part by taking down one of the city gates. When the storm was over, his entire blindness returned. A still more remarkable instance is stated, along with this, under the article *Thunder*, in Dr. Gleig’s *Supp. to Ency. Brit.* which was written by the late Professor Robison. It is also possible that barren deserts might be enriched with fertility, and immense portions of the desolate wastes of our globe prepared for the support and accommodation of human beings, by arresting the clouds, and drawing down their electrical virtue and their watery treasures by means of an extended series of elevated metallic conductors. What has been now

\* See Monthly Magazine, vol. 22, p. 102

stated is only one instance, out of many, which might be adduced, of the extensive and beneficial effects which may be produced, in future ages, by the application of the discoveries of natural science.

2. A knowledge of natural philosophy enables us to detect *pretended* miracles, and to discriminate between those phenomena which are produced by the powers of nature, and the supposed effects of diabolical influence. It has been chiefly owing to ignorance of the principles of natural science, that mankind, in all ages, have been so easily imposed upon by pretenders to supernatural powers. It is owing to the same cause, that superstitious notions and vain alarms have spread their influence so extensively among the lower ranks of the population of every country. The pretended miracles by which Pagan and Popish priests endeavour to support the authority of their respective religious systems, and every species of degrading superstition, vanish into smoke, when examined by the light of modern science; and there can be no question that an enlightened missionary would, in many instances, find the principles and the instruments of natural philosophy important auxiliaries in undermining the fabric of heathen idolatry and priestcraft. They tend to dissipate a thousand idle terrors which haunt and agitate the human mind; to detect a thousand kinds of imposture by which it has been held in cruel bondage, and to prevent the perpetration of those deeds of cruelty which have uniformly marked the reign of superstition.\* Had our forefathers connected a knowledge of this subject with their study of the Scriptures, they would not have brought upon themselves that indelible disgrace which now attaches to their memories, on account of their having condemned and burned at the stake hundreds of unhappy women, accused of crimes of which they could not possibly have been guilty. In New-England, towards the close of the 17th century, the witchcraft phrensy rose so high, that the execution of witches became a calamity more

\* Mr. Douglas, in his "Hints on Missions," formerly referred to, when speaking of the facilities which Christians now possess for extensive missionary exertions, suggests, that natural philosophy might be an important auxiliary to Christian missionaries. "All the ancient 'war weapons of victory,' excepting miracles, are at their disposal; and new instruments of still greater potency, which the science of the latter days has been accumulating for a universal revolution of the mind, are ready to be brought into action, upon a scale of overpowering magnitude. Even the single resource which is lost may yet be recompensed by equivalents, and a substitute, in many respects, may be found for miracles. The first effect of a miracle is, to rouse the attention, and to overawe opposing prejudices; the second to afford a proof of the religion of which it is a sealing accompaniment. *The first object might be gained by the natural magic of experimental philosophy;* and as to the second, the difference in the proof from miracles lies rather in its being more circuitous, than in its being less conclusive at the present day than in the times of the apostles."

dreadful than the sword or the pestilence. Not only old women, but children of ten years, were put to death; young girls were stripped naked, and the marks of witchcraft searched for upon their bodies with the most indecent curiosity; and those spots of the scurvy which age impresses upon the bodies of old men, were taken for evident signs of infernal power. So that ignorance of the laws and phenomena of nature has led even Christians to commit acts of injustice and horrid cruelty. For, let it be remembered, that it was *Christian* magistrates and ministers, under a pretended zeal for the honour of God, who sanctioned such cruel and unrighteous decrees. This consideration, viewed in connexion with many others, tends to show, that the Christian revelation, considered abstractly by itself, without a reference to the visible system of the universe, is not sufficient for all the purposes for which it was intended; as, on the other hand, the study of the works of nature is not sufficient of itself to lead the mind to the true knowledge of God, without the aid of the discoveries derived from the sacred oracles. For, although the Bible has been in the hands of Protestant Christians ever since the reformation, yet it is only since the light of modern science began to diffuse its influence, that the superstitions of the dark ages, and the vulgar notions respecting witchcraft, necromancy, and other species of infernal agency, began to vanish, even from the minds of Christian teachers; as is evident from the writings of many eminent divines who flourished during the 16th and 17th centuries. As the two revelations which God has given us throw a mutual lustre on each other; the one must always be considered as incomplete without the other. Both are necessary in order "to make the man of God perfect," and to enable him to prosecute, with intelligence and success, the great objects of religion; and the Christian minister who affects to despise the aids of science in the cause of religion, has yet much to learn with respect to some of the grand bearings of the Christian system.

3. The investigations of natural philosophy unfold to us the *incessant agency of God*, and the plans by which his wise and benevolent designs in the system of nature are accomplished. From the immeasurable globes of heaven, down to the minutest atoms, we perceive a regular chain of causes and effects, conspiring, in a thousand different modes, to accomplish the purposes of infinite wisdom and goodness. The operation of central forces and of the law of gravitation on the earth and in the heavens—the hydrostatical laws which regulate the pressure and the motion of fluids—the chymical properties of the atmosphere, its undulatory, refractive, and reflective powers—the motion of the rays of light, and the infinite variety of effects they produce—the process of evaporation—the agencies of electricity and galvanism—the properties of the magnet,

and the chymical action of acids and alkalies, and of the minutest particles of matter upon each other—ought to be viewed as so many modifications of the agency of Deity, and as manifestations of his wisdom, in carrying forward those plans which regard the interests of his universal kingdom; just as we consider the rise and fall of empires, the revolutions of nations, and the circulation of the Scriptures in heathen lands, as so many acts of his moral administration as the Governor of mankind. For let it be carefully remembered, that all these physical agencies have ultimately a moral and intellectual bearing; and are essentially connected with every other part of God's providential procedure. Though we may be apt to consider them as so many detached and insulated pieces of machinery, with which we have little concern, or may even disdain to notice their mode of operation; yet, in the all-comprehensive mind of Him who takes in, at one glance, the whole chain of causes and effects, they are as essentially connected with his ultimate purposes, and the eternal destiny of man, as are the revelations of his word. Were a single principle or motion which now animates the system of nature to cease—were the agencies of electricity, for example, or the principle of evaporation, to be destroyed—the physical constitution of our globe would instantly be deranged; nature would be thrown into confusion; and the sentient and intellectual beings that now inhabit the earth would either be destroyed, or plunged into an abyss of misery. If, therefore, we admit that the moral agency of God is worthy of our contemplation, we ought to consider his physical operations also as no less worthy of our study and investigation; since they form the groundwork of all his other manifestations.

There is nothing, however, which so strikingly characterizes the bulk of mankind, and even the great mass of the Christian world, as that apathy and indifference with which they view the wonders of creation which surround them. They can look on all that is grand, and beautiful, and beneficent in nature, without feeling the least sentiment of admiration, or of gratitude to that Being who is incessantly operating within them and around them; and they are disposed to consider the experiments of philosophers, by which the wonderful agency of God is unveiled, as only so many toys and amusements for the entertainment of children. They would prefer the paltry entertainments of a card-table, of a ball-room, or of a gossiping party, to the inspection of the nicest pieces of divine mechanism, and to the contemplation of the most august scene in nature. However lightly some religionists may be disposed to treat this subject, that spirit of indifference with which the visible works of God are treated must be considered as flowing from the same *depraved principle* which leads multitudes to reject the revelations of the Bible, and to trifle

with their everlasting interests. "Man," says Rollin, "lives in the midst of a world of which he is the sovereign, as a stranger, who looks with indifference upon all that passes in it, and as if it was not his concern. The universe, in all its parts, declares and points out its Author; but, for the most part, to the deaf and blind, who have neither ears to hear, nor eyes to see. One of the greatest services that philosophy can do us, is to awaken us from this drowsiness, and rouse us from this lethargy, which is a dishonour to humanity, and in a manner reduces us below the beasts, whose stupidity is the consequence of their nature, and not the effect of neglect or indifference. It awakens our curiosity, it excites our attention, and leads us as it were by the hand, through all the parts of nature, to induce us to study and search out the wonderful works of it." —*Belles Lettres*, vol. 4.

Since, therefore, the science of natural philosophy is conversant about the works of the Almighty, and its investigations have a direct tendency to illustrate the perfections of his nature, to unveil the plan of his operations, to unfold the laws by which he governs the kingdom of universal nature, and to display the order, symmetry, and proportion, which reign throughout the whole—it would be needless to enter into any further process of reasoning, to show that the study of it is connected with the great objects of religion. Whatever studies tend to raise our minds to the Supreme Ruler of all worlds—to expand our views of his infinite knowledge and wisdom—to excite our gratitude and our admiration of the beneficent designs which appear in all his arrangements—to guard us against erroneous conceptions of his providential procedure—and to furnish us with important auxiliaries for extending the influence of his religion through the world; must always be interesting to every Christian who wishes to enlarge his intellectual views, and to make progress in the knowledge of God.

#### CHEMISTRY.

This science, which is intimately related to the preceding, has for its object to ascertain the ingredients, or first principles, of which all matter is composed—to examine the compounds formed by the combination of these ingredients—to investigate those changes in natural bodies, which are not accompanied with sensible motion, and the nature of the power which produces these combinations and changes.

Within the limits of the last half century, the empire of chymistry has been wonderfully extended. From an obscure and humble place among the objects of study, it has risen to a high and dignified station among those sciences which improve and adorn the human mind. No longer confined to the paltry and mercenary object of searching for the philosopher's stone, or of furnishing a little amusement, it now extends its

sway over all the arts which minister to the comfort and improvement of social life, and over every species of animate and inanimate matter, within the range of human investigation. "The forms and appearances," (says Sir Humphrey Davy,) "of the beings and substances of the external world, are almost infinitely various, and they are in a state of continued alteration. Even the earth itself, throughout its whole surface, undergoes modifications. Acted on by moisture and air, it affords the food of plants; an immense number of vegetable productions arise from apparently the same materials; these become the substance of animals; one species of animal matter is converted into another; the most perfect and beautiful of the forms of organized life ultimately decay, and are resolved into inorganic aggregates; and the same elementary substances, differently arranged, are contained in the inert soil, or bloom and emit fragrance in the flower, or become in animals the active organs of mind and intelligence. In artificial operations, changes of the same order occur; substances having the characters of earth, are converted into metals; clays and sands are united, so as to become porcelain; earths and alkalis are combined into glass; acrid and corrosive matters are formed from tasteless substances; colours are fixed upon stuffs, or changed, or made to disappear; and the productions of the vegetable, mineral, and animal kingdoms are converted into new forms, and made subservient to the purposes of civilized life. To trace, in detail, these diversified and complicated phenomena; to arrange them, and deduce general laws from their analogies, is the business of chymistry."—*Elements of Chymical Philosophy.*

Chymists have arranged the *general forms of matter* into the four following classes. The *first* class consists of *Solids*, which form the principal parts of the globe, and which differ from each other in hardness, colour, opacity, transparency, density, and other properties. The *second* class consists of *Fluids*, such as water, oils, spirits, &c., whose parts possess freedom of motion, and require great mechanical force to make them occupy a smaller space. The *third* class comprehends *Elastic Fluids*, or *Gases*, which exist freely in the atmosphere; but may be confined by solids and fluids, and their properties examined. Their parts are highly moveable, compressible, and expansive; they are all transparent; they present two or three varieties of colour; and they differ greatly in density. The *fourth* class comprehends *Ethereal Substances*, which are known to us only in their states of motion, when acting upon our organs of sense, and which are not susceptible of being confined. Such are the *rays of light*, and *radiant heat*, which are incessantly in motion, throughout the spaces that intervene between our globe and the sun and the stars. Chymists divide the substances in nature

also into *simple* and *compound*. *Simple Substances* are those which have never yet been decomposed, nor formed by art. *Compound Substances* are those which are formed by the union of two or more simple substances. The following are all the *simple* substances, with which we are at present acquainted: *Caloric, Light, Oxygen, Nitrogen, Carbon, Hydrogen, Sulphur, Phosphorus*, the *Metals*, and some of the *Earths*. All that I propose, under this article, is, simply to state some of the properties of two or three of these simple substances.

*Caloric*, or elementary fire, is the name now given by chymists to that element or property which, combined with various bodies, produces the sensation of *heat*, while it is passing from one body to another. This substance appears to pervade the whole system of nature. There are six different sources, from whence caloric may be procured. It may be produced by *combustion*, in which process the oxygen gas of the atmosphere is decomposed, and caloric, one of its component parts, set at liberty—by *friction*, or the rubbing of two substances against each other—by *percussion*, as the striking of steel against a piece of flint—by the *mixture of two or more substances*; as when sulphuric acid is poured upon water or magnesia—by *electricity* and *galvanism*. The discharge of an electric or galvanic battery will produce a more intense degree of heat than any other means whatever. But the principal, and probably the original source of caloric, is the *Sun*, which furnishes the earth with a regular supply for the support and nourishment of the animal and vegetable tribes. From this source it moves at the rate of 195,000 miles in a second of time; for it has been already stated, that the sun sends forth rays of heat, which are distinct from those which produce illumination, and which accompany them in their course through the ethereal regions.

Caloric is the cause of *fluidity*, in all substances which are capable of becoming fluid. A certain portion, or *does* of it, reduces a solid body to the state of an incompressible fluid; a larger portion brings it to the state of an aeriform or gaseous fluid. Thus, a certain portion of caloric reduces ice to a state of water; a larger portion converts it into steam or vapour. There is reason to believe that the hardest rocks, the densest metals, and every solid substance on the face of the earth, might be converted into a fluid, and even into a gas, were they submitted to the action of a very high temperature. This substance is called *sensible* caloric, when it produces the sensation of *heat*; and *latent* caloric, when it forms an insensible part of the substance of bodies. All bodies are, in a greater or less degree, *conductors* of caloric. Metals and liquids are good conductors of heat, but silk, cotton, wool, wood, &c. are bad conductors of it. For example, if we put a short po-

ker into the fire at one end, it will soon become hot at the other ; but this will not happen with a piece of wood of the same length, and under the same circumstances. A person with a silken purse, containing metal coin, may stand so near the fire, as to make the metal almost too hot to touch, though the temperature of the purse will apparently be scarcely altered. If a hand be put upon a hot body, part of the caloric leaves the hot body and enters the hand, producing the sensation of heat. On the contrary, if a hand be put on a cold body, as a piece of iron, or another cold hand, part of the caloric contained in the hand leaves it to unite with the colder body, producing the sensation of cold. In short, caloric is diffused throughout all bodies, and enters into every operation in nature ; and were it not for the influence of this subtile fluid, there is reason to believe, that the whole matter of the universe would be condensed into a solid mass.

Oxygen is a very pure, subtile, and elastic substance, generally diffused throughout nature ; but is never found unless in combination with other substances. It is one of the most important agents in nature ; there being scarcely a single process, whether natural or artificial, in which oxygen has not some important share. When combined with caloric, it is called *oxygas*, which forms one of the constituent parts of the atmosphere. In this state, it forms the principle of combustion ; producing the most rapid deflagration of all combustible substances. If a lighted taper be let down into a jar of oxygen gas, it burns with such splendour, that the eye can scarcely bear the glare of light ; and at the same time produces a much greater heat than when burning in common air. If a steel wire, or a thin file, having a sharp point, armed with a bit of wood in inflammation, be introduced into a jar filled with this gas, the steel will take fire, and its combustion will continue, producing a most brilliant phenomenon. It has been proved, by numerous experiments, that this gas is so essential to combustion, that no substance will burn in common air, which has been previously deprived of its oxygen. It is also essential to animal life ; so that man, and all the inferior ranks of animated nature, may be said to depend upon this fluid for their existence. Its basis gives the acid character to all mineral and vegetable salts : and the calcination of metals is altogether effected by their union with oxygen. It constitutes the basis both of the atmosphere which surrounds the earth, and of the water which forms its rivers, seas, and oceans. It pervades the substance of all the vegetable tribes, and enables them to perform their functions ; and, in combination with the different metals, serves the most important purposes in the useful arts. In the operation of this elementary principle, we perceive a striking display of the agency of the Creator, and of the admirable

means which his wisdom has contrived for preserving, in due order, the system of nature. And, as this wonderful substance is so essentially necessary to animal and vegetable existence, every thing is so arranged as to produce a regular supply of it, notwithstanding its incessant changes, and the multifarious combinations into which it is continually entering.

One of the most extraordinary effects of oxygen appears, when it is combined in a certain proportion with nitrogen, so as to form the gaseous oxide of nitrogen, or what is commonly called *nitrous oxide*. This gas consists of 63 parts nitrogen, and 37 oxygen, by weight. When inhaled into the lungs, it produces an extraordinary elevation of the animal spirits, a propensity to leaping and running, involuntary fits of laughter, a rapid flow of vivid ideas, and a thousand delightful emotions ; without being accompanied with any subsequent feelings of debility. This circumstance shows what a variety of delightful or pernicious effects might flow from the slightest change in the constitution of the atmosphere, were the hand of the Almighty to interpose in altering the proportion of its constituent parts : for atmospheric air is composed of 79 parts of nitrogen, and 21 of oxygen, which is not a very different proportion from the above. Another gas called *nitric oxide*, composed of 56 parts oxygen, and 44 nitrogen, produces instant suffocation in all animals that attempt to breathe it. One of the most corrosive acids, the *nitrous acid*, or *aqua fortis*, is composed of 75 parts oxygen and 25 parts nitrogen ; so that we are every moment breathing a certain substance, which, in another combination, would produce the most dreadful pain, and cause our immediate destruction. What a striking proof does this afford of the infinite comprehension of the divine mind, in foreseeing all the consequences of the elements of nature, and in directing their numerous combinations in such a manner as to promote the happiness of animated beings !

*Nitrogen*, or *azote*, is a substance generally diffused throughout nature, and particularly in animated bodies. It is not to be found in a solid or liquid state, but, combined with caloric, it forms *nitrogen gas*, which is one of the ingredients of the atmosphere. It is capable of supporting either flame or animal life. This is proved by introducing an animal, or a burning candle, into a vessel full of this gas : in which case, the animal is suddenly suffocated, and the candle instantly extinguished. It is this gas which is expelled from the lungs at every respiration, and, rising over our heads, soon enters into new combinations. Though it is destructive to animal life, it appears to be favourable to plants, which vegetate freely when surrounded with nitrogen.

*Hydrogen* is another elementary substance, abundant in nature, and, when united to caloric

forms hydrogen gas. It is one of the constituent parts of water; for it has been completely demonstrated by experiment, that water is composed of 85 parts by weight of oxygen, and 15 of hydrogen, in every hundred parts of the fluid. This gas was formerly known by the name of *inflammable air*. It is distinguished among miners by the name of *fire-damp*; it abounds in coal-mines, and sometimes produces the most tremendous explosions. It is incapable, by itself, of supporting combustion, and cannot be breathed without the most imminent danger. It is the chief constituent of oils, fats, spirits, ether, coals, and bitumen; and is supposed to be one of the agents which produce the *ignes fatui* and the *northern lights*. It is the *lightest* of all ponderable bodies; being from twelve to fifteen times lighter than common air. A hundred cubic inches of it weigh about  $2\frac{1}{2}$  grains. On account of its great levity it is used for filling *air-balloons*. In contact with atmospheric air, it burns with a pale blue colour. When mixed with oxygen gas, it may be exploded like gunpowder, with a violent report. *Carburated hydrogen gas*, which is carbon dissolved in hydrogen, is that beautiful gas, which is now employed in lighting our streets, shops, and manufactories.

Carbon is another simple substance extensively diffused throughout nature. It is found pure and solid only in the *diamond*; but it may be procured in the state of *charcoal*, by burning a piece of wood closely covered with sand, in a crucible. Carbon enters into the composition of bitumen and pit coal, and of most animal and some mineral substances; and it forms nearly the whole of the solid basis of all vegetables, from the most delicate flower to the stately oak. It is also a component part of sugar, and of all kinds of wax, oils, gums, and resins. It combines with iron in various proportions, and the results are cast iron and steel. Black lead is a composition of nine parts of carbon to one of iron; and is, therefore, called a *carburet* of iron. Carbon is *indestructible* by age, and preserves its identity in all the combinations into which it enters. *Carbonic acid gas* is a combination of carbon and oxygen. It is found in a state of combination with lime, forming limestone, marble, and chalk; and may be separated from them by heat, or by means of the mineral acids. This gas, which was formerly called *fixed air*, is found in mines, caves, the bottoms of wells, wine cellars, brewers' vats, and in the neighbourhood of lime-kilns. It is known to miners by the name of the *choke-damp*, and too frequently runs on deadly errands. It extinguishes flame and animal life. It is the heaviest of all the gases; being nearly twice the weight of common air, and twenty times the weight of hydrogen. It may, therefore, be poured from one vessel to another; and if a small quantity of it be poured upon a lighted taper, it will be instantly extinguished. It is a

powerful antiseptic, or preserver from putrefaction. Meat which has been sealed up in it (says Mr. Parkes) has been known to have preserved its texture and appearance for more than twenty years. There is no substance of more importance in civilized life than the different forms of Carbon. "In nature," says Sir. H. Davy, "this element is constantly active in an important series of operations. It is evolved in fermentation and combustion, in carbonic acid; it is separated from oxygen in the organs of plants; it is a principal element in animal structures; and is found in different forms in almost all the products of organized beings."

Sulphur is a substance which has been known from the earliest ages. It was used by the ancients in medicine, and its fumes have, for more than 2000 years, been employed in bleaching wool. It is found combined with many mineral substances, as arsenic, antimony, copper, and most of the metallic ores. It exists in many mineral waters, and in combination with vegetable and animal matters, but is most abundant in volcanic countries, particularly in the neighbourhood of Vesuvius, Etna, and Hecla in Iceland. It is a solid, opaque, combustible substance, of a pale yellow colour, very brittle, and almost without taste or smell. Its specific gravity is nearly twice that of water; it is a non-conductor of electricity, and, of course, becomes electric by friction. When heated to the temperature of  $170^{\circ}$  of Fahrenheit's thermometer, it rises up in the form of a fine powder, which is easily collected in a proper vessel, and is named the *flowers of sulphur*. It is insoluble in water, but may be dissolved in oils, in spirit of wine, and in hydrogen gas. When sulphur is heated to the temperature of  $302^{\circ}$  in the open air, it takes fire spontaneously, and burns with a pale blue flame, and emits a great quantity of fumes of a strong suffocating odour. When heated to the temperature of  $570^{\circ}$ , it burns with a bright white flame, and emits a vast quantity of fumes. When these fumes are collected, they are found to consist entirely of *sulphuric acid*; so that sulphur, by combustion, is converted into an acid. It is the base of several compound substances. It unites with oxygen, hydrogen, nitrogen, phosphorus, the alkalis, the metals, and some of the earths. This substance is of great importance in medicine, as it is found to penetrate to the extremities of the most minute vessels, and to impregnate all the secretions. It is also used in the arts, particularly in bleaching and dying; it forms a very large proportion of gunpowder; and one of its most common, but not least useful properties, is that of its combustibility, by which, with the help of a tinder-box, light is almost instantaneously produced. As this substance has not yet been decomposed, it is considered by chymists, in the mean time, as one of the simple substances.

Phosphorus is another simple-combustible substance, but is never found in a pure state in nature. It is commonly united to oxygen in a state of phosphoric acid, which is found in different animal, vegetable, and mineral substances. It was first discovered by Brandt, a chymist of Hamburgh, in the year 1667, and afterwards by the Honourable Mr. Boyle, in 1679. It was formerly obtained by a disgusting process; but it is now extracted from the bones of animals, by burning them, and then reducing them to a fine powder, and afterwards pouring sulphuric acid upon them. This substance, when pure, resembles bees' wax, being of a clear, transparent, yellowish colour; it is insoluble in water; it may be cut with a knife, or twisted to pieces with the fingers; and it is about double the specific gravity of water. Its most remarkable property is its very strong attraction for oxygen, from which circumstance, it burns spontaneously in the open air at the temperature of  $45^{\circ}$ ; that is, it attracts the oxygen gas from the atmosphere, and heat and flame are produced. It gradually consumes when exposed to the common temperature of air, emits a whitish smoke, and is luminous in the dark; for this reason it is kept in phials of water; and as the heat of the hand is sufficient to inflame it, it should seldom be handled except under water. At the temperature of  $99^{\circ}$  it melts; it evaporates at  $219^{\circ}$ , and boils at  $554^{\circ}$ . When heated to  $148^{\circ}$  it takes fire, and burns with a very bright flame, and gives out a very large quantity of white smoke, which is luminous in the dark; at the same time it emits an odour, which has some resemblance to that of garlic; and this smoke, when collected, is proved to be an acid. It burns with the greatest splendour in oxygen gas, and when taken internally, it is found to be poisonous. If any light substance, capable of conducting heat, be placed upon the surface of boiling water, and a bit of phosphorus be laid upon it, the heat of the water will be sufficient to set the phosphorus on fire. If we write a few words on paper with a bit of phosphorus fixed in a quill, when the writing is carried into a dark room it will appear beautifully luminous. If a piece of phosphorus, about the size of a pea, be dropped into a tumbler of hot water, and a stream of oxygen gas forced directly upon it, it will display the most brilliant combustion under water that can be imagined. All experiments with phosphorus, however, require to be performed with great caution. This substance is used in making phosphorus matches, phosphoric oil, phosphoric tapers, and various phosphoric fireworks. Phosphorized hydrogen gas is produced by bits of phosphorus remaining some hours in hydrogen gas. It is supposed to be this gas which is often seen hovering on the surface of burial grounds and marshes, known in Scotland by the name of *spunkie*, and in England by that of *will-o-the-wisp*.

Some animals, as the glow-worm and the fire-fly, and fish in a putrescent state, exhibit phosphorescent qualities. M. Peron describes a singular instance of this kind in an animal which he calls the *pyrosoma atlanticum*, which he observed in his voyage from Europe to the Isle of France. The darkness was intense when it was first discovered; and all at once there appeared at some distance, as it were, a vast sheet of phosphorus floating on the waves, which occupied a great space before the vessel. When the vessel had passed through this inflamed part of the sea, it was found that this prodigious light was occasioned by an immense number of small animals, which swam at different depths, and appeared to assume various forms. Those which were deepest looked like great red-hot cannon balls, while those on the surface resembled cylinders of red-hot iron. Some of them were caught, and were found to vary in size from three to seven inches. All the exterior surface of the animal was bristled with thick long tubercles, shining like so many diamonds; and these seemed to be the principal seat of its wonderful phosphorescence.

Such is a brief description of the principal elementary substances, which, in a thousand diversified forms, pervade the system of nature, and produce all that variety which we behold in the atmosphere, the waters, the earth, and the various processes of the arts. It is probable that some of these substances are compounds, though they have not yet been decomposed. Yea, it is possible, and not at all improbable, that there are but two, or at most three, elementary substances in nature, the various modifications of which produce all the beauties and sublimities in the universe. Perhaps caloric, oxygen, and hydrogen, may ultimately be found to constitute all the elementary principles of nature. Without prosecuting this subject farther, I shall conclude this article with a few cursory reflections, tending to illustrate its connexion with religion.

The remarks which I have already thrown out in reference to natural philosophy will equally apply to the science of chymistry; and, therefore, do not require to be repeated. In addition to these, the following observations may be stated:—

1. This science displays, in a striking point of view, the wisdom and goodness of God, in producing, by the most simple means, the most astonishing and benevolent effects. All the varied phenomena we perceive, throughout the whole system of sublunary nature, are produced by a combination of six or seven simple substances. I formerly adverted to the infinite variety which exists in the vegetable kingdom. (see pp. 37, 38.) About fifty-six thousand different species of plants have already been discovered by botanists. All these, from the humble shrub to the cedar of Lebanon, which adorn the surface of the globe, in every clime, with

such a diversity of forms, shades, and colours, are the result of the combinations of "four or five natural substances—caloric, light, water, air, and carbon." "When we consider," says Mr. Parkes, "that the many thousand tribes of vegetables are not only all formed from a few simple substances, but that they all enjoy the same sun, vegetate in the same medium, and are supplied with the same nutriment, we cannot but be struck with the rich economy of Nature, and are almost induced to doubt the evidence of those senses with which the God of nature has furnished us. That it should be possible so to modify and intermingle a few simple substances, and thence produce all the variety of form, colour, odour, &c. which are observable in the different families of vegetables, is a phenomenon too astonishing for our comprehension. Nothing short of Omnipotence could have provided such a paradise for man."—*Chymical Catechism*, chap. 9.

Soft roll your incense, herbs, and fruits, and flowers,  
In mingled clouds to Him, whose sun exalts,  
Whose breath perfumes you, and whose pencil paints."  
Thomson.

What an admirable view is here opened up of the economy of divine wisdom, and of the beneficent care which has been taken to secure the comfort and happiness of every living creature: and how ungrateful a disposition must it indicate in rational beings to overlook such benevolent arrangements! It is highly probable, that in all other worlds disposed throughout the universe an infinite diversity of scenery exists, and that no one globe or system exactly resembles another; and yet, it is probable, that the primary elements of matter, or the few simple substances of which our world is composed, may be of the same nature as those which form the constituent parts of every other system; and may give birth to all the variety which exists throughout the wide extent of creation, and to all the changes and revolutions through which the different systems may pass, during every period of infinite duration.

2. From this science we have every reason to conclude, that matter is indestructible. In the various changes that take place in material substances, the particles of matter are not destroyed, but only assume new forms, and enter into new combinations. When a piece of wood, for example, is burned to ashes, none of its principles are destroyed; the elementary substances of which it was composed are only separated from one another, and formed into new compounds. Carbon, as already stated, appears to be indestructible by age, and to preserve its essential properties in every mode of its existence. That Being, indeed, who created matter at first, may reduce it to nothing when he pleases; but it is highly improbable that his power will ever be interposed to produce this effect; or that any

particle of matter which now exists will ever be annihilated, into whatever new or varied combinations it may enter. When any particular world, or assemblage of material existence, has remained in its original state for a certain period of duration, and accomplished all the ends it was intended to subserve in that state, the materials of which it is composed will, in all probability, be employed for creating a new system, and establishing a new series of events, in which new scenes, and new beauties and sublimities, will arise from new and varied combinations. For the Creator does nothing in vain. But to annihilate, and again to create, would be operating in vain; and we uniformly find, that in all the arrangements of Deity in the present state of things, Nature is frugal and economical in all her proceedings; so that there is no process, when thoroughly investigated, that appears unnecessary or superfluous.

From the fact, that matter appears to be indestructible, we may learn, that the Creator may, with the self-same materials which now exist around us, new-model and arrange the globe we inhabit, after the general conflagration, so as to make a more glorious world to arise out of its ashes; purified from those physical evils which now exist; and fitted for the accommodation either of renovated men, or of other pure intelligences. From the same fact, combined with the consideration of the infinite diversity of effects which the simple substances of nature are capable of producing, we may be enabled to form a conception of the ease with which the Creator may new-model our bodies, after they have been dissolved in the dust; and how, from the same original atoms, he may construct and adorn them with more glorious forms and more delightful and exquisite senses than they now possess.

In short, the rapid progress which chymical science is now making, promises, ere long, to introduce improvements among the human race, which will expand their views of the agency of God, counteract many physical evils, and promote, to an extent which has never yet been experienced, their social and domestic enjoyment. The late discoveries of chymistry tend to convince us, that the properties and powers of natural subjects are only beginning to be discovered. Who could have imagined, a century ago, that an invisible substance is contained in a piece of coal, capable of producing the most beautiful and splendid illumination—that this substance may be conveyed, in a few moments, through pipes of several miles in length—and that a city, containing several hundred thousands of inhabitants, may be instantly lighted up by it, without the aid of either wax, oil, or tallow? Who could have imagined, that one of the ingredients of the air we breathe is the principle of combustion—that a rod of iron may be made to

burn with a brilliancy that dazzles the eye—that a piece of charcoal may be made to burn with a white and splendid light, which is inferior only to the solar rays—and that the diamond is nothing more than carbon in a crystallized state, and differs only in a slight degree from a bit of common charcoal? Who could have surmised, that a substance would be discovered, of such a degree of levity, as would have power sufficient to buoy up a number of men to the upper parts of the atmosphere, and enable them to swim, in safety, above the regions of the clouds? These are only specimens of still more brilliant discoveries which will, doubtless, be brought to light by the researches of future generations. We have reason to believe, that the investigations of this science will, in due time, enable us to counteract most of the diseases incident to the human frame; and to prevent many of those fatal accidents to which mankind are now exposed. Davy's safety lamp has already preserved many individuals from destruction, when working in coal mines; and thousands, in after ages, will be indebted to this discovery, for security from the dreadful explosions of hydrogen gas. And, we trust, that the period is not far distant, when specific antidotes to the diseases peculiar to the different trades and occupations in which mankind are employed will be discovered; and the health and vigour of the mass of society be preserved unimpaired, amidst all the processes in which they may be engaged. In fine, the rapid progress of chymical discovery carries forward our views to a period, when man, having thoroughly explored the powers of nature, and subjected them, in some measure, to his control, will be enabled to ward off most of those physical evils with which he is now annoyed, and to raise himself, in some degree, to the dignity and happiness he enjoyed before moral evil had shed its baleful influence on our terrestrial system. Such a period corresponds to many of the descriptions contained in the Sacred Oracles of the millennial state of the church; when social, domestic, moral, and intellectual improvement shall be carried to the utmost perfection which our sublunary station will permit; when wars shall cease; when the knowledge of Jehovah shall cover the earth; when every man shall sit under his vine and fig-tree, without being exposed to the least alarm; and when there shall be nothing to hurt nor destroy throughout the church of the living God. And, therefore, we ought to consider the various discoveries and improvements now going forward in this and other departments of science, as preparing the way for the introduction of this long-expected and auspicious era.

#### ANATOMY AND PHYSIOLOGY.

The general object of both these sciences is  
 • investigate and describe the structure and

economy of the animal frame. *Anatomy* dissects dead bodies, *physiology* investigates the functions of those that are living. The former examines the fluids, muscles, viscera, and all the other parts of the human body, in a state of rest, the latter considers them in a state of action.

The parts of the human body have been distinguished into two different kinds—solids and fluids. The solid parts are bones, cartilages, ligaments, muscles, tendons, membranes, nerves, arteries, veins, hair, nails, and ducts, or fine tubular vessels of various kinds. Of these solid parts, the following compound organs consist; the brain and cerebellum; the lungs; the heart, the stomach; the liver; the spleen; the pancreas; the glands; the kidneys; the intestines; the mesentery; the larynx; and the organs of sense—the eyes, ears, nose, and tongue. The fluid parts are, the saliva, or spittle, phlegm, serum, the chyle, blood, bile, milk, lymph, urine, the pancreatic juice, and the aqueous humour of the eyes. The human body is divided into three great cavities—the head; the thorax, or breast; and the abdomen, or belly. The head is formed of the bones of the cranium, and encloses the brain and cerebellum. The thorax is composed of the vertebrae of the back, the sternum, and true ribs; and contains the heart, the pericardium, the breast, and the lungs. The abdomen is separated from the thorax by means of the diaphragm, which is a fleshy and membranous substance, composed, for the most part, of muscular fibres. This cavity is formed by the lumbar vertebrae, the os sacrum, the ossa innominata, the false ribs, the peritoneum, and a variety of muscles. It encloses the stomach, intestines, omentum, or caul, the liver, pancreas, spleen, kidneys, and urinary bladder. Without attempting any technical description of these different parts, which could convey no accurate ideas to a general reader, I shall merely state two or three facts in relation to the system of bones, muscles, and blood-vessels, as specimens of the wonderful structure of our bodily frame.

The Bones may be regarded as the prop-work or basis on which the human body is constructed. They bear the same relation to the animal system, as the wood-work to a building. They give shape and firmness to the body; they support its various parts, and prevent it from sinking by its own weight; they serve as levers for the muscles to act upon, and to defend the brain, the heart, the lungs, and other vital parts, from external injury. Of the bones, some are hollow, and filled with marrow; others are solid throughout; some are very small—others very large; some are round, and others flat; some are plane, and others convex or concave;—and all these several forms are requisite for the situations they occupy, and the respective functions they have to perform. The spine, or back-bone, consists of 24 vertebrae, or small bones connected together by

cartilages, articulations, and ligaments; of which seven belong to the neck, twelve to the back, and five to the loins. In the centre of each vertebra there is a hole for the lodgment and continuation of the spinal marrow, which extends from the brain to the rump. From these vertebræ the arched bones called ribs proceed; and seven of them join the breast-bone on each side, where they terminate in cartilages, and form the cavity of the thorax or chest. The five lower ribs, with a number of muscles, form the cavity of the abdomen, as above stated. The spine is one of the most admirable mechanical contrivances in the human frame. Had it consisted of only three or four bones, or had the holes in each bone not exactly corresponded and fitted into each other, the spinal marrow would have been bruised, and life endangered at every bending of the body. The skull is composed of ten bones, and about 51 are reckoned to belong to the face, the orbits of the eyes, and the jaws in which the teeth are fixed. There are seldom more than 16 teeth in each jaw, or 32 in all. The number of bones in a human body is generally estimated at about 245; of which there are reckoned, in the skull, head, and face, 61; in the trunk, 64; in the arms, and hands, 60; in the legs, and feet, 60. The bones are provided with ligaments or hinges, which bind and fasten them together, and prevent them from being displaced by any violent motion; and, that the ligaments may work smoothly into one another, the joints are separated by cartilages or gristles, and provided with a gland for the secretion of oil or mucus, which is constantly exuding into the joints; so that every requisite is provided by our benevolent Creator, to prevent pain, and to promote facility of motion. "In considering the joints," says Dr. Paley, "there is nothing, perhaps, which ought to move our gratitude more than the reflection, *how well they wear*. A limb shall swing upon its hinge or play in its socket many hundred times in an hour, for 60 years together, without diminution of agility; which is a long time for any thing to last—for any thing so much worked as the joints are."

**The Muscular System.**—A muscle is a bundle of fleshy, and sometimes of tendinous fibres. The fleshy fibres compose the body of the muscle; and the tendinous fibres the extremities. Some muscles are long and round; some plain and circular; some are spiral, and some have straight fibres. Some are double, having a tendon running through the body from head to tail; some have two or more tendinous branches running through, with various rows and orders of fibres. All these, and several other varieties, are essentially requisite for the respective offices they have to perform in the animal system. The muscles constitute the fleshy part of the human body, and give it that varied and beautiful form we observe over all its surface. But their principal

design is to serve as the organs of motion. They are inserted, by strong tendinous extremities, into the different bones of which the skeleton is composed; and, by their contraction and distension, give rise to all the movements of the body. The muscles, therefore, may be considered as so many cords attached to the bones, and the Author of nature has fixed them according to the most perfect principles of mechanism, so as to produce the fittest motions in the parts for the movement of which they are intended.

One of the most wonderful properties of the muscles is, the extraordinary force they exert, although they are composed of such slender threads or fibres. The following facts, in relation to this point, are demonstrated by the celebrated Borelli, in his work, "*De Motu Animalium*." When a man lifts up with his teeth a weight of 200 pounds, with a rope fastened to the jaw-teeth, the muscles named *temporales* and *masseter*, with which people chew, and which perform this work, exert a force of above 15,000 lbs. weight. If any one hanging his arm directly downwards lifts a weight of 20 pounds, with the third or last joint of his thumb, the muscle which bends the thumb and bears that weight exerts a force of about *three thousand pounds*. When a man, standing upon his feet, leaps or springs upwards to the height of two feet, if the weight of such a man be 150 pounds, the muscles employed in that action will exert a force 2000 times greater; that is to say, a force of about *three hundred thousand pounds*. The heart, at each pulse or contraction, by which it protrudes the blood out of the arteries into the veins, exerts a force of above a *hundred thousand pounds*. Who can contemplate this amazing strength of the muscular system, without admiration of the power and wisdom of the Creator, who has thus endued a bundle of threads, each of them smaller than a hair, with such an astonishing degree of mechanical force! There have been reckoned about 448 muscles in the human body, which have been dissected and distinctly described; every one of which is essential to the performance of some one motion or other, which contributes to our ease and enjoyment; and, in most instances, a great number of them is required to perform their different functions at the same time. It has been calculated, that about a *hundred muscles* are employed every time we breathe. "Breathing with ease," says Dr. Paley, "is a blessing of every moment; yet, of all others, it is that which we possess with the least consciousness. A man in an asthma is the only man who knows how to estimate it."

**The Heart and Blood-vessels.**—The heart is a hollow muscular organ, of a conical shape, and consists of four distinct cavities. The two largest are called *ventricles*, and the two smallest *auricles*. The ventricles send out the blood to the arteries; the auricles receive it from the

veins. The heart is enclosed in the *pericardium*, a membranous bag, which contains a quantity of water, or lymph. This water lubricates the heart, and facilitates all its motions. The heart is the general reservoir of the blood. When the heart contracts, the blood is propelled from the *right ventricle* into the lungs, through the pulmonary arteries, which, like all the other arteries, are furnished with valves that play easily forward, but admit not the blood to return toward the heart. The blood, after circulating through the lungs, and having there been revived by coming in contact with the air, and imbibing a portion of its oxygen, returns into the *left auricle* of the heart, by the pulmonary vein. At the same instant, the *left ventricle* drives the blood into the *aorta*, a large artery which sends off branches to supply the head and arms. Another large branch of the *aorta* descends along the inside of the back-bone, and detaches numerous ramifications to nourish the bowels and inferior extremities. After serving the most remote extremities of the body, the arteries are converted into veins, which, in their return to the heart, gradually unite into larger branches, till the whole terminate in one great trunk, called the *vena cava*, which discharges itself into the *right auricle* of the heart, and completes the circulation. Each ventricle of the heart is reckoned to contain about one ounce, or two table-spoonfuls of blood. The heart contracts 4000 times every hour; and, consequently, there passes through it 250 pounds of blood in one hour. And if the mass of blood in a human body be reckoned at an average of twenty-five pounds, it will follow that *the whole mass of blood passes through the heart, and consequently through the thousands of ramifications of the veins and arteries, fourteen times every hour, or about once every four minutes.* We may acquire a rude idea of the force with which the blood is impelled from the heart, by considering the velocity with which water issues from a syringe, or from the pipe of a fire-engine. Could we behold these rapid motions incessantly going on within us, it would overpower our minds with astonishment, and even with terror. We should be apt to feel alarmed on making the smallest exertion, lest the parts of this delicate machine should be broken or deranged, and its functions interrupted. The arteries, into which the blood is forced, branch in every direction through the body, like the roots and branches of a tree; running through the substance of the bones, and every part of the animal frame, till they are lost in such fine tubes as to be wholly invisible. In the parts where the arteries are lost to the sight, the veins take their rise, and in their commencement are also imperceptible.

*Respiration.*—The organs of respiration are the *lungs*. They are divided into five lobes; three of which lie on the right, and two on the

left side of the thorax. The substance of the lungs is chiefly composed of infinite ramifications of the trachea, or windpipe, which, after gradually becoming more and more minute, terminate in little cells, or vesicles, which have a free communication with one another. At each inspiration, these pipes and cells are filled with air, which is again discharged by expiration. In this manner, a circulation of air, which is necessary to the existence of men and other animals, is constantly kept up as long as life remains. The air-cells of the lungs open into the windpipe, by which they communicate with the external atmosphere. The whole internal structure of the lungs is lined by a transparent membrane, estimated at only the thousandth part of an inch in thickness; but whose surface, from its various convolutions, measures fifteen square feet, which is equal to the external surface of the body. On this thin and extensive membrane innumerable veins and arteries are distributed, some of them finer than hairs; and through these vessels all the blood of the system is successively propelled, by a most curious and admirable mechanism. It has been computed, that the lungs, on an average, contain about 280 cubic inches, or about five English quarts of air. At each inspiration, about forty cubic inches of air are received into the lungs, and the same quantity discharged at each expiration. On the supposition that 20 respirations take place in a minute, it will follow, that, in one minute, we inhale 800 cubic inches; in an hour, 48,000; and in a day, one million, one hundred and fifty-two thousand cubic inches—a quantity which would fill seventy-seven wine hogsheads, and would weigh fifty-three pounds troy. By means of this function, a vast body of air is daily brought into contact with the mass of blood, and communicates to it its vivifying influence; and, therefore, it is of the utmost importance to health, that the air, of which we breathe so considerable a quantity, should be pure, and uncontaminated with noxious effluvia.

*Digestion.*—This process is performed by the *stomach*, which is a membranous and muscular bag, furnished with two orifices. By the one, it has a communication with the gullet, and by the other, with the bowels. The food, after being moistened by the saliva, is received into the stomach, where it is still farther diluted by the *gastric juice*, which has the power of dissolving every kind of animal and vegetable substance. Part of it is afterwards absorbed by the *lymphatic* and *lacteal* vessels, and carried into the circulating system, and converted into blood for supplying that nourishment which the perpetual waste of our bodies demands.

*Perspiration* is the evacuation of the juices of the body through the pores of the skin. It has been calculated that there are above *three hundred thousand millions of pores* in the glands of the

skin which covers the body of a middle-sized man. Through these pores, more than one-half of what we eat and drink passes off by *insensible perspiration*. During a night of seven hours' sleep, we perspire about forty ounces, or two pounds and a half. At an average, we may estimate the discharge from the surface of the body, by sensible and insensible perspiration, at from half an ounce to four ounces an hour. This is a most wonderful part of the animal economy, and is absolutely necessary to our health, and even to our very existence. When *partially* obstructed, colds, rheumatisms, fevers, and other inflammatory disorders, are produced; and were it completely obstructed, the vital functions would be clogged and impeded in their movements, and death would inevitably ensue.

*Sensation*.—The nerves are generally considered as the instruments of sensation. They are soft white cords which proceed from the brain and spinal marrow. They come forth originally by pairs. Ten pair proceed from the medullary substance of the brain, which are distributed to all parts of the head and neck. Thirty pair proceed from the spinal marrow, through the vertebrae, to all the other parts of the body; being forty in all. These nerves, the ramifications of which are infinitely various and minute, are distributed upon the heart, lungs, blood-vessels, bowels, and muscles, till they terminate on the skin or external covering of the body. Impressions of external objects are received by the brain from the adjacent organs of sense, and the brain exercises its commands over the muscles and limbs by means of the nerves.

Without prosecuting these imperfect descriptions farther, I shall conclude this very hasty sketch with the following summary of the parts of the body, in the words of Bonnet. "The bones, by their joints and solidity, form the foundation of this fine machine: the ligaments are strings which unite the parts together: the muscles are fleshy substances, which act as elastic springs to put them in motion: the nerves, which are dispersed over the whole body, connect all the parts together: the arteries and veins, like rivulets, convey life and health throughout: the heart, placed in the centre, is the focus where the blood collects, or the acting power by means of which it circulates and is preserved: the lungs, by means of another power, draw in the external air, and expel hurtful vapours: the stomach and intestines are the magazines where every thing that is required for the daily supply is prepared: the brain, that seat of the soul, is formed in a manner suitable to the dignity of its inhabitant: the senses, which are the soul's ministers, warn it of all that is necessary either for its pleasure or use.\* Adorable Creator! with what wonderful art hast thou formed us!

Though the heavens did not exist to proclaim thy glory; though there were no created being on earth but myself, my own body might suffice to convince me that thou art a God of unlimited power and infinite goodness."

This subject suggests a variety of moral and religious reflections, but the limits to which I am confined will permit me to state only the following:—

1. The economy of the human frame, when seriously contemplated, has a tendency to excite admiration and astonishment, and to *impress us with a sense of our continual dependence on a superior power*. What an immense multiplicity of machinery must be in action to enable us to breathe, to feel, and to walk! Hundreds of bones, of diversified forms, connected together by various modes of articulation: hundreds of muscles to produce motion, each of them acting in at least ten different capacities, (see p. 40;) hundreds of tendons and ligaments to connect the bones and muscles; hundreds of arteries to convey the blood to the remotest part of the system; hundreds of veins to bring it back to its reservoir the heart; thousands of glands secreting humours of various kinds from the blood; thousands of lacteal and lymphatic tubes, absorbing and conveying nutriment to the circulating fluid; millions of pores, through which the perspiration is continually issuing; an infinity of ramifications of nerves, diffusing sensation throughout all the parts of this exquisite machine; and the heart at every pulsation exerting a force of a hundred thousand pounds, in order to preserve all this complicated machinery in constant operation! The whole of this vast system of mechanism must be in action before we can walk across our apartments! We admire the operation of a steam-engine, and the force it exerts. But, though it is constructed of the hardest materials which the mines can supply, in a few months some of its essential parts are worn and deranged, even though its action should be frequently discontinued. But the animal machine, though constructed, for the most part, of the softest and most flabby substances, can go on without intermission in all its diversified movements, by night and by day, for the space of eighty or a hundred years; the heart giving ninety-six thousand strokes every twenty-four hours, and the whole mass of blood rushing through a thousand pipes of all sizes every four minutes! And is it *man* that governs these nice and complicated movements? Did *he* set the heart in motion, or endue it with the muscular force it exerts? And when it has ceased to beat, can *he* command it again to resume its functions? Man knows neither the secret springs of the machinery within him, nor the half of the purposes for which they serve, or of the movements they perform. Can any thing more strikingly demonstrate our dependence

\* Contemplation of Nature, vol. I. p. 64.

every moment on a superior Agent, and that it is "in God we live, and move, and have our being? Were a single pin of the machinery within us, and over which we have no control, either broken or deranged, a thousand movements might instantly be interrupted, and our bodies left to crumble into the dust.

It was considerations of this kind that led the celebrated physician Galen, who was a skeptic in his youth, publicly to acknowledge that a Supreme Intelligence must have operated in ordaining the laws by which living beings are constructed. And he wrote his excellent treatise "On the uses of the parts of the human frame," as a solemn hymn to the Creator of the world. "I first endeavour from His works," he says, "to know him myself, and afterwards, by the same means, to show him to others; to inform them, how great is his wisdom, his goodness, his power." The late Dr. Hunter has observed, that astronomy and anatomy are the studies which present us with the most striking view of the two most wonderful attributes of the Supreme Being. The first of these fills the mind with the idea of his immensity, in the largeness, distances, and number of the heavenly bodies; the last astonishes us with his intelligence and art, in the variety and delicacy of animal mechanism.

2. The study of the animal economy has a powerful tendency to excite emotions of gratitude. Man is naturally a thoughtless and ungrateful creature. These dispositions are partly owing to ignorance of the wonders of the human frame, and of the admirable economy of the visible world; and this ignorance is owing to the want of those specific instructions which ought to be communicated by parents and teachers, in connexion with religion. For, there is no rational being who is acquainted with the structure of his animal system, and reflects upon it with the least degree of attention, but must feel a sentiment of admiration and gratitude. The science which unfolds to us the economy of our bodies, shows us on what an infinity of springs and motions, and adaptations, our life and comfort depend. And when we consider, that all these movements are performed without the least care or laborious effort on our part, if we be not altogether brutish, and insensible of our dependence on a superior Power, we must be filled with emotions of gratitude towards Him "whose hands have made and fashioned us, and who giveth us life, and breath, and all things." Some of the motions to which I have adverted depend upon our will; and with what celerity do they obey its commands? Before we can rise from our chair, and walk across our apartment, a hundred muscles must be set in motion; every one of these must be relaxed or constricted, just to a certain degree, and no more; and all must act harmoniously at the same instant of time; and, at the command of the soul, all these movements

are instantaneously performed. When I wish to lift my hand to my head, every part of the body requisite to produce the effect is put in motion: the nerves are braced, the muscles are stretched or relaxed, the bones play in their sockets, and the whole animal machine concurs in the action, as if every nerve and muscle had heard a sovereign and resistless call. When I wish the next moment to extend my hand to my foot, all these muscles are thrown into a different state, and a new set are brought along with them into action: and thus we may vary, every moment, the movements of the muscular system, and the mechanical actions it produces, by a simple change in our volition. Were we not daily accustomed to such varied and voluntary movements, or could we contemplate them in any other machine, we should be lost in wonder and astonishment.

Besides these voluntary motions, there are a thousand important functions which have no dependence upon our will. Whether we think of it or not, whether we are sleeping or waking, sitting or walking—the heart is incessantly exerting its muscular power at the centre of the system, and sending off streams of blood through hundreds of pipes; the lungs are continually expanding and contracting their thousand vesicles, and imbibing the vital principle of the air; the stomach is grinding the food; the lacteals and lymphatics are extracting nourishment for the blood; the liver and kidneys drawing off their secretions; and the perspiration issuing from millions of pores. These, and many other important functions with which we are unacquainted, and over which we have no control, ought to be regarded as the immediate agency of the Deity within us, and should excite our incessant admiration and praise.

There is one peculiarity in the constitution of our animal system, which we are apt to overlook, and for which we are never sufficiently grateful, and that is, *the power it possesses of self-restoration*. A wound heals up of itself; a broken bone is made firm again by a callus; and a dead part is separated and thrown off. If all the wounds we have ever received were still open and bleeding afresh, to what a miserable condition should we be reduced? But by a system of internal powers, beyond all human comprehension as to the mode of their operation, such dismal effects are effectually prevented. In short, when we consider that health depends upon such a numerous assemblage of moving organs, and that a single spring out of action might derange the whole machine, and put a stop to all its complicated movements, can we refrain from joining with the psalmist, in his pious exclamation, and grateful resolution, "How precious are thy wonderful contrivances concerning me, O God! how great is the sum of them! I will praise thee, for I am fearfully and wonderfully made. Mar-

revelous are thy works, and that my soul knoweth right well."

Omitting the consideration of several other departments of science, I shall in the mean time notice only another subject connected with religion, and that is History.

## HISTORY.

History embraces a record and description of past facts and events, in reference to all the nations and ages of the world, in so far as they are known, and have been transmitted to our times. As natural history contains a record of the operations of the Creator in the material world, so sacred and civil history embraces a record of his transactions in the moral and intellectual world, or, in other words, a detail of the plans and operations of his providence, in relation to the inhabitants of our globe. Through the medium of Sacred History, we learn the period and the manner of man's creation—the reason of his fall from the primitive state of integrity in which he was created, and the dismal consequences which ensued; the various movements of Providence in order to his recovery, and the means by which human redemption was achieved; the manner in which the gospel was at first promulgated, the countries into which it was carried, and the important effects it produced. Through the medium of Civil History we learn the deep and universal depravity of mankind, as exhibited in the wars, dissensions, and ravages, which have desolated our fallen race, in every period, and in every land; we learn the desperate wickedness of the human heart, in the more private acts of ferocity, cruelty, and injustice, which, in all ages, men have perpetrated upon each other; we behold the righteousness of the Supreme Ruler of the world, and the equity of his administration, in the judgments which have been inflicted on wicked nations—and the improbability, nay, the impossibility, of men being ever restored to moral order and happiness, without a more extensive diffusion of the blessings of the gospel of peace, and a more cordial acquiescence in the requirements of the divine laws.

Such being some of the benefits to be derived from history, it requires no additional arguments to show, that this branch of knowledge should occasionally form a subject of study to every intelligent Christian. But in order to render the study of history subservient to the interests of religion, it is not enough merely to gratify our curiosity and imagination, by following out a succession of memorable events, by tracing the progress of armies and of battles, and listening to the groans of the vanquished, and the shouts of conquerors. This would be to study history merely as skeptics, as atheists, or as writers of novels. When we contemplate the facts which the historian presents to our view, we ought to

raise our eyes to Him who is the Governor among the nations, "who doth according to his will in the armies of heaven, and among the inhabitants of the earth," and who overrules the jarring interests of mortals, for promoting the prosperity of that kingdom which shall never be moved. We should view the immoral propensities and dispositions of mankind as portrayed in the page of history, as evidences of the depravity of our species, and as excitements to propagate, with unremitting energy, the knowledge of that religion, whose sublime doctrines and pure precepts alone can counteract the stream of human corruption, and unite all nations in one harmonious society. We should view the contests of nations, and the results with which they are accompanied, as guided by that invisible Hand, which "mustereth the armies to the battle;" and should contemplate them either as the accomplishment of divine predictions, as the inflictions of retributive justice, as paving the way for the introduction of rational liberty and social happiness among men, or as ushering in that glorious period, when "the knowledge of the Lord shall cover the earth," and the nations shall learn war no more.

Thus I have taken a very cursory survey of some of those sciences which stand in a near relation to the objects of religion; and which may, indeed, be considered as forming so many of its subordinate branches. There are many other departments of knowledge, which, at first view, do not seem to have any relation to theological science; and yet, on a closer inspection, will be found to be essentially connected with the several subjects of which I have been treating. For example—some may be apt to imagine that arithmetic, geometry, trigonometry, and other branches of mathematics, can have no relation to the leading objects of religion. But if these sciences had never been cultivated, the most important discoveries of astronomy, geography, natural philosophy, and chymistry, would never have been made; ships could not have been navigated across the ocean; distant continents, and the numerous "isles of the sea," would have remained unexplored, and their inhabitants left to grope in the darkness of heathenism; and most of those instruments and engines by which the condition of the human race will be gradually meliorated, and the influence of Christianity extended, would never have been invented. Such is the dependence of every branch of useful knowledge upon another, that were any one portion of science, which has a practical tendency, to be discarded, it would prevent, to a certain degree, the improvement of every other. And, consequently, if any one science can be shown to have a connexion with religion, all the rest must likewise stand in a certain relation to it. It must, therefore, have a pernicious effect on the

minds of the mass of the Christian world, when preachers, in their sermons, endeavour to undervalue scientific knowledge, by attempting to contrast it with the doctrines of revelation. It would be just as reasonable to attempt to contrast the several doctrines, duties, and facts recorded in the New Testament with each other, in order to determine their relative importance, and to show which of them might be altogether overlooked and discarded. The series of facts and of divine revelations comprised in the bible; the moral and political events which diversify the history of nations; and the physical operations that are going on among the rolling worlds on high, and in the chymical changes of the invisible atoms of matter, are all parts of *one* comprehensive system, under the direction of the Eternal Mind; every portion of which must have a certain relation to the whole.

And, therefore, instead of attempting to degrade one part of the divine fabric in order to enhance another, our duty is to take an expansive view of the whole, and to consider the symmetry and proportion of its parts, and their mutual bearings and relations—in so far as our opportunities, and the limited faculties of our minds, will permit.

If the remarks which have been thrown out in this chapter, respecting the connexion of the sciences with religion, have any foundation, it will follow—that sermons, lectures, systems of divinity, and religious periodical works, should embrace occasional illustrations of such subjects, for the purpose of expanding the conceptions of professed Christians, and of enabling them to take large and comprehensive views of the per-

fections of the providence of the Almighty. It is much to be regretted, that so many members of the Christian church are absolute strangers to such studies and contemplations; while the time and attention that might have been devoted to such exercises, have, in many cases, been usurped by the most grovelling affections, by foolish pursuits, by gossiping chit-chat, and slanderous conversation. Shall the most trifling and absurd opinions of ancient and modern heretics be judged worthy of attention, and occupy a place in religious journals, and even in discussions from the pulpit, and shall “the mighty acts of the Lord,” and the visible wonders of his power and wisdom, be thrown completely into the shade? To survey, with an eye of intelligence, the wide-extended theatre of the divine operations—to mark the agency of the Eternal Mind in every object we behold, and in every movement within us and around us, are some of the noblest attainments of the rational soul; and, in conjunction with every other Christian study and acquirement, are calculated to make “the man of God perfect, and thoroughly furnished unto every good work.” By such studies, we are, in some measure, assimilated to the angelic tribes, whose powers of intellect are for ever employed in such investigations—and are gradually prepared for bearing a part in their immortal hymn—“Great and marvellous are thy works, Lord God Almighty; just and true are thy ways, thou King of saints. Thou art worthy to receive glory, and honour, and power; for thou hast created all things, and for thy pleasure they are and were created.”

## CHAPTER III.

### THE RELATION WHICH THE INVENTIONS OF HUMAN ART BEAR TO THE OBJECTS OF RELIGION.

In this chapter, I shall briefly notice a few philosophical and mechanical inventions which have an obvious bearing on religion, and on the general propagation of Christianity among the nations.

The first, and perhaps the most important, of the inventions to which I allude, is the *Art of Printing*. This art appears to have been invented (at least in Europe) about the year 1450, by one Laurentius, or Lawrence Koster, a native of Haerlem, a town in Holland. As he was walking in a wood near the city, he began to cut some letters upon the rind of a beech tree, which, for the sake of gratifying his fancy, being impressed on paper, he printed one or two lines as a specimen for his grandchildren to follow. This

having succeeded, he meditated greater things, and, first of all, invented a more glutinous writing ink; because he found the common ink sunk and spread; and thus formed whole pages of wood, with letters cut upon them.\* By the gradual

\* I am aware, that the honour of this invention has been claimed by other cities besides Haerlem, particularly by Strasburg, and Mentz, a city of Germany; and by other individuals besides Laurentius, chiefly by one *Fust*, commonly called Dr. Faustus; by Schoeffer, and by Gutenberg. It appears that the art, with many of its implements, was stolen from Laurentius by one of his servants, whom he had bound, by an oath, to secrecy, who fled to Mentz, and first commenced the process of printing in that city. Here the art was improved by Fust and Schoeffer, by their invention of *metallic*, instead of *wooden* types, which were first used. When Fust was in Paris, disposing of some bibles he had printed, at

improvement of this art, and its application to the diffusion of knowledge, a new era was formed in the annals of the human race, and in the progress of science, religion, and morals. To it we are chiefly indebted for our deliverance from ignorance and error, and for most of those scientific discoveries and improvements in the arts which distinguish the period in which we live. Without its aid, the Reformation from Popery could scarcely have been achieved; for, had the books of Luther, one of the first reformers, been multiplied by the slow process of handwriting and copying, they could never have been diffused to any extent; and the influence of bribery and of power might have been sufficient to have arrested their progress, or even to have erased their existence. But, being poured forth from the press in thousands at a time, they spread over the nations of Europe like an inundation, and with a rapidity which neither the authority of princes, nor the schemes of priests and cardinals, nor the bulls of popes, could counteract or suspend. To this noble invention it is owing that copies of the bible have been multiplied to the extent of many millions—that ten thousands of them are to be found in every Protestant country—and that the

the low price (as was then thought) of sixty crowns, the number and the uniformity of the copies he possessed created universal agitation and astonishment. Informations were given to the police against him as a magician, his lodgings were searched, and a great number of copies being found, they were seized; the red ink with which they were embellished was said to be his blood; it was seriously adjudged, that he was in league with the devil; and if he had not fled from the city, most probably he would have shared the fate of those whom ignorant and superstitious judges, at that time, condemned for witchcraft. From this circumstance, let us learn to beware how we view the inventions of genius, and how we treat those whose ingenious contrivances may afterwards be the means of enlightening and meliorating mankind. See *Appendix*, No. VII.

Various improvements have been made, of late years, in the art of printing. That which has lately been announced by Dr. Church of Boston, is the most remarkable; and, if found successful, will carry this art to a high degree of perfection. A principal object of this improvement is, to print constantly from new types, which is effected by simplifying the process for casting and composing. The type is delivered perfect by machinery, and laid as it is cast, in separate compartments, with unerring order and exactness. The composition is then effected by other apparatus, directed by keys like those of a piano-forte, and the type may then be arranged in words and lines, as quickly as in the performance of notes in music. No error can arise except from touching the wrong key; and hence an expert hand will leave little labour for the reader. It is then found less expensive under Dr. Church's economical system of re-casting, to re-melt the types, and re-cast them, than to perform the tedious operation of distribution. The melting takes place without atmospheric exposure, by which oxydation and waste of metal are avoided. It is calculated that two men can produce 75,000 new types per hour, and in re-composing, one man will perform as much as three or four compositors. In the production of types, the saving is ninety-nine parts in a hundred; and in the composition, distribution, and reading, is three parts in four. In regard to press-work, Dr. C. has invented a machine to work with platens, instead of cylinders, from which he will be enabled to take 80 fine impressions per minute.

poorest individual who expresses a desire for it, may be furnished with the "word of life" which will guide him to a blessed immortality. That divine light which is destined to illuminate every region of the globe, and to sanctify and reform men of all nations, and kindreds, and tongues, is accelerated in its movements, and directed in its course through the nations, by the invention of the art of printing; and ere long it will distribute among the inhabitants of every land, the "law and the testimony of the Most High," to guide their steps to the regions of eternal bliss. In short, there is not a more powerful engine in the hands of Providence, for diffusing the knowledge of the nature and the will of the Deity, and for accomplishing the grand objects of revelation, than the art of multiplying books, and of conveying intelligence through the medium of the press. Were no such art in existence, we cannot conceive how an extensive and universal propagation of the doctrines of revelation could be effected, unless after the lapse of an indefinite number of ages. But, with the assistance of this invention, in its present improved state, the island of Great Britain alone, within less than a hundred years, could furnish a copy of the Scriptures to every inhabitant of the world, and would defray the expense of such an undertaking, with much more ease, and with a smaller sum, than were necessary to furnish the political warfare in which we were lately engaged.

These considerations teach us, that the ingenious inventions of the human mind are under the direction and control of the Governor of the world—are intimately connected with the accomplishment of the plan of his providence, and have a tendency, either directly or indirectly, to promote, over every region of the earth, the progress and extension of the kingdom of the Redeemer. They also show us, from what small beginnings the most magnificent operations of the divine economy may derive their origin. Who could have imagined that the simple circumstance of a person amusing himself by cutting a few letters on the bark of a tree, and impressing them on paper, was intimately connected with the mental illumination of mankind; and that the art which sprung from this casual process was destined to be the principal means of illuminating the nations, and of conveying to the ends of the earth, "the salvation of our God?" But, "He who rules in the armies of heaven, and among the inhabitants of the earth," and who sees "the end from the beginning," overrules the most minute movement of all his creatures, in subserviency to his ultimate designs, and shows himself, in this respect, to be "wonderful in counsel, and excellent in working."

*The Mariner's Compass.*—Another invention which has an intimate relation to religion, is, *the art of Navigation, and the invention of the Mariner's Compass.* Navigation is the art of

conducting a ship through the sea, from one port to another. This art was partly known and practised in the early ages of antiquity, by the Phenicians, the Carthaginians, the Egyptians, the Romans, and other nations of Europe and Asia. But they had no guide to direct them in their voyages, except the sun in the day-time, and the stars by night. When the sky was overcast with clouds, they were thrown into alarms, and durst not venture to any great distance from the coast, lest they should be carried forward in a course opposite to that which they intended, or be driven against hidden rocks, or unknown shores. The danger and difficulty of the navigation of the ancients, on this account, may be learned from the deliberations, the great preparations, and the alarms of Homer's heroes, when they were about to cross the Egean sea, an extent of not more than 150 miles; and the expedition of the Argonauts under Jason, across the sea of Marmora and the Euxine, to the island of Colchis, a distance of only four or five hundred miles, was viewed as a most wonderful exploit, at which even the gods themselves were said to be amazed. The same thing appears from the narration we have in the Acts of the Apostles, of Paul's voyage from Cesarea to Rome.—“When,” says Luke, “neither sun nor stars in many days appeared, and no small tempests lay on us, all hope that we should be saved was then taken away.” Being deprived of these guides, they were tossed about in the Mediterranean, not knowing whether they were carried to the north, south, east, or west. So that the voyages of antiquity consisted chiefly in creeping along the coast, and seldom venturing beyond sight of land: they could not, therefore, extend their excursions by sea to distant continents and nations; and hence, the greater portion of the terraqueous globe and its inhabitants were to them altogether unknown. It was not before the invention of the mariner's compass, that distant voyages could be undertaken, that extensive oceans could be traversed, and an intercourse carried on between remote continents and the islands of the ocean.

It is somewhat uncertain at what precise period this noble discovery was made; but it appears pretty evident, that the mariner's compass was not commonly used in navigation before the year 1420, or only a few years before the invention of printing.\* The loadstone, in all ages, was known to have the property of attracting iron; but its tendency to point towards the north and south seems to have been unnoticed till the beginning of the twelfth century. About that

time some curious persons seem to have amused themselves by making to swim, in a basin of water, a loadstone suspended on a piece of cork; and to have remarked, that, when left at liberty, one of its extremities pointed to the north. They had also remarked, that, when a piece of iron is rubbed against the loadstone, it acquires also the property of turning towards the north, and of attracting needles and filings of iron. From one experiment to another, they proceeded to lay a needle, touched with the magnet, on two small bits of straw floating on the water and to observe that the needle invariably turned its point towards the north. The first use they seem to have made of these experiments, was, to impose upon simple people by the appearance of magic. For example, a hollow swan, or the figure of a mermaid, was made to swim in a basin of water, and to follow a knife with a bit of bread upon its point, which had been previously rubbed on the loadstone. The experimenter convinced them of his power, by commanding, in this way, a needle laid on the surface of the water to turn its point from the north to the east, or in any other direction. But some geniuses, of more sublime and reflective powers of mind, seizing upon these hints, at last applied these experiments to the wants of navigation, and constructed an instrument, by the help of which the mariner can now direct his course to distant lands, through the vast and pathless ocean.

In consequence of the discovery of this instrument, the coasts of almost every land on the surface of the globe have been explored, and a regular intercourse opened up between the remotest regions of the earth. Without the help of this noble invention, America, in all probability, would never have been discovered by the eastern nations—the vast continent of New-Holland—the numerous and interesting islands in the Indian and Pacific oceans—the inles of Japan, and other immense territories inhabited by human beings, would have remained as much unknown and unexplored as if they had never existed. And as the nations of Europe and the western parts of Asia were the sole depositories of the records of revelation, they could never have conveyed the blessings of salvation to remote countries and to unknown tribes of mankind, of whose existence they were entirely ignorant. Even although the whole terraqueous globe had been sketched out before them, in all its aspects and bearings, and ramifications of islands, continents, seas, and oceans, and the moral and political state of every tribe of its inhabitants

\* The invention of the compass is usually ascribed to Flavio Gioia, of Amalfi, in Campania, about the year 1302; and the Italians are strenuous in supporting this claim. Others affirm, that Marcus Paulus, a Venetian, having made a journey to China, brought back the invention with him in 1260. The French also lay claim to the honour of this invention, from the circumstance, that all nations distinguish the

north point of the card by a *flour-de-lis*, and, with equal reason, the English have laid claim to the same honour, from the name *compass*, by which most nations have agreed to distinguish it. But whoever were the inventors, or at whatever period this instrument was first constructed, it does not appear that it was brought into general use before the period mentioned in the text.

displayed to view without a guide to direct their course through the billows of the ocean, they could have afforded no light and no relief to cheer the distant nations "who sit in darkness, and in the shadow of death." Though the art of printing had been invented; though millions of bibles were now prepared, adequate to the supply of all the "kindreds of the heathen;" though ships in abundance were equipped for the enterprise, and thousands of missionaries ready to embark, and to devote their lives to the instruction of the pagan world—all would be of no avail, and the "salvation of God" could never be proclaimed to the ends of the world, unless they had a mariner's compass to guide their course through the trackless ocean.

In this invention, then, we behold a proof of the agency of Divine Providence, in directing the efforts of human genius to subserve the most important designs, and contemplate a striking specimen of the "manifold wisdom of God." When the pious and contemplative Israelite reflected on the declaration of the prophets, that "the glory of Jehovah would be revealed, and that all flesh would see it together;"—from the state of the arts which then existed, he must have felt many difficulties in forming a conception of the manner in which such predictions could be realized. "The great and wide sea," now termed the Mediterranean, formed the boundary of his view, beyond which he was unable to penetrate. Of the continents, and "the isles afar off," and of the far more spacious oceans that lay between, he had no knowledge; and how "the ends of the earth" were to be reached, he could form no conception; and, in the midst of his perplexing thoughts, he could find no satisfaction but in the firm belief, that "with God all things are possible." But now we are enabled not only to contemplate the grand designs of the divine economy, but the principal means by which they shall all, in due time, be accomplished, in consequence of the progress of science and art, and of their consecration to the rearing and extension of the Christian church.

The two inventions to which I have now adverted, may perhaps be considered as among the most striking instances of the connexion of human art with the objects of religion. But there are many other inventions, which, at first view, do not appear to bear so near a relation to the progress of Christianity, and yet have an ultimate reference to some of its grand and interesting objects.

*The Telescope.*—We might be apt to think, on a slight view of the matter, that there can be no immediate relation between the grinding and polishing of an optic glass, and fitting two or more of them in a tube, and the enlargement of our views of the operation of the Eternal Mind. Yet the connexion between these two objects, and the dependence of the latter upon

the former, can be fairly demonstrated. The son of a spectacle-maker of Middleburg in Holland, happening to amuse himself in his father's shop, by holding two glasses between his finger and his thumb, and varying their distance, perceived the weathercock of the church spire opposite to him much larger than ordinary, and apparently much nearer, and turned upside down. This new wonder excited the amazement of the father; he adjusted two glasses on a board, rendering them moveable at pleasure; and thus formed the first rude imitation of a perspective glass, by which distant objects are brought near to view. Galileo, a philosopher of Tuscany, hearing of the invention, set his mind to work, in order to bring it to perfection. He fixed his glasses at the end of long organ-pipes, and constructed a telescope, which he soon directed to different parts of the surrounding heavens. He discovered four moons revolving around the planet Jupiter—spots on the surface of the sun, and the rotation of that globe around its axis—mountains and valleys in the moon—and numbers of fixed stars where scarcely one was visible to the naked eye. These discoveries were made about the year 1610, a short time after the first invention of the telescope. Since that period this instrument has passed through various degrees of improvement, and, by means of it, celestial wonders have been explored in the distant spaces of the universe, which, in former times, were altogether concealed from mortal view. By the help of telescopes, combined with the art of measuring the distances and magnitudes of the heavenly bodies, our views of the grandeur of the Almighty, of the plenitude of his power, and of the extent of his universal empire, are extended far beyond what could have been conceived in former ages. Our prospects of the range of the divine operations are no longer confined within the limits of the world we inhabit; we can now plainly perceive, that the kingdom of God is not only "an everlasting dominion," but that it extends through the unlimited regions of space, comprehending within its vast circumference thousands of suns, and tens of thousands of worlds, all ranged in majestic order, at immense distances from one another, and all supported and governed "by Him who rides on the Heaven of heavens," whose greatness is unsearchable, and whose understanding is infinite.

The telescope has also demonstrated to us the *literal truth* of those scriptural declarations which assert that the stars are "innumerable." Before the invention of this instrument, not more than about two thousand stars could be perceived by the unassisted eye in the clearest night. But this invention has unfolded to view not only thousands, but hundreds of thousands, and millions, of those bright luminaries, which lie dispersed in every direction throughout the boundless dimensions of space. And the higher

the magnifying powers of the telescope are, the more numerous those celestial orbs appear; leaving us no room to doubt, that countless myriads more lie hid in the distant regions of creation, far beyond the reach of the finest glasses that can be constructed by human skill, and which are known only to Him "who counts the number of the stars, and calls them by their names."

In short, the telescope may be considered as serving the purpose of a vehicle for conveying us to the distant regions of space. We would consider it as a wonderful achievement, could we transport ourselves two hundred thousand miles from the earth, in the direction of the moon, in order to take a nearer view of that celestial orb. But this instrument enables us to take a much nearer inspection of that planet, than if we had actually surmounted the force of gravitation, traversed the voids of space, and left the earth 230,000 miles behind us. For, supposing such a journey to be accomplished, we should still be ten thousand miles distant from that orb. But a telescope which magnifies objects 240 times, can carry our views within one thousand miles of the moon; and a telescope, such as Dr. Herschel's 40 feet reflector, which magnifies 6000 times, would enable us to view the mountains and vales of the moon, as if we were transported to a point about 40 miles from her surface.\* We can view the magnificent system of the planet Saturn, by means of this instrument, as distinctly, as if we had performed a journey eight hundred millions of miles in the direction of that globe, which at the rate of 50 miles an hour, would require a period of more than eighteen hundred years to accomplish. By the telescope, we can contemplate the region of the fixed stars, their arrangement into systems, and their immense numbers, with the same distinctness and amplitude of view, as if

\* Though the highest magnifying power of Dr. Herschel's large telescope was estimated at six thousand times, yet it does not appear that the doctor ever applied this power with success, when viewing the moon and the planets. The deficiency of light, when using so high a power, would render the view of these objects less satisfactory than when viewed with a power of one or two thousand times. Still, it is quite certain, that if any portions of the moon's surface were viewed through an instrument of such a power, they would appear as large (but not nearly so bright and distinct) as if we were placed about 40 miles distant from that body. The enlargement of the angle of vision, in this case, or, the apparent distance at which the moon would be contemplated, is found by dividing the moon's distance—240,000 miles by 6000, the magnifying power of the telescope, which produces a quotient of 40—the number of miles at which the moon would appear to be placed from the eye of the observer. Dr. Herschel appears to have used the highest power of his telescopes, only, or chiefly, when viewing some very minute objects in the region of the stars. The powers he generally used, and with which he made most of his discoveries were, 227, 460, 754, 932, and occasionally 2010, 3168, and 6450, when inspecting double and triple stars, and the more distant nebulae.

we had actually taken a flight of ten hundred thousand millions of miles into those unexplored and unexplorable regions, which could not be accomplished in several millions of years, though our motion were as rapid as a ball projected from a loaded cannon. We would justly consider it as a noble endowment for enabling us to take an extensive survey of the works of God, if we had the faculty of transporting ourselves to such immense distances from the sphere we now occupy but, by means of the telescopic tube, we may take nearly the same ample views of the dominions of the Creator, without stirring a foot from the limits of our terrestrial abode. This instrument may, therefore, be considered as a providential gift, bestowed upon mankind, to serve, in the mean time, as a *temporary substitute* for those powers of rapid flight with which the seraphim are endowed, and for those superior faculties of motion with which man himself may be invested, when he arrives at the summit of moral perfection.\*

*The Microscope.*—The microscope is another instrument constructed on similar principles, which has greatly expanded our views of the "manifold wisdom of God." This instrument, which discovers to us small objects, invisible to the naked eye, was invented soon after the invention and improvement of the telescope. By means of this optical contrivance, we perceive a variety of wonders in almost every object in the animal, the vegetable, and the mineral kingdoms. We perceive that every particle of matter, however minute, has a determinate form—that the very scales of the skin of a haddock are all beautifully interwoven and variegated, like pieces of net-work, which no art can imitate—that the points of the prickles of vegetables, though magnified a thousand times, appear as sharp and well polished as to the naked eye—that every particle of the dust on the butterfly's wing is a beautiful and regularly organized feather—that every hair of our head is a hollow tube, with bulbs and roots, furnished with a variety of threads or filaments—and that the pores in our skin, through which the sweat and perspiration flow, are so numerous and minute, that a grain of sand would cover a hundred and twenty-five thousand of them. We perceive animated beings in certain liquids, so small, that fifty thousand of them would not equal the size of a mite; and yet each of these creatures is furnished with a mouth, eyes, stomach, blood-vessels, and other organs for the performance of animal functions. In a stagnant pool which is covered with a greenish scum during the summer months, every drop of the water is found to be a world teeming with thousands of inhabitants. The mouldy substance which usually adheres to damp bodies exhibits a forest of trees and plants, where the branches, leaves, and fruit, can be plainly dis-

\* See Appendix, No VIII.

tinguished. In a word, by this admirable instrument we behold the same Almighty Hand which rounded the spacious globe on which we live, and the huge masses of the planetary orbs, and directs them in their rapid motions through the sky,—employed, at the same moment, in rounding and polishing ten thousand minute transparent globes in the eye of a fly; and boring and arranging veins and arteries, and forming and clasping joints and claws, for the movements of a mite! We thus learn the admirable and astonishing effects of the wisdom of God, and that the divine care and benevolence are as much displayed in the construction of the smallest insect, as in the elephant or the whale, or in those ponderous globes which roll around us in the sky. These, and thousands of other views which the microscope exhibits, would never have been displayed to the human mind, had they not been opened up by this admirable invention.

In fine, by means of the two instruments to which I have now adverted, we behold Jehovah's empire extending to infinity on either hand. By the telescope we are presented with the most astonishing displays of his *omnipotence*, in the immense number, the rapid motions, and the inconceivable magnitudes of the celestial globes; and, by the microscope, we behold, what is still more inconceivable, a display of his unsearchable wisdom in the divine mechanism by which a drop of water is peopled with myriads of inhabitants—a fact which, were it not subject to ocular demonstration, would far exceed the limits of human conception or belief. We have thus the most striking and sensible evidence, that, from the immeasurable luminaries of heaven, and from the loftiest seraph that stands before the throne of God, down to this lower world, and to the smallest microscopic animalcula that eludes the finest glass, *He* is every where present, and, by his power, intelligence, and agency, animates, supports, and directs the whole. Such views and contemplations naturally lead us to advert to the character of God as delineated by the sacred writers, that "He is of great power, and mighty in strength;" that "His understanding is infinite;" that "His works are wonderful;" that "His operations are unsearchable and past finding out;" and they must excite the devout mind to join with fervour in the language of adoration and praise.

When thy amazing works, O God!  
My mental eye surveys,  
"Transported with the view, I'm lost  
In wonder, love, and praise."

*Steam Navigation.*—We might have been apt to suppose that the chymical experiments that were first made to demonstrate the force of steam as a mechanical agent, could have little relation to the objects of religion, or even to the comfort of human life and society. Yet it has

now been applied to the impelling of ships and large boats along rivers and seas, in opposition to both wind and tide, and with a velocity which, at an average, exceeds that of any other conveyance. We have no reason to believe that this invention has hitherto approximated to a state of perfection; it is yet in its infancy, and may be susceptible of such improvements, both in point of expedition and of safety, as may render it the most comfortable and speedy conveyance between distant lands, for transporting the volume of inspiration and the heralds of the gospel of peace to "the ends of the earth." By the help of his compass the mariner is enabled to steer his course in the midst of the ocean, in the most cloudy days, and in the darkest nights, and to transport his vessel from one end of the world to another. It now only remains, that navigation be rendered safe, uniform, and expeditious, and not dependent on adverse winds, or the currents of the ocean; and, perhaps the art of propelling vessels by the force of steam, when arrived at perfection, may effectuate those desirable purposes. Even at present, as the invention now stands, were a vessel to be fitted to encounter the waves of the Atlantic, constructed of a proper figure and curvature, having a proper disposition of her wheels, and having such a description of fuel, as could be easily stowed, and in sufficient quantity for the voyage—at the rate of ten miles an hour, she could pass from the shores of Britain to the coast of America, in less than thirteen days;—and, even at eight miles an hour, the voyage could be completed in little more than fifteen days; so that intelligence might pass and re-pass between the eastern and western continents within the space of a single month—a space of time very little more than was requisite, sixty years ago, for conveying intelligence between Glasgow and London. The greatest distance at which any two places on the globe lie from each other, is about 12,500 miles; and, therefore, if a direct portion of water intervene between them, this space could be traversed in fifty-four or sixty days. And, if the isthmus of Panama, which connects North and South America, and the isthmus of Suez, which separates the Mediterranean from the Red sea, were cut into wide and deep canals, (which we have no doubt will be accomplished as soon as civilized nations have access to perform operations in those territories,) every country in the world could then be reached from Europe, in nearly a direct line, or at most by a gentle curve, instead of the long, and dangerous, and circuitous route which must now be taken, in sailing for the eastern parts of Asia, and the north-western shores of America. By this means, eight or nine thousand miles of sailing would be saved in a voyage from England to Nootka sound, or the peninsula of California; and

more than six thousand miles, in passing from London to Bombay in the East Indies; and few places on the earth would be farther distant from each other by water than 15,000 miles; which space might be traversed, at the rate mentioned above, in a period of from sixty-two to seventy-seven days.\*

But we have reason to believe, that when this invention, combined with other mechanical assistances, shall approximate nearer to perfection, a much more rapid rate of motion will be effected; and the advantages of this, in a religious as well as in a commercial point of view, may be easily appreciated, especially at the present period, when the Christian world, now aroused from their slumbers, have formed the grand design of sending a bible to every inhabitant of the globe. When the empire of the prince of darkness shall be shaken throughout all its dependencies, and the nations aroused to inquire after light, and liberty, and divine knowledge—intelligence would thus be rapidly communicated over every region, and between the most distant tribes. “Many would run to and fro, and knowledge would be increased.” The ambassadors of the Redeemer, with the oracles of heaven in their hands, and the words of salvation in their mouths, would quickly be transported to every clime, “having the everlasting gospel to preach to every nation, and kindred, and tongue, and people.”

*Air Balloons.*—Similar remarks may be applied to the invention of *Air Balloons*. We have heard of some pious people who have mourned over such inventions, and lamented the folly of mankind in studying their construction, and witnessing their exhibition. Such dispositions generally proceed from a narrow range of thought, and a contracted view of the divine economy and arrangements in the work of redemption. Though the perversity of mankind has often applied useful inventions to foolish, and even to vicious purposes, yet this forms no reason why such inventions should be decried; otherwise the art of printing, and many other useful arts, might be regarded as inimical to the human race. We have reason to believe that air balloons may yet be brought to such perfection, as to be applied to purposes highly beneficial to the progress of the human mind, and subservient, in some degree, for effecting the purposes of providence in the enlightening and renovation of mankind. For this purpose, it is only requisite that some contrivance, on chymical or mechanical principles, be suggested, analogous to the sails or rudder of a ship, by which they may be moved in any direction, without being directed solely by the course of the wind; and, there can be little doubt that such a contrivance is possible to be effected. It requires only suitable encouragement to be given to ingenious

experimental philosophers, and a sufficient sum of money to enable them to prosecute their experiments on an extensive scale. To the want of such prerequisites, it is chiefly owing, that the hints on this subject, hitherto suggested, have either failed of success or have never been carried into execution. A more simple and expeditious process for filling balloons has lately been effected—the use of the *parachute*, by which a person may detach himself from the balloon, and descend to the earth, has been successfully tried,—the lightning of heaven has been drawn from the clouds, and forced to act as a mechanical power in splitting immense stones to pieces,—the atmosphere has been analyzed into its component parts, and the wonderful properties of the ingredients of which it is composed exhibited in their separate state: and why, then, should we consider it as at all improbable that the means of producing a horizontal direction in aerial navigation may soon be discovered? Were this object once effected, balloons might be applied to the purpose of surveying and exploring countries hitherto inaccessible, and of conveying the messengers of divine mercy to tribes of our fellow men, whose existence is as yet unknown.

We are certain that every portion of the inhabited world must be thoroughly explored, and its inhabitants visited, before the salvation of God can be carried fully into effect; and, for the purpose of such explorations, we must, of course, resort to the inventions of human genius in art and science. Numerous tribes of the sons of Adam are, doubtless, residing in regions of the earth with which we have no acquaintance, and to which we have no access by any of the modes of conveyance presently in use. More than one-half of the interior parts of Africa and Asia, and even of America, are wholly unknown to the inhabitants of the civilized world. The vast regions of Chinese Tartary, Thibet, Siberia, and the adjacent districts; almost the whole interior of Africa, and the continent of New Holland—the extensive isles of Borneo, Sumatra, New Guinea, and Japan, the territory of the Amazons, and the internal parts of North America, remain, for the most part, unknown and unexplored. The lofty and impassable ranges of mountains, and the deep and rapid rivers, which intervene between us and many of those regions, together with the savage and plundering hordes of men, and the tribes of ravenous beasts, through which the traveller must push his way, present to European adventurers barriers which they cannot expect to surmount by the ordinary modes of conveyance, for a lapse of ages. But by balloons constructed with an apparatus for directing their motions, all such obstructions would at once be surmounted. The most impenetrable regions, now hemmed in by streams and marshes, and lofty mountains, and a barbarous population, would be quickly laid open

\* See Appendix, No. IX.

and cities and nations, lakes and rivers, and fertile plains, to which we are now entire strangers, would soon burst upon the view. And the very circumstance, that the messengers of peace and salvation descended upon such unknown tribes from the regions of the clouds, might arouse their minds, and excite their attention and regard to the message of divine mercy which they came thither to proclaim.\* Such a scene (and it may probably be realized) would present a literal fulfilment of the prediction of "*angels flying through the midst of*" the aerial "*heaven*, having the everlasting gospel to preach to them that dwell upon the earth, and to every kindred and nation."

That the attention of the philosophical world is presently directed to this subject, and that we have some prospect of the views above suggested being soon realized, will appear from the following notice, which lately made its appearance in the London scientific journals:—"A prize being offered for the discovery of a horizontal direction in aerostation, M. Mingrelli of Bologna, M. Pietripoli of Venice, and M. Lember of Nuremberg, have each assumed the merit of resolving this problem. It does not appear that any one of these has come forward to establish, by practical experiment, the validity of his claim; but a pamphlet has lately been reprinted at Paris (first printed at Vienna) on this subject, addressed to all the learned societies in Europe. The following passage appears in the work:—"Professor Robertson proposes to construct an

\* In this point of view, we cannot but feel the most poignant regret at the conduct of the Spaniards, after the discovery of America, towards the natives of that country. When those untutored people beheld the ships which had conveyed Columbus and his associates from the eastern world, the dresses and martial order of his troops, and heard their music, and the thunder of their cannon, they were filled with astonishment and wonder at the strange objects presented to their view; they fell prostrate at their feet, and viewed them as a superior race of men. When Cortes afterwards entered the territories of Mexico, the same sentiments of reverence and admiration seemed to pervade its inhabitants. Had pure Christian motives actuated the minds of these adventurers, and had it been their ruling desire to communicate to those ignorant tribes the blessings of the gospel of peace, and to administer to their external comfort, the circumstances now stated would have been highly favourable to the success of missionary exertion, and would have led them to listen with attention to the message from heaven. But, unfortunately for the cause of religion, treachery, lust, cruelty, selfishness, and the cursed love of gold, predominated over every other feeling, affixed a stigma to the Christian name, and rendered them curses instead of blessings, to that newly-discovered race of men. It is most earnestly to be wished, that, in future expeditions in quest of unknown tribes, a few intelligent and philanthropic missionaries may be appointed to direct the adventurers in their moral conduct and intercourse with the people they visit, in order that nothing inconsistent with Christian principle make its appearance. The uniform manifestation of Christian benevolence, purity, and rectitude, by a superior race of men, would win the affections of a rude people far more effectually than all the pomp and ensigns of military parade.

aerostatic machine, 150 feet in diameter, to be capable of raising 72,954 kilograms, equivalent to 149,037 lbs. weight, (French,) to be capable of conveying all the necessaries for the support of sixty individuals, scientific characters, to be selected by the academicians, and the aerial navigations to last for some months, exploring different heights and climates, &c. in all seasons. If, from accident, or wear, the machine, elevated above the ocean, should fail in its functions, to be furnished with a ship that will ensure the return of the aeronauts."

Should any one be disposed to insinuate, that the views now stated on this subject are chimerical and fallacious, I beg leave to remind them, that, not more than twenty years ago, the idea of a large vessel, without oars and sails, to be navigated against the wind, with the rapidity of ten miles an hour, would have been considered as next to an impossibility, and a mere fanciful scheme, which could never be realized. Yet we now behold such vehicles transporting whole villages to the places of their destination, with a degree of ease, comfort, and expedition, formerly unknown. And little more than forty years have elapsed, since it would have been viewed as still more chimerical to have broached the idea, that a machine might be constructed, by which human beings might ascend more than two miles above the surface of the earth, and fly through the region of the clouds at the rate of seventy miles an hour, carrying along with them books, instruments, and provisions. Yet both these schemes have been fully realized, and, like many other inventions of the human intellect, are doubtless intended to subserve some important ends in the economy of divine providence.†

† Balloons were first constructed in the year 1783, by Messrs. B. and J. Mongolfier, paper manufacturers at Annonay, in France. A sheep, a cock, and a duck, were the first animals ever carried up into the air by these vehicles. At the end of their journey, they were found perfectly safe and unhurt, and the sheep was even feeding at perfect ease. The first human being who ascended into the atmosphere in one of these machines, was M. Pilatre de Rozier. This adventurer ascended from amidst an astonished multitude assembled in a garden in Paris, on the 15th October, 1783, in a balloon, whose diameter was 48 feet, and its height about 74; and remained suspended above the city about four hours. Mr. Lunardi, an Italian, soon after, astonished the people of England and Scotland, by his aerial excursions. Dr. G. Gregory gives the following account of his ascent:—"I was myself a spectator of the flight of Lunardi, and I never was present at a sight so interesting and sublime. The beauty of the gradual ascent, united with a sentiment of terror, on account of the danger of the man, and the novelty and grandeur of the whole appearance, are more than words can express. A delicate woman was so overcome with the spectacle, that she died upon the spot, as the balloon ascended; several fainted; and the silent admiration of the anxious multitude was beyond any thing I had ever beheld."

Balloons have been generally made of varnished silk, and of the shape of a globe or a spheroid, from thirty to fifty feet in diameter. They are filled with hydrogen gas, which, as formerly stated, is from twelve to fifteen times lighter than common air.

**Acoustic Tunnels.**—By means of the inventions just now adverted to, when brought to perfection, mankind may be enabled to transport themselves to every region of the globe, with a much greater degree of rapidity than has hitherto been attained. By the help of the microscope, we are enabled to contemplate the invisible worlds of life, and by the telescope we can penetrate into regions far beyond the range of the unassisted eye. By the arts of writing and printing, we can communicate our sentiments, after a certain lapse of time, to every quarter of the world. In the progress of human knowledge and improvement, it would obviously be of considerable importance, *could we extend the range of the human voice*, and communicate intelligence to the distance of a thousand miles, in the course of two or three hours; or could we hold an occasional conversation with a friend at the distance of 20 or 30 miles. From the experiments which have been lately made, in reference to the conveyance of sound, we have some reason to believe, that such objects may not be altogether unattainable. It has been long known, that wood is a good conductor of sound. If a watch be laid on the end of a long beam of timber, its beating will be distinctly heard, on applying the ear to the other end, though it could not be heard at the same distance through the air. In "Nicholson's Philosophical Journal" for February, 1803, Mr. E. Walker describes a simple apparatus, connected with a speaking trumpet, by means of which, at the distance of  $17\frac{1}{2}$  feet, he held a conversation with another in whispers, too low to be heard through the air at that distance. When the ear was placed in a certain position, the words were heard as if they had been spoken by an invisible being within the trumpet. And what rendered the deception still more pleasing, the words were more distinct, softer, and more musical, than if they had been spoken through the air.

About the year 1750, a merchant of Cleves, named Jorisen, who had become almost totally deaf, sitting one day near a harpsichord, while some one was playing, and having a tobacco-pipe in his mouth, the bowl of which rested accidentally against the body of the instrument, he was agreeably and unexpectedly surprised to hear all the notes in the most distinct manner. By a little reflection and practice, he again ob-

and they rise into the atmosphere, on the same principle as a piece of cork ascends from the bottom of a pail of water. The aerial travellers are seated in a basket below the balloon, which is attached to it by means of cords. The *parachute* is an invention, by which the voyager, in cases of alarm, may be enabled to desert his balloon in mid-air, and descend, without injury, to the ground. They resemble an umbrella, but are of far greater extent. With one of these contrivances, twenty-three feet in diameter, M. Garnerin, having detached himself from his balloon, descended from a height of more than 4000 feet, and landed without shock or accident.

tained the use of this valuable sense; for he soon learned, by means of a piece of hard wood, one end of which he placed against his teeth, while another person placed the other end on his teeth, to keep up a conversation, and to be able to understand the least whisper. In this way, two persons who have stopped their ears may converse with each other, when they hold a long stick or a series of sticks between their teeth, or rest their teeth against them. The effect is the same, if the person who speaks rests the stick against his throat, or his breast, or when one rests the stick which he holds in his teeth against some vessel into which the other speaks; and the effect will be greater, the more the vessel is capable of tremulous motion. These experiments demonstrate the facility with which the softest whispers may be transmitted. Water also is found to be a good conductor of sound. Dr. Franklin assures us, that he has heard under water, at the distance of half a mile, the sound of two stones struck against each other. It has been also observed, that the *velocity* of sound is much greater in solid bodies, than in the air. By a series of experiments, instituted for the purpose of determining this point, Mr. Chladni found that the velocity of sound, in certain solid bodies, is 16 or 17 times as great as in air.

But what has a more particular bearing on the object hinted at above, is, the experiments lately made by M. Biot, "on the transmission of sound through solid bodies, and through air, in very long tubes." These experiments were made by means of long cylindrical pipes, which were constructing for conduits and aqueducts, to embellish the city of Paris. With regard to the *velocity* of sound, it was ascertained that "its transmission through cast iron is  $10\frac{1}{2}$  times as quick as through air." The pipes by which he wished to ascertain at what distance sounds are audible, were 1,039 yards, or nearly five furlongs, in length. M. Biot was stationed at the one end of this series of pipes, and Mr. Martin, a gentleman who assisted in the experiments, at the other. They heard the lowest voice, so as perfectly to distinguish the words, and to keep up a conversation on all the subjects of the experiments. "I wished," says M. Biot, "to determine the point at which the human voice ceases to be audible, but could not accomplish it: words spoken as low as when we whisper a secret in another's ear, were heard and understood; so that not to be heard, there was but one resource, that of not speaking at all. This mode of conversing with an invisible neighbour is so singular, that we cannot help being surprised, even though acquainted with the cause. Between a question and answer, the interval was not greater than was necessary for the transmission of sound. For Mr. Martin and me, at the distance of 1,039 yards, the time was about  $5\frac{1}{2}$  seconds." Reports of a pistol fired at one end, occasioned

considerable explosion at the other. The air was driven out of the pipe with sufficient force to give the hand a smart blow, to drive light substances out of it to the distance of half a yard, and to extinguish a candle, though it was 1,039 yards distant from the place where the pistol was fired. A detailed account of these experiments may be seen in *Nicholson's Phil. Jour.* for October, 1811. Don Gautier, the inventor of the telegraph, suggested also the method of conveying articulate sounds to a great distance. He proposed to build horizontal tunnels, widening at the remoter extremity, and found that at the distance of 400 fathoms, or nearly half a mile, the ticking of a watch could be heard far better than close to the ear. He calculated that a series of such tunnels would convey a message 900 miles in an hour.

From the experiments now stated, it appears highly probable, that sounds may be conveyed to an indefinite distance. If one man can converse with another at the distance of nearly three quarters of a mile, by means of the softest whisper, there is every reason to believe, that they could hold a conversation at the distance of 30 or 40 miles, provided the requisite tunnels were constructed for this purpose. The latter case does not appear more wonderful than the former. Were this point fully determined, by experiments conducted on a more extensive scale, a variety of interesting effects would follow, from a practical application of the results. A person at one end of a large city, at an appointed hour, might communicate a message, or hold a conversation with his friend, at another; friends in neighbouring, or even in distant towns, might hold an occasional correspondence by articulate sounds, and recognize each other's identity by their tones of voice. In the case of sickness, accident, or death, intelligence could thus be communicated, and the tender sympathy of friends instantly exchanged. A clergyman sitting in his own room in Edinburgh, were it at any time expedient, might address a congregation in Musselburgh or Dalkeith, or even in Glasgow. He might preach the same sermon to his own church, and the next hour to an assembly at forty miles distant. And surely there could be no valid objection to trying the effect of an invisible preacher on a Christian audience. On similar principles, an apparatus might be constructed for augmenting the strength of the human voice, so as to make it extend its force to an assembled multitude, composed of fifty or a hundred thousand individuals; and the utility of such a power, when the mass of mankind are once thoroughly aroused to attend to rational and religious instruction, may be easily conceived. In short, intelligence respecting every important discovery, occurrence, and event, might thus be communicated, through the extent of a whole kingdom, within the space of an hour after it had taken place.

Let none imagine that such a project is either chimerical or impossible. M. Biot's experiment is decisive, so far as it goes, that the softest whisper, without any diminution of its intensity, may be communicated to the distance of nearly three quarters of a mile; and there is nothing but actual experiment wanting to convince us, that the ordinary tones of the human voice may be conveyed to at least twenty times that distance. We are just now acting on a similar principle, in distributing illumination through large cities. Not thirty years ago, the idea of lighting our apartments by an invisible substance, produced at ten miles' distance, would have been considered as chimerical, and as impossible to be realized, as the idea of two persons conversing together, by articulate sounds, at such a distance. It appears no more wonderful, that we should be able to hear at the distance of five or six miles, than that we should be enabled to see objects at that distance by the telescope, as distinctly as if we were within a few yards of them. Both are the effects of those principles and laws which the Creator has interwoven with the system of the material world; and when man has discovered the mode of their operation, it remains with himself to apply them to his necessities. What the telescope is to the eye, acoustic tunnels would be to the ear; and thus, those senses on which our improvement in knowledge and enjoyment chiefly depends, would be gradually carried to the utmost perfection of which our station on earth will permit. And, as to the expense of constructing such communications for sound, the tenth part of the millions of money expended in the twenty-two years' war in which we were lately engaged, would, in all probability, be more than sufficient for distributing them, in numerous ramifications, through the whole island of Great Britain. Even although such a project were partially to fail of success, it would be a far more honourable and useful national undertaking, than that which now occupies the attention of the despots on the continent of Europe, and might be accomplished with far less expenditure, either of blood or of money. Less than the fourth part of a million of pounds would be sufficient for trying an experiment of this kind, on an extensive scale; and such a sum is considered as a mere item, when fleets and armies are to be equipped for carrying destruction through sea and land. When will the war madness cease its rage! When will men desist from the work of destruction, and employ their energies and their treasures in the cause of human improvement! The most chimerical projects that were ever suggested by the most enthusiastic visionary, are not half so ridiculous, and degrading to the character of man, as those ambitious and despotic schemes, in which the powers of the earth in all ages have been chiefly engaged. But on this topic it is needless to

enlarge, till more extended experiments shall have been undertaken.

In the preceding sketches I have presented a few specimens of the relation which the inventions of human ingenuity bear to religious objects. I intended to have traced the same relation in several other instances; in the invention of the electrical machine, the air-pump, mills, clocks and watches, gas-lights, chymical fumigations, inventions for enabling us to walk upon the water, to prevent and alleviate the dangers of shipwreck, &c. &c. But, as my prescribed limits will not permit farther enlargement, I trust that what has been already stated will be sufficient to establish and illustrate my general position. From this subject we may learn—

1st. That the various processes of art, and the exertions of human ingenuity, are under the special direction of Him who arranges all things “according to the counsel of his will.” As “the king’s heart is in the hand of the Lord, and, as the rivers of waters, he turns it whithersoever he pleases,” so all the varied schemes and movements of the human mind, the discoveries of science, and the diversified experiments of mechanics, chymists, and philosophers, are directed in such channels as may issue in the accomplishment of His eternal purposes, in respect to the present and future condition of the inhabitants of our world. This truth is also plainly taught us in the records of inspiration. “Doth the ploughman plough all day to sow? Doth he open and break the clods of his ground? When he hath made plain the face thereof, doth he not cast abroad the fitches, and scatter the cummin,\* and cast in the wheat in the principal [place,] and the barley in the appointed place, and the rye in its proper place? *For his God doth instruct him to discretion, and doth teach him.* This also cometh forth from the Lord of hosts, who is wonderful in counsel, and excellent in working.” Agriculture has, by most nations, been attributed to the suggestions of Deity; for “every good and perfect gift cometh down from the Father of lights.” It is he who hath taught men to dig from the bowels of the earth iron, copper, lead, silver, and gold, and to apply them to useful purposes in social life; and who hath given them “wisdom and understanding” to apply the animal and vegetable productions of nature to the manufacture of cloths, linen, muslin, and silk, for the use and ornament of man.” For “all things are of God.” “Both riches and honour come from him, and he reigneth over all, and in his hand is power and might; and in his hand it is to make great, and to give strength to all.” When the frame of the Mosaic tabernacle and all its curious vessels were to be

constructed, the mind of Bezaleel “was filled with the spirit of God, in wisdom and understanding, and in knowledge, and in all manner of workmanship, to devise curious works in gold, and in silver, and in brass.” And, when the fabric of the New Testament church is to be reared, and its boundaries extended, artificers of every description, adequate for carrying on the different parts of the work are raised up, and inspired with the spirit of their respective departments—some with the spirit of writing, printing, and publishing; some with the spirit of preaching, lecturing, and catechising; some with the spirit of fortitude, to make bold and daring adventures into distant and barbarous climes; and others with the spirit of literature, of science, and of the mechanical arts—all acting as pioneers “to prepare the way of the Lord,” and as builders for carrying forward and completing the fabric of the Christian church.

2dly. All the mechanical contrivances to which I have adverted, all the discoveries of science, and all the useful inventions of genius which may hereafter be exhibited, ought to be viewed as preparing the way for the *millennial* era of the church, and as having a certain tendency to the melioration of the external condition of mankind during its continuance. We are certain, from the very nature of things, as well as from scriptural predictions, that, when this period advances towards the summit of its glory, the external circumstances of this world’s population will be comfortable, prosperous, and greatly meliorated beyond what they have ever been in the ages that are past. “Then shall the earth yield her increase, and God, even our own God, shall bless us. Then shall he give the rain of thy seed, that thou shalt sow thy ground withal; and bread of the increase of the earth; and it shall be fat and plenteous. In that day shall thy cattle feed in large pastures; the oxen likewise and the young asses that ear the ground shall eat savoury provender, which hath been winnowed with the shovel and with the fan. And the inhabitants shall not say, I am sick. They shall build houses and inhabit them, and plant vineyards, and eat the fruit of them. They shall not build, another inhabit; they shall not plant, and another eat; for *as the days of a tree are the days of my people, and mine elect shall long enjoy the work of their hands.* They shall not labour in vain, nor bring forth for trouble; for they are the seed of the blessed of the Lord, and their offspring with them. The seed shall be prosperous, the vine shall give her fruit, and the ground shall give her increase, and the heavens shall give their dew; the evil beasts shall cease out of the land, and they shall sit every man under his vine, and under his fig-tree, and none shall make him afraid; for wars shall cease to the ends of the world, and the knowledge of the

\* *Fitches* is a kind of seed frequently sown in Judea, for the use of cattle; and *cummin* is the seed of a plant somewhat like fennel.

Lord shall cover the earth as the waters cover the sea."\* Diseases will be, in a great measure, banished from the world, and the life of man extended far beyond its present duration—agriculture will be brought to perfection—commodious habitations erected for the comfortable accommodation of all ranks—cities built on elegant and spacious plans, adapted to health, ornament, and pleasure; divested of all the filth, and darkness, and gloom, and narrow lanes, which now disgrace the abodes of men—roads will be constructed on improved principles, with comfortable means of retreat for shelter and accommodation at all seasons; and conveyances invented for the ease, and safety, and rapid conveyance of persons and property from one place to another. Either the climates of the earth will be meliorated, by the universal cultivation of the soil, so that storms and tempests, thunders and lightnings, shall no longer produce their present ravages; or chymical and mechanical contrivances will be invented to ward off their destructive effects. The landscape of the earth will be adorned with vegetable and architectural beauty; and, instead of horse-racing, demoralizing plays, routs and masquerades, boxing and bull-baits—artificial displays of scenery will be exhibited, more congenial to the dignity of rational, renovated, and immortal minds. For "the knowledge of the Lord," and the "beauties of holiness," will pervade men of all ranks and ages, "from the least even to the greatest."†

Now, as we have no reason to expect any *miraculous interference*, we must regard the past and the future useful inventions of philosophy and mechanics, as having a bearing on this glorious period, and a tendency to promote the improvement and the felicity of those who shall

\* Psalm lxxvii. Isaiah xxx. 23, 24, xxxiii. 24. lxx. 21, 22, &c.

† The various circumstances above stated may be considered as the *natural results* of a state of society on which the light of science and of revelation has diffused its full influence, and where the active powers of the human mind are invariably directed by the pure principles and precepts of Christianity. That the duration of human life, at the era referred to, will be extended beyond its present boundary, appears to be intimated in some of the passages above quoted particularly the following—"As the days of a tree shall be the days of my people, and mine elect shall long enjoy the work of their hands." And, if the life of man will be thus protracted to an indefinite period, it will follow, that those diseases which now prey upon the human frame, and cut short its vital action, will be in a great measure extirpated. Both these effects may be viewed (without supposing any miraculous interference) as the natural consequence of that happiness and equanimity of mind which will flow from the practice of Christian virtues, from the enlargement of our knowledge of the principles of nature, and from the physical enjoyments which such a state of society will furnish.

live during this era of Messiah's reign. If diseases are to be generally abolished, it will be owing to the researches of the scientific physician in discovering certain antidotes against every disorder, and to the practice of temperance, meekness, equanimity of mind, and every other mean of preserving the vigour of the animal frame. If the earth is to produce its treasures in abundance, and with little labour, it will be owing in part to the improvement of agricultural science and of the instruments by which its operations are conducted. If the lightnings of heaven shall no longer prove destructive to man and to the labours of his hands, it will be effected either by machinery for drawing off the electricity of a stormy cloud, or by the invention of *thunder-guards*, which shall afford a complete protection from its ravages. In these, and numerous other instances, the inventions of men, under the guidance of the Spirit of wisdom, will have a tendency to remove a great part of the *curse* which has so long hung over our sinful world. And since the inventions of human skill and ingenuity for the melioration of mankind, and for the swift conveyance of intelligence, have, of late years, been rapidly increasing, at the same time when the Christian world is roused to increased exertions in disseminating the Scriptures throughout all lands, when general knowledge is increasingly diffused, and when the fabric of superstition and despotism is shaking to its foundations—these combined and simultaneous movements seem plainly to indicate, that that auspicious era is fast hastening on, when "the glory of Jehovah shall be revealed, and all flesh shall see it together," when "righteousness and praise shall spring forth before all nations," and when "holiness to the Lord" shall be inscribed on all the pursuits, and implements, and employments of men.

Lastly,—If the remarks suggested above be well founded, we may conclude, that the mechanical and philosophical inventions of genius are worthy of the attentive consideration of the enlightened Christian; particularly in the relation they may have to the accomplishment of religious objects. He should contemplate the experiments of scientific men, not as a waste of time, or the mere gratification of an idle curiosity, but as embodying the germs of those improvements, by which civilization, domestic comfort, knowledge, and moral principle may be diffused among the nations. To view such objects with apathy and indifference, as beneath the regard of a religious character, argues a weak and limited understanding, and a contracted view of the grand operations of a superintending Providence.

## CHAPTER IV.

## SCRIPTURAL DOCTRINES AND FACTS ILLUSTRATED FROM THE SYSTEM OF NATURE.\*

WITHOUT spending time in any introductory observations on this subject, it may be remarked in general,

*I.—That scientific knowledge, or an acquaintance with the system of nature, may frequently serve as a guide to the true interpretation of Scripture.*

It may be laid down as a universal principle, that there can be no real discrepancy between a just interpretation of Scripture and the facts of physical science; and on this principle, the following canon is founded, which may be considered as an infallible rule for Scripture interpretation, namely,—*That no interpretation of Scripture ought to be admitted which is inconsistent with any well-authenticated facts in the material world.* By *well-authenticated facts*, I do not mean the theories of philosophers, or the deductions they may have drawn from them, nor the confident assertions or plausible reasonings of scientific men in support of any prevailing system of natural science; but those facts which are universally admitted, and the reality of which every scientific inquirer has it in his power to ascertain: such as that the earth is not an extended plane, but a round or globular body, and that the rays of the sun, when converged to a focus by a large convex glass, will set fire to combustible substances. Such facts, when ascertained, ought to be considered as a revelation from God, as well as the declarations of his word. For they make known to us a portion of his character, of his plans and his operations.—This rule may be otherwise expressed as follows:—*Where a passage of Scripture is of doubtful meaning, or capable of different interpretations, that interpretation ought to be preferred which will best agree with the established discoveries of science.* For since the Author of revelation and the Author of universal nature is one and the same infinite being,—there must exist a complete harmony between the revelations of his word, and the facts or relations which are observed in the material universe. To suppose the contrary, would be to

suppose the Almighty capable of inconsistency a supposition which would go far to shake our confidence in the theology of nature, as well as of revelation. If, in any one instance, a record claiming to be a revelation from heaven were found to contradict a well-known fact in the material world; if, for example, it asserted, in express terms, to be literally understood, that the earth is a quiescent body in the centre of the universe, or that the moon is no larger than a mountain; it would be a fair conclusion, either that the revelation was not divine, or that the passages embodying such assertions are interpolations, or that science, in reference to these points, has not yet arrived at the truth. The example, we are aware, is inapplicable to the Christian revelation, which rests securely on its own basis, and to which science is gradually approximating, as it advances in the amplitude of its views, and the correctness of its deductions;—but it shows us how necessary it is, in interpreting the word of God, to keep our eye fixed upon his works; for we may rest assured, that truth in the one will always correspond with fact in the other.

To illustrate the rule now laid down, an example or two may be stated. If it be a fact that geological research has ascertained that the materials of the strata of the earth are of a more ancient date than the Mosaic account of the commencement of the present race of men; the passages in the first chapter of Genesis, and other parts of Scripture, which refer to the origin of our world, must be explained as conveying the idea, that the earth was then merely arranged into its present form and order, out of the materials which previously existed in a confused mass, and which had been created by the Almighty at a prior period in duration. For Moses nowhere asserts, that the materials of our globe were created, or brought into existence out of nothing, at the time to which his history refers; but insinuates the contrary. “For the earth” says he, prior to its present constitution, “was without form and void,” &c. Again, if it be a fact that the universe is indefinitely extended, that, of many millions of vast globes which diversify the voids of space, only two or three have any immediate connexion with the earth, then it will appear most reasonable to conclude, that those expressions in the Mosaic history of the creation, which refer to the creation of the fixed stars, are not to be understood as referring

\* Under this head, it was originally intended to embrace an elucidation of a considerable variety of the facts recorded in sacred history, and of the allusions of the inspired writers to the system of nature; but as the volume has already swelled beyond the limits proposed, I am reluctantly compelled to confine myself to the illustration of only two or three topics.

to the time when they were brought into existence, as if they had been created about the same time with our earth; but, as simply declaring the fact, that, at what period soever in duration they were created, *they derived their existence from God*. That they did not all commence their existence at that period, is demonstrable from the fact, that, within the space of 2000 years past, and even within the space of the two last centuries, new stars have appeared in the heavens which previously did not exist in the concave of the firmament; which, consequently, have been created since the Mosaic period; or, at least, have undergone a change analogous to that which took place in our globe, when it emerged from a chaotic state to the form and order in which we now behold it. Consequently, the phrase, "God rested from all his works," must be understood not absolutely, or in reference to the whole system of nature, but merely in relation to our world; and as importing, that the Creator then ceased to form any new species of beings on the *terrestrial globe*. The same canon will direct us in the interpretation of those passages which refer to the last judgment, and the destruction of the present constitution of our globe. When, in reference to these events, it is said, "that the stars shall fall from heaven," that "the powers of heaven shall be shaken," and that "the earth and the heaven shall flee away," our knowledge of the system of nature leads us to conclude, either that such expressions are merely metaphorical, or that they describe only the *appearance*, not the *reality* of things. For it is impossible that the stars can ever fall to the earth, since each of them is of a size vastly superior to our globe, and could never be attracted to its surface, without unhinging the laws and the fabric of universal nature. The *appearance*, however, of the "heaven fleeing away," would be produced, should the earth's diurnal rotation at that period be suddenly stopped, as will most probably happen; in which case, all nature, in this sublunary system, would be thrown into confusion, and the heavens, with all their host, would appear to flee away.

Now, the scientific student of Scripture alone can judiciously apply the canon to which I have adverted; he alone can appreciate its utility in the interpretation of the sacred oracles; for he knows the facts which the philosopher and the astronomer have ascertained to exist in the system of nature; from the want of which information, many divines, whose comments on Scripture have, in other respects, been judicious, have displayed their ignorance, and fallen into egregious blunders, when attempting to explain the first chapters of Genesis, and several parts of the book of Job, which have tended to bring discredit on the oracles of heaven.

II.—*The system of nature confirms and illustrates the scriptural doctrine of the DEPRAVITY OF MAN.*

In the preceding parts of this volume, I have stated several striking instances of divine benevolence, which appear in the construction of the organs of the animal system, in the constitution of the earth, the waters, and the atmosphere, and in the variety of beauties and sublimities which adorn the face of nature; all which proclaim, in language which can scarcely be mistaken, that the Creator has a special regard to the happiness of his creatures. Yet the Scriptures uniformly declare, that man has fallen from his primeval state of innocence, and has violated the laws of his Maker; that "his heart is deceitful above all things, and desperately wicked;" and that "destruction and misery are in his ways." Observation and experience also demonstrate, that a moral disease pervades the whole human family, from the most savage to the most civilized tribes of mankind; which has displayed its virulence in those wars and devastations which have, in all ages, convulsed the world; and which daily displays itself in those acts of injustice, fraud, oppression, malice, tyranny, and cruelty, which are perpetrated in every country, and among all the ranks even of civilized life. That a world inhabited by moral agents of this description would display, in its physical constitution, certain indications of its Creator's displeasure, is what we should naturally expect, from a consideration of those attributes of his nature with which we are acquainted. Accordingly, we find, that, amidst all the evidences of benevolence which our globe exhibits, there are not wanting certain displays of "the wrath of Heaven against the ungodliness and unrighteousness of men," in order to arouse them to a sense of their guilt, and to inspire them with reverence and awe of that Being whom they have offended. The following facts, among many others, may be considered as corroborating this position.

In the first place, *the present state of the interior strata of the earth* may be considered as a presumptive evidence, that a moral revolution has taken place since man was placed upon the globe. When we penetrate into the interior recesses of the earth, we find its different strata bent into the most irregular forms; sometimes lying horizontally, sometimes projecting upwards, and sometimes downwards, and thrown into confusion; as if some dreadful concussion had spread its ravages through every part of the solid crust of our globe. This is visible in every region of the earth. Wherever the miner penetrates among its subterraneous recesses, wherever the fissures and caverns of the earth are explored, and wherever the mountains lay bare their rugged cliffs,

the marks of ruin, convulsion, and disorder meet the eye of the beholder. Evidences of these facts are to be found in the records of all intelligent travellers and geologists who have visited Alpine districts, or explored the subterraneous regions of the earth; of which I have already stated a few instances, in the article of *Geology*, pp. 74, 75, 77. These facts seem evidently to indicate that the earth is not now in the same state in which it originally proceeded from the hand of its Creator; for such a scene of disruption and derangement appears incompatible with that order, harmony, and beauty which are apparent in the other departments of nature. We dare not assert, that such terrible convulsions took place by chance, or independent of the will of the Creator; nor dare we insinuate, that they were the effects of a random display of Almighty Power; and therefore, we are necessarily led to infer, that a moral cause, connected with the conduct of the rational inhabitants of the globe, must have existed, to warrant so awful an interposition of divine power; for the fate of the animated beings which then peopled the earth was involved in the consequences which must have attended this terrible catastrophe. The volume of revelation, on this point, concurs with the deductions of reason, and assigns a cause adequate to warrant the production of such an extraordinary effect. "The wickedness of man was great upon the earth; the earth was *filled with violence*; every purpose and desire of man's heart was *only evil continually*. Man had frustrated the end of his existence; the earth was turned into a habitation of demons; the long period to which his life was protracted only served to harden him in his wickedness, and to enable him to carry his diabolical schemes to their utmost extent, till the social state of the human race became a scene of unmixed depravity and misery. And the physical effects of the punishment of this universal defection from God are presented to our view in every land, and will remain to all ages, as a visible memorial that man has rebelled against the authority of his Maker.

2. *The existence of Volcanoes, and the terrible ravages they produce*, bear testimony to the state of man as a depraved intelligence. A volcano is a mountain, generally of an immense size, from whose summit issue fire, smoke, sulphur, and torrents of melted lava, (see p. 66.) Previous to an eruption, the smoke, which is continually ascending from the crater, or opening in the top, increases and shoots up to an immense height; forked lightning issues from the ascending column; showers of ashes are thrown out to the distance of forty or fifty miles; volleys of red-hot stones are discharged to a great height in the air; the sky appears thick and dark; the luminaries of heaven disappear; and these

terrible forebodings are accompanied with thunder, lightning, frequent concussions of the earth, and dreadful subterraneous bellowings. When these alarming appearances have continued sometimes four or five months, the lava begins to make its appearance, either boiling over the top, or forcing its way through the side of the mountain. This fiery deluge of melted minerals rolls down the declivity of the mountain, forming a diurnal flaming stream, sometimes fourteen miles long, six miles broad, and 200 feet deep. In its course, it destroys orchards, vineyards, cornfields, and villages; and sometimes cities, containing twenty thousand inhabitants, have been swallowed up and consumed. Several other phenomena, of awful sublimity, sometimes accompany these eruptions. In the eruption of Vesuvius, in 1794, a shock of an earthquake was felt; and, at the same instant, a fountain of bright fire, attended with the blackest smoke, and a loud report, was seen to issue, and to rise to a great height from the cone of the mountain; and was soon succeeded by fifteen other fiery fountains, all in a direct line extending for a mile and a half downwards. This fiery scene was accompanied with the loudest thunder, the incessant reports of which, like those of a numerous heavy artillery, were attended by a continued hollow murmur, similar to that of the roaring of the ocean during a violent storm. The houses in Naples, at seven miles' distance, were for several hours in a constant tremor; the bells ringing, and doors and windows incessantly rattling and shaking. The murmur of the prayers and lamentations of a numerous population added to the horrors of the scene. All travellers, who have witnessed these eruptions, seem to be at a loss to find words sufficiently emphatic to express the terrors of the scene. "One cannot form a juster idea," says Bishop Berkley, "of the noise emitted by the mountain, than by imagining a mixed sound made up of the raging of a tempest, the murmur of a troubled sea, and the roaring of thunder and artillery, confused altogether. Though we heard this at the distance of twelve miles, yet it was *very terrible*." In 1744, the flames of Cotopaxi, in South America, rose 3,000 feet above the brink of the crater, and its roarings were heard at the distance of *six hundred miles*. "At the port of Guayaquil, 150 miles distant from the crater," says Humboldt, "we heard, day and night, the noise of this volcano, like continued discharges of a battery, and we distinguished these tremendous sounds even on the Pacific ocean."

The ravages produced by volcanoes are in proportion to the terror they inspire. In the eruption of *Ætna*, in 1669, the stream of lava destroyed, in 40 days, the habitations of 27,000 persons; and of 20,000 inhabitants of the city of Catania, only 3,000 escaped. In the year 79, the celebrated cities of Pompeii and Herculaneum

lancum were completely overwhelmed and buried under ground by an eruption of Vesuvius, and the spots on which they stood remained unknown for 1600 years. Since that period, about 40 eruptions have taken place, each of them producing the most dreadful ravages. But the volcanoes of Asia and America are still more terrible and destructive than those of Europe. The volcanic mountain Pichinca, near Quito, caused, on one occasion, the destruction of 35,000 inhabitants. In the year 1772, an eruption of a mountain in the island of Java destroyed 40 villages, and several thousands of the inhabitants; and in October, 1822, eighty-eight hamlets, and above 2000 persons, were destroyed in the same island, by a sudden eruption from a new volcano. The eruption of Tomboro, in the island of Sumbawa, in 1815, was so dreadful, that all the Moluccas, Java, Sumatra, and Borneo, to the distance of a thousand miles from the mountain, felt tremulous motions, and heard the report of explosions. In Java, at the distance of 340 miles, the clouds of ashes from the volcano produced utter darkness.

Volcanoes are more numerous than is generally imagined. They are to be found in every quarter of the world, from the icy shores of Kamtschatka to the mountains of Patagonia. Humboldt enumerates 40 volcanoes constantly burning, between Cotopaxi and the Pacific ocean; 20 have been observed in the chain of mountains that stretches along Kamtschatka; and many of them are to be seen in the Philippines, the Moluccas, the Cape de Verd, the Sandwich, the Ladrone, and other islands in the Indian and Pacific oceans. It is stated in vol. 6th of *Sup. to Ency. Brit.* lately published, that about 205 volcanoes are known, including only those which have been active within a period to which history or tradition reaches. Europe contains 14; and, of the whole number, it is computed, that 107 are in islands and 98 on the great continents.

Can we then suppose, that so many engines of terror and destruction, dispersed over every quarter of the globe, are consistent with the conduct of a benevolent Creator towards an innocent race of men? If so, we must either admit that the Creator had it not in his power, when arranging our terrestrial system, to prevent the occasional action of these dreadful ravagers, or that he is indifferent to the happiness of his innocent offspring. The former admission is inconsistent with the idea of his omnipotence, and the latter with the idea of his universal benevolence. It is not therefore, enthusiasm, but the fairest deduction of reason to conclude, that they are indications of God's displeasure against a race of transgressors who have apostatized from his laws.

3. The same reasoning will apply to the ravages produced by earthquakes. Next to volca-

noes, earthquakes are the most terrific phenomena of nature, and are even far more destructive to man, and to the labours of his hands. An earthquake, which consists in a sudden motion of the earth, is generally preceded by a rumbling sound, sometimes like that of a number of carriages driving furiously along the pavement of a street, sometimes like the rushing noise of a mighty wind, and sometimes like the explosions of artillery. Their effect on the surface of the earth is various. Sometimes it is instantaneously heaved up in a perpendicular direction, and sometimes it assumes a kind of rolling motion, from side to side. The ravages which earthquakes have produced, are terrible beyond description; and are accomplished almost in a moment. In 1692, the city of Port-Royal, in Jamaica, was destroyed by an earthquake, in the space of two minutes, and the houses sunk into a gulf forty fathoms deep. In 1693, an earthquake happened in Sicily, which either destroyed, or greatly damaged, fifty-four cities, and an incredible number of villages. The city of Catania was utterly overthrown: the sea all of a sudden began to roar; mount *Ætna* to send forth immense spires of flame; and immediately a shock ensued, as if all the artillery in the world had been discharged. The birds flew about astonished; the sun was darkened; the beasts ran howling from the hills; a dark cloud of dust covered the air; and, though the shock did not last three minutes, yet nineteen thousand of the inhabitants of the city perished in the ruins. This shock extended to a circumference of 7000 miles.

Earthquakes have been producing their ravages in various parts of the world, and in every age. Pliny informs us, that 12 cities in Asia Minor were swallowed up in one night. In the year 115, the city of Antioch, and a great part of the adjacent country, were buried by an earthquake. About 300 years after, it was again destroyed, along with 40,000 inhabitants; and, after an interval of only 60 years, it was a third time overturned, with the loss of not less than 60,000 souls. In 1755, Lisbon was destroyed by an earthquake, and it buried under its ruins above 50,000 inhabitants. The effects of this terrible earthquake were felt over the greater part of Europe and Africa, and even in the midst of the Atlantic ocean; and are calculated to have extended over a space of not less than four millions of square miles. In August, 1822, two-thirds of the city of Aleppo, which contained 40,000 houses, and 200,000 inhabitants, were destroyed by an earthquake, and nearly thirty thousand inhabitants were buried under the ruins. To suppose that the human beings who have been victims to the ravages of earthquakes and volcanoes, "were sinners above all those who dwelt around them," would be a height of impiety and presumption. But,

fact that thousands of rational beings have been swept from existence, in a manner so horrible and tremendous, seems plainly to indicate, that they belonged to a race of apostate intelligences, who had violated the commands of their Creator. Such visitations are quite accordant to the idea of man being in the condition of a transgressor; but, if he were an innocent creature, they would be altogether unaccountable, as happening under the government of a Being of unbounded benevolence.

4. The phenomena of *thunder-storms, tempests, and hurricanes*, and the ravages they produce, are also presumptive proofs that man is a depraved intelligence. In that season of the year when Nature is arrayed in her most beautiful attire, and the whole terrestrial landscape tends to inspire the mind with cheerfulness—suddenly a sable cloud emerges from the horizon—the sky assumes a baleful aspect—a dismal gloom envelopes the face of nature—the lightnings flash from one end of the horizon to another—the thunders roll with awful majesty along the verge of heaven, till at length they burst over head in tremendous explosions. The sturdy oak is shattered and despoiled of its foliage; rocks are rent into shivers; and the grazing herds are struck into a lifeless group. Even man is not exempted from danger in the midst of this appalling scene. For hundreds in every age have fallen victims either to the direct stroke of the lightning, or to the concussions and conflagrations with which it has been attended. In tropical countries, the phenomena of thunder-storms are more dreadful and appalling, than in our temperate climate. The thunder frequently continues for days and weeks in almost one incessant roar; the rains are poured down in torrents; and the flashes of lightning follow each other in so rapid a succession, that the whole atmosphere and the surrounding hills seem to be in a blaze. In some instances, the most dreadful effects have been produced by the bursting of an electrical cloud. In 1772, a bright cloud was observed at midnight to cover a mountain in the island of Java; it emitted globes of fire so luminous, that the night became as clear as day. Its effects were astonishing. Every thing was destroyed for 7 leagues round; houses were demolished; plantations buried in the earth; and 2140 people lost their lives, besides 1500 head of cattle, and a vast number of horses and other animals.—*Ency. Brit. Art. Cloud.*

Is it not reasonable, then, to conclude, that such awful phenomena as storms, volcanoes, and earthquakes, are so many occasional indications of the frown of an offended Creator upon a race of transgressors, in order to arouse them to a sense of their apostacy from the God of heaven? We cannot conceive that such physical operations, accompanied by so many terrific and destructive effects, are at all compatible with the

idea that man is at present in a paradisaical state, and possessed of that moral purity in which he was created. Such appalling displays of almighty power are in complete unison with the idea, that man is a transgressor, and that the present dispensations of God are a mixture of mercy and of judgment; but if he belong to an innocent race of moral intelligences, they appear quite anomalous, and are altogether inexplicable, on the supposition, that a Being of infinite benevolence and rectitude directs the operations of the physical and moral world; more especially when we consider the admirable care which is displayed in the construction of animal bodies, in order to prevent pain, and to produce pleasurable sensations. When man was first brought into existence, his thoughts and affections, we must suppose, were in unison with the will of his Creator; his mind was serene and unruffled; and, consequently, no foreboding apprehensions of danger would, in such a state, take possession of his breast. But after he had swerved from the path of primeval rectitude, and especially after the deluge had swept away the inhabitants of the antediluvian world, the constitution of the earth and the atmosphere seems to have undergone a mighty change, corresponding to the degraded state into which he had fallen; so that those very elements which may have formerly ministered to his enjoyment—by being formed into different combinations—now conspire to produce terror and destruction.

The same important conclusion might have been deduced, from a consideration of the immense deserts of marshes and barren sands which are dispersed over the globe—the vast and frightful regions of ice around the poles—the position of the mineral strata, and the vast disproportion which the extent of the dry land bears to the expanse of the ocean—all which circumstances, and many others, in conjunction with the facts above stated, conspire to show, that man no longer stands in the rank of a pure intelligence; and that his habitation corresponds, in some degree, to his state of moral degradation. By overlooking this consideration, St. Pierre and other naturalists have found themselves much at a loss, when attempting to vindicate the wisdom and equity of Providence, in the physical disorders which exist in the present constitution of our globe. The circumstance, that man is a fallen creature, appears the only clue to guide us in unravelling the mysteries of Providence, and to enable us to perceive the *harmony* and *consistency* of the divine operations in the system of nature; and no other consideration will fully account for the disorders which exist in the present economy of our world.

But it is a most consoling consideration, that, amidst all the physical evils which abound, the benevolence and mercy of God are admirably blended with the indications of his displeasure.

Thunder-storms and tempests contribute to the purification of the atmosphere; and volcanoes are converted into funnels for vomiting up those fiery materials which produce earthquakes, and which might otherwise swallow up whole provinces in one mighty gulf. In the ordinary course of things, such phenomena are more terrific than destructive; and are calculated rather to rouse an unthinking world to consideration, than to prove the instruments of human destruction. Compared with the miseries which men have voluntarily inflicted on one another, the destructive effects of the elements of nature dwindle into mere temporary and trifling accidents. We have reason to believe, that a much greater destruction of human beings has been produced by two or three of the late battles in modern Europe, such as those of Waterloo, Borodina, and Smolensko, than has been produced by all the electrical storms, earthquakes, and volcanic eruptions, which have raged for the space of a hundred years. It has been calculated, that during the Russian campaign of 1812, including men, women, and children, belonging to the French and Russians, there were not less than five hundred thousand human victims sacrificed to the demon of war. It is probable, that the destruction produced among the human race, by the convulsions of nature, since the commencement of time, (the deluge only excepted,) does not amount to above four or five millions of lives; but were we take into account the destruction of human life produced by ambition, tyranny, oppression, superstition, wars, devastations, murders, and horrid cruelties, in every period of the world, it would, doubtless, amount to several hundreds of millions. So that, amidst the most terrible displays of the displeasure of God against the sins of men, mercy is mingled with judgment; and while man is the greatest enemy and destroyer of his own species, benevolence is the prominent feature of all the arrangements of the Deity in the physical world. For "his tender mercies are over all his works."\*

III.—*The discoveries which have been made in the system of nature, illustrate the doctrine of the RESURRECTION OF THE DEAD.*

The doctrine of a resurrection from the dead, at first view, appears to involve in it a variety of difficulties, and apparent contradictions. That a complex organical machine, as the human body is, consisting of thousands of diversified parts for the performance of its functions, after it has been reduced to atoms, and those atoms dispersed

\*The facts stated in this section are expressed for the most part in the author's own words, for the sake of compression. His authorities are, Goldsmith's "Natural History," Humboldt's "Travels," Brydon's, "Tour," Sir W. Hamilton's "Observations," Raffles' "History of Java," *Ency. Brit. Art. Etna, Volcano, Earthquake, Antioch, Cloud*; The Literary and Scientific Journals for 1822, &c

to "the four winds of heaven"—should he again reared up with the same materials, in a new and more glorious form—is an idea which seems to baffle the human comprehension; and, in all probability, would never have entered the mind of man, had it not been communicated by divine revelation. Accordingly we find, that the philosophers of antiquity, though many of them believed in the doctrine of a future state, never once dreamed, that the bodies of men, after they had been committed to the dust, would ever again be reanimated; and hence, when the apostle Paul proposed this doctrine to the Athenian philosophers, they scouted the idea, as if it had been the reverie of a madman. And, indeed, without a strong conviction, and a lively impression of the infinite power and intelligence of God, the mind cannot rely with unshaken confidence on the declaration of a future fact so widely different from all the obvious phenomena of nature, and from every thing that lies within the range of human experience. "If a man die," says Job, "shall he live again? There is hope of a tree, if it be cut down, that it will sprout again, and bring forth boughs like a plant. But man dieth and wasteth away; yea, man giveth up the ghost, and where is he?" When the mind, however, is frequently exercised in contemplations on the stupendous works of the Almighty, it must feel an impressive conviction, that "nothing can be too hard for Jehovah." When we endeavour to draw aside the veil which conceals many of the scenes of nature from the vulgar eye, we perceive a variety of operations and analogies, which tend to assist us in forming a conception, not only of the possibility of a resurrection, but also of the manner in which it may probably be effected, when the power of Omnipotence is interposed.

The transformations of insects afford us a beautiful illustration of this subject. All the butterflies which we see fluttering about in the summer months, were originally caterpillars. Before they arrive at that highest stage of their existence, they pass through four different transformations. The first state of a butterfly is that of an egg; it next assumes the form of a loathsome crawling worm; after remaining some time in this state, it throws off its caterpillar skin; languishes; refuses to eat; ceases to move, and is shut up, as it were, in a tomb. In this state, the animal is termed a *chrysalis*; it is covered with a thin crust or shell, and remains sometimes for six or eight months without motion, and apparently without life. After remaining its allotted time in this torpid condition, it begins to acquire new life and vigour; it bursts its imprisonment, and comes forth a butterfly with wings tinged with the most beautiful colours. It mounts the air; it ranges from flower to flower, and seems to rejoice in its new and splendid existence. How very different does it

appear in this state from what it did in the preceding stages of its existence! How unlikely did it seem that a rough, hairy, crawling worm, which lay for such a length of time in a death-like torpor, and enshrouded in a tomb, should be re-animated, as it were, and changed into so beautiful a form, and endowed with such powers of rapid motion! Perhaps the change to be effected on the bodies of men, at the general resurrection, may not be greater, nor more wonderful in its nature, than are the changes which take place from the first to the last stage of a caterpillar's existence. In such transformations, then, we behold a lively representation of the death and resurrection of a righteous man. "A little while he shall lie in the ground, as the seed lies in the bosom of the earth; but he shall be raised again, and shall never die any more."

There is another illustration, taken from a consideration of the chymical changes of matter, which has a still more direct bearing on the doctrine of a resurrection. We know, that substances which are invisibly incorporated with air, water, and other fluids, and which seem to be destroyed, may be made to reappear in their original form by the application of certain chymical agents. For example; put a small piece of solid camphor into a phial half filled with alcohol or spirits of wine; in a short time the camphor will be dissolved in the fluid, and the spirit will be as transparent as at first. If water be now added, it will unite with the ardent spirit, and the camphor will be separated and fall to the bottom of the phial. In this way the camphor may be nearly all recovered as at first; and, by distillation, the alcohol may also be separated from the water, and exhibited in a separate state. I have already noticed, that carbon, which forms an essential part of all animal and vegetable substances, is found to be not only indestructible by age, but in all its combinations, which are infinitely diversified, it still preserves its identity. In the state of carbonic acid it exists in union with earths and stones in unbounded quantities; and though buried for thousands of years beneath immense rocks, or in the centre of mountains, it is still carbonic acid; for no sooner is it disengaged from its dormitory than it rises with all the life and vigour of recent formation, not in the least impaired by its torpid inactivity during a lapse of ages. The beams of the theatre at Herculaneum were converted into charcoal (which is one of the compounds of carbon) by the lava which overflowed that city, during an eruption of Mount Vesuvius; and during the lapse of 1700 years, the charcoal has remained as entire as if it had been formed but yesterday, and it will probably continue so to the end of the world. In addition to these facts it may be stated, that provision has been made for the restoration of the fallen leaves of vegetables which lie upon the ground, and, to a careless observer,

would appear to be lost for ever. It has been shown by experiment, that whenever the soil becomes charged with such matter, the oxygen of the atmosphere combines with it, and converts it into carbonic acid gas. The consequence of which is, that this very same carbon is, in process of time, absorbed by a new race of vegetables, which it clothes with a new foliage, and which is itself destined to undergo similar putrefaction and renovation to the end of time."\*

These facts and others of a similar description which might have been stated, demonstrate, that one of the constituent parts of animal bodies remains unalterably the same, amidst all the revolutions of time, and all the changes and decompositions which take place in the system of nature; and, consequently, that though human bodies may remain in a state of putrefaction for ages in the earth and in the waters, yet their component parts remain unchanged, and in readiness to enter into a new and more glorious combination, at the command of that *Intelligence* to whom all the principles of nature and all their diversified changes are intimately known; and whose *Power* is able to direct their combinations to the accomplishment of his purposes.— Though such considerations as these may have no weight on certain unreflecting minds, that never meet with any difficulties in the economy either of nature or of redemption; yet, the man of deep reflection, who has frequently had his mind distracted with the apparent improbability of the accomplishment of certain divine declarations, will joyfully embrace such facts in the economy of nature, as a sensible support to his faith in the promises of his God; and will resign his body to dust and putrefaction, in the firm hope of emerging from the tomb to a future and more glorious transformation.

#### IV. *The discoveries of science tend to illustrate the doctrine of the GENERAL CONFLAGRATION.*

We are informed, in the Sacred Oracles, that a period is approaching, when "the elements shall melt with fervent heat, and the earth, and the works that are therein, shall be burned up." Science has ascertained certain facts in the constitution of nature, which lead us to form some conception of the manner in which this awful catastrophe may probably be effected, and also of the ease with which it may be accomplished, when the destined period shall have arrived. It was formerly stated, (pp. 35, 104,) that the atmosphere, or the air we breathe, is a compound substance, composed of two very different and opposite principles, termed oxygen and nitrogen. The oxygen, which forms about a fifth part of the atmosphere, is now ascertained to be the principle of flame; a lighted taper immersed in this gas, burns with a brilliancy too

\* Parkes's "Chym. Catechism," p. 266, and the additional notes.

great for the eye to bear ; and even a rod of iron or steel is made to blaze under its energy.

The modern infidel, like the scoffers of old, scouts the idea of the dissolution of the world, and of the restitution of the universe, "because all things continue as they were from the beginning of the creation; not knowing the Scriptures, nor the power of God;" and not considering the principles and facts in the system of nature, which indicate the possibility of such an event. But, from the fact now stated, we may learn how easily this effect may be accomplished, even in conformity with those laws which now operate in the constitution of our globe. For should the Creator issue forth his almighty fiat—"Let the nitrogen of the atmosphere be completely separated from the oxygen, and let the oxygen exert its native energies without control, wherever it extends;"—from what we know of its nature, we are warranted to conclude, that instantly a universal conflagration would commence throughout all the kingdoms of nature—not only wood, coals, sulphur, bitumen, and other combustible substances, but even the hardest rocks and stones, and all the metals, fossils, and minerals, and water itself, which is a compound of two inflammable substances, would blaze with a rapidity which would carry destruction through the whole expanse of the terraqueous globe, and change its present aspect into that of a new world:—at the same time, all the other laws of nature might still operate as they have hitherto done since the creation of the world.

I do not mean positively to assert, that this is the agent which the Almighty will certainly employ for accomplishing this terrible catastrophe, (though we think it highly probable,) since Infinite Power is possessed of numerous resources for accomplishing its objects, which lie beyond the sphere of our knowledge and comprehension. But I have brought forward this fact, to show with what infinite ease this event may be accomplished, when Almighty Power is interposed. By means of the knowledge we have acquired of the constitution of the atmosphere, and by the aid of chymical apparatus, we can perform experiments on a *small scale*, similar in kind, though infinitely inferior in degree, to the awful event under consideration. And, therefore, we can easily conceive that He who formed the expansive atmosphere which surrounds us, and who knows the native energy of its constituent principles, may, by a simple volition, make that invisible fluid, in a few moments, the cause of the destruction of the present constitution of our world, and, at the same time, the means of its subsequent renovation. For, as fire does not annihilate, but only changes, the forms of matter, this globe on which we now tread, and which bears the marks of

ruin and disruption in several parts of its structure, may come forth from the flames of the general conflagration, purified from all its physical evils, adorned with new beauties and sublimities, and rendered a fit habitation for pure intelligences, either of our own species or of another order. For, though the "heavens," or the atmosphere, "shall be dissolved, and the elements melt with fervent heat;" "yet," says the Apostle Peter, "we, according to his promise, look for new heavens and a new earth, wherein dwelleth righteousness." Whether, after being thus renovated it shall be allotted as the residence of the redeemed inhabitants of our world, is beyond our province at present to determine. But if not, it will, in all probability, be allotted as the abode of other rational beings, who may be transported from other regions, to contemplate a new province of the divine empire, or who may be immediately created for the purpose of taking possession of this renovated world. For we have reason to believe, that the energies of creating power will be continually exerted, in replenishing the boundless universe, throughout all the ages of infinite duration, and that no substances or worlds which God has created, will ever be suffered to fall into annihilation—at least, that the original atoms of matter will never be destroyed, whatever new forms they may assume, and however varied the combinations into which they may enter.

The above are only a few examples out of many which were intended to be specified, of the illustrations which the system of nature affords of the doctrines and facts of revelation, but the narrow limits of this volume prevent further enlargement.

It was also intended to follow up the preceding discussions with particular illustrations of the following topics:—The views which science affords of the *incessant energies of creating power*—the changes and revolutions which appear to have happened, and which are still going on in the distant regions of the universe, *as tending to amplify our views of the grand and multifarious objects over which Divine Providence presides*—the *connexion of science with a future state*—the aids which the discoveries of science afford, in enabling us to form a conception of the scenes of future felicity—of the employments of the heavenly inhabitants, and of their perpetual advances in knowledge and happiness, and in their views of the perfections of Deity—the *moral relations of intelligent beings* to their Creator, and to each other; and the *physical grounds or reasons* of those moral laws which the Deity has promulgated for regulating the conduct, and for promoting the harmony and order of intelligent agents—illustrations of the allusions of the sacred writers to the system of the material world

—the simultaneous progress of science and religion, considered as an evidence of the connexion of the one with the other—the moral effects of the study of science in connexion with religion—replies to objections and insinuations which have been thrown out against the idea of combining the discoveries of science with the discoveries of revelation, &c. But, as illustrations of these, and various other topics connected with them, would occupy two or three

hundred pages, they must, in the mean time, be postponed.\*

\* A work, embracing illustrations of some of the topics here stated, is preparing for the press, under the title of "*The Philosophy of Religion; or, an illustration of the Moral Laws of the Universe, on the principles of Reason and Divine Revelation.*" In this work, an original, and, at the same time, a popular train of thought will be prosecuted, and the different topics will be enlivened with illustrative facts, borrowed from the scenery of nature and the moral history of mankind.

## CHAPTER V.

### BENEFICIAL EFFECTS WHICH MIGHT RESULT TO CHRISTIAN SOCIETY FROM CONNECTING THE DISCOVERIES OF SCIENCE WITH THE OBJECTS OF RELIGION.

I.—THE VARIETY OF TOPICS which would be introduced into Christian instructions, by connecting them with the manifestations of Deity in the system of nature, WOULD HAVE A TENDENCY TO ALLURE THE ATTENTION OF THE YOUNG TO RELIGIOUS SUBJECTS, and to afford mental entertainment and moral instruction to intelligent minds of every description.

NOVELTY and variety appear to be essentially requisite in order to rouse the attention, not only of the more ignorant, but even of the more intelligent class of mankind, and to excite them to make progress in the path of intellectual and moral improvement. The principle of curiosity, which appears at a very early period of life, and which variegated scenery and novel objects tend to stimulate and to gratify—so far from being checked and decried, in a religious point of view, as some have been disposed to do, ought to be encouraged and cultivated in the minds both of the old and of the young. As it is a principle which God himself has implanted in our natures, for wise and important purposes, it requires only to be chastened, and directed in a proper channel, in order to become one of the most powerful auxiliaries in the cause of religion, and of intellectual improvement. To gratify this principle, and to increase its activity, the Creator has adorned our globe with a combination of beauties and sublimities, strewed in endless variety over all its different regions. The hills and dales, the mountains and plains; the seas, the lakes, the rivers, the islands of every form and size which diversify the surface of the ocean; the bays, the gulfs, and peninsulas; the forests, the groves, the deep dells, and towering cliffs; the infinite variety of trees,

plants, flowers, and vegetable productions of every hue, so profusely scattered over the face of nature; the diversified productions of the mineral kingdom; the variegated colouring spread over the face of nature; together with the many thousands of different species of animated beings which traverse the air, the waters, and the earth—afford so many stimuli to rouse this principle into exercise, and to direct the mind to the contemplation of the Creator. And as the earth displays an endless diversity of objects, so the heavens, in so far as they have been explored, exhibit a scenery both grand and variegated. There is not a planet in the solar system but differs from another, in its magnitude, in its distance from the central luminary about which it revolves, in the velocity of its motion, in the extent of the circle it describes around the sun, in the period of time in which its revolution is completed, in its rotation round its axis, in the number of moons with which it is attended, in the inclination of its axis to the plane of its orbit, and the diversity of seasons which results from this circumstance; in the density of its atmosphere, and the various appearances which diversify its surface. And if we were favoured with a nearer view of these majestic orbs, we should, doubtless, behold a similar variety in every part of their internal arrangements. The surface of the moon presents a variegated prospect of mountains and vales, but so very different is their form, position, and arrangement, from what obtains on the surface of our globe, that it would exhibit a scenery altogether new and uncommon to an inhabitant of this world, were he placed on the surface of that planet. Every comet, too, is distinguished from another, by its magnitude, the extent of its atmosphere, the

length of its blazing tail, the rapidity of its motion, and the figure of the curve it describes around the sun. With regard to the fixed stars, which are distributed, of every size, and in every direction, through the immensity of space, our senses, as well as the declaration of an inspired writer, convince us, that, in point of brilliancy, colour, and magnitude, "one star differeth from another star in glory."

And as the system of nature in all its parts presents a boundless variety of scenery, to arouse the attention, and to gratify the desire for novelty, so the revelation of God contained in the Sacred Records displays a diversified combination of the most sublime and interesting subjects and events. Were we to form an opinion of the compass of divine revelation, from the range of subjects to which the minds of some professing Christians are confined, it might all be comprehended within the limits of five or six chapters of the New Testament; and all the rest might be thrown aside, as a dead-weight upon the Christian system. But here, as in all the other displays of the Almighty, divine perfection and providence are exhibited in the most diversified aspects. Here we have recorded a history of the creation and arrangement of our globe,—of the formation of the first human pair,—of their primeval innocence, temptation, and fall,—of the arts which were cultivated in the first ages of the world,—of the increase of human wickedness,—of the building of the ark,—of the drowning of the world by a universal deluge,—of the burning of Sodom by fire from the clouds,—of the origin of languages,—of the dividing of the Red sea,—of the journeying of the tribes of Israel through the deserts of Arabia,—of their conquest of the promised land, and their wars with the nations of Canaan,—of the corporeal translation of Elijah from earth to heaven,—of the manifestation of the son of God in human flesh, the benevolent miracles he performed, and the triumphs he obtained over all the powers of hell and earth. We are here presented with the most interesting and affecting narratives, elegies, dramatic poems, and triumphal songs,—with views of society in the earliest ages of the world, when the lives of men were prolonged to nearly a thousand years,—with splendid miracles performed in the land of Egypt, in the wilderness of Horeb, and in the "field of Zoan," when "the sun and moon stood still in their habitation;" when the waters of the great deep were divided, and mountains shook and trembled "at the presence of Jehovah,"—with the glorious marching of a whole nation through the Arabian deserts, under the guidance of a miraculous pillar of cloud and fire,—with the visits of celestial messengers, and the visible symbols of "a present Deity,"—with prophetic delineations of the present and future condition of the race of Adam,—with descriptions of the power, wisdom, love, and

majesty of the Almighty, and of his operations in heaven and earth,—with the results and bearing of the economy of redemption,—with divine songs, odes, and hymns, composed by angels and inspired men,—with maxims of moral wisdom, examples of sublime eloquence, of strength of reasoning, and of manly boldness of reproof,—with proverbs, parables, allegories, exhortations, promises, threatenings, and consolatory addresses. In short, we have here detailed, in the greatest variety, history, antiquities, voyages, travels, philosophy, geography, natural and moral science, biography, arts, epic poetry, epistles, memoirs, delineations of nature, sketches of human character, moral precepts, prophecies, miracles, narrations, wonderful providences, marvellous deliverances, the phenomena of the air, the waters, and the earth; the past, the present, and the future scenes of the world—all blended together in one harmonious system, without artificial order, but with a majesty and grandeur corresponding to the style of the other works of God,—and all calculated to gratify the principle of curiosity—to convey "reproof, correction, and instruction in righteousness," and "to make the man of God perfect, and thoroughly furnished to every good work."

And, as the scenes of nature, and the scenes of revelation, are thus wonderfully diversified, in order to excite the attention of intelligent beings, and to gratify the desire for variety, so we have every reason to believe, that the scenes, objects, and dispensations, which will be displayed in the heavenly world, will be incomparably more grand and diversified. When we consider the immensity of God's universal kingdom, and the numerous systems, and worlds, and beings comprehended within its vast circumference, and that the energies of creating power may be for ever exerted in raising new worlds into existence—we may rest assured, that the desire of variety and of novelty, in holy intelligences, will be completely gratified throughout an endless succession of existence; and that the most luxuriant imagination, in its boldest excursions, can never go beyond the reality of those scenes of diversified grandeur which the heaven of heavens will display.

Now, since the book of nature, and the book of revelation, since all the manifestations of the Creator in heaven and earth, are characterized by their sublime and diversified aspect; we would ask, why should we not be imitators of God, in displaying the diversified grandeur of his kingdom of providence and of grace, before the minds of those whom we profess to instruct? Why should we confine our views to a few points in the Christian system, to a few stones in the fabric of the divine operations, when "a wide and unbounded prospect lies before us?" Why should we not rather attempt to rouse the moral and intellectual energies of mankind, from the

press, in the school-room, and in the family circle, by exhibiting the boundless variety of aspect which the revelations of heaven present, and the holy tendencies of devout contemplation on the works and the ways of God? that they may learn, with intelligence, to "meditate on all the works of the Lord, and to talk of all his doings." By enlarging and diversifying the topics of religious discussion, according to the views now stated, we have it in our power to spread out an intellectual feast to allure and to gratify every variety of taste,—the young and the old, the learned and the unlearned; yea, even the careless and the ignorant, the skeptical and the dissipated, might frequently be allured by the selection of a judicious variety of striking and impressive objects and descriptions, to partake of those mental enjoyments which might ultimately issue in the happiest results. The man of an inquisitive turn of mind, who now throws aside every thing that has the appearance of religion, on account of its dulness, might have his curiosity gratified amidst such a variety as that to which I allude; and, from perceiving the bearing of every discussion on the great realities of religion and a future state, might be led to more serious inquiries after the path that leads to immortality. In a word, to associate and to amalgamate, as it were, the arts and sciences, and every department of useful knowledge, with divine subjects, is to consecrate them to their original and legitimate ends, and to present religion to the eyes of men, in its most sublime, and comprehensive, and attractive form, corresponding to what appears to be the design of the Creator, in all the manifestations he has given of himself, in the system of nature, in the operations of Providence, and in the economy of redemption.

**II.—By connecting science with religion, Christians would be enabled to take AN EXTENSIVE SURVEY OF THE KINGDOM OF GOD.**

How very narrow and limited are the views of most professors of religion respecting the universal kingdom of Jehovah, and the range of his operations! The views of some individuals are confined chiefly within the limits of their own parish, or at farthest, extend only to the blue mountains that skirt their horizon, and form the boundary of their sight. Within this narrow circle, all their ideas of God, of religion, and of the relations of intelligent beings to each other, are chiefly confined. There are others, who form an extensive class of our population, whose ideas are confined nearly to the county in which they reside, and to the adjacent districts; and there are few, comparatively, whose views extend beyond the confines of the kingdom to which they belong—though the whole island in which we reside is less than the two-thousandth

part of the globe we inhabit. Of the vast extent of this earthly ball, of its figure and motions of its continents, seas, islands, and oceans, of its volcanoes and ranges of mountains, of its numerous and diversified climates and landscapes; of the various nations and tribes of mankind that people its surface, and of the moral government of God respecting them,—they are almost as completely ignorant as the untutored Greenlander, or the roving savage. With regard to the objects which lie beyond the boundary of our world, they have no precise and definite conceptions. When the moon is "walking in brightness" through the heavens, they take the advantage of her light to prosecute their journeys; and, when the sky is overcast with clouds, and they are anxious to travel a few miles to their destined homes, they will lift up their eyes to the heavens to see if any of the stars are twinkling through the gloom, that their footsteps may be directed by their glimmering rays. Beyond this they seldom soar. What may be the nature of the vast assemblage of shining points which adorn the canopy of their habitation, and the ends they are destined to accomplish in the plan of the Creator's operations, they consider as no part of their province to inquire.

"Their minds, fair science never taught to stray  
Far as the solar worlds, or milky way."

How very different, in point of variety, of grandeur, and of extent, are the views of the man who connects all the different departments of knowledge, and the discoveries of science with his prospects of God's universal dominion and government? With his mental eye he can traverse the different regions of the earth, and penetrate into the most distant and retired recesses where human beings have their residence. —He can contemplate and adore the conduct of divine sovereignty, in leaving so many nations to grope amidst the darkness of heathen idolatry,—he can trace the beams of the Sun of righteousness, as they gradually rise to illumine the benighted tribes of men,—he can direct his prayers, with intelligence and fervour, in behalf of particular kindreds and people,—he can devise, with judgment and discrimination, schemes for carrying the "Salvation of God" into effect,—he can realize, in some measure, to his mental sight, the glorious and happy scenes which will be displayed in the future ages of time, when "the kingdoms of this world shall become the kingdom of our Lord, and of his Christ," and when the "everlasting gospel" shall be published, and its blessings distributed among all who dwell upon the face of the earth. He can bound from this earth to the planetary worlds and survey far more spacious globes, peopled with a higher order of intelligences, arranged and superintended by the same Almighty Sovereign, who "doth according to his will among

the inhabitants of the earth." He can wing his way beyond the visible region of the sky, till he find himself surrounded on every hand with suns and systems of worlds, rising to view in boundless perspective, throughout the tracts of immensity—diversified with scenes of magnificence, and with beings of every order—all under the government and the wise direction of Him who "rules among the armies of heaven," and who "preserveth them all," and whom the "host of heaven worship" and adore. He can soar beyond them all to the throne of God, where angels and archangels, cherubim and seraphim, celebrate the praises of their Sovereign Lord, and stand ready to announce his will, by their rapid flight to the most distant provinces of his empire. He can descend from that lofty eminence to this terrestrial world, allotted for his temporary abode, and survey another unbounded province of the empire of God, in those living worlds which lie hid from the unassisted sight, and which the microscope alone can descry. He can here perceive the same Hand and Intelligence which direct the rolling worlds above, and marshal all the angelic tribes—organizing, arranging, and governing the countless myriads of animated existence which people the surface of a muddy pool. He can speed his course from one of these departments of Jehovah's kingdom to another, till, astonished and overwhelmed with the order, the grandeur, and extent of the wondrous scene, he is constrained to exclaim, "Great and marvellous are thy works, Lord God Almighty!" "Thine understanding is infinite!" The limits of thy dominions are "past finding out!"

By taking such extensive surveys of the empire of Jehovah, we are enabled to perceive the spirit and references of those sublime passages in the sacred writings which proclaim the majesty of God, and the glory of his kingdom. Such passages are diffusely scattered through the inspired volume, and have evidently an extent of reference far beyond what is generally conceived by the great mass of the Christian world. The following may suffice as a specimen:—

"Thine, O Lord! is the greatness, and the glory, and the majesty; for all in heaven and earth is thine! Thine is the kingdom, O Lord! Thou art exalted above all, thou reignest over all, and in thine hand is power and might.—Behold, the heaven, and the heaven of heavens, is the Lord's; the earth also, with all that therein is.—Ascribe ye greatness to our God; for there is none like unto the God of Israel, who rideth upon the heavens in his strength, and in his excellency on the sky. Thou, even thou, art Lord alone; thou hast made heaven, the heaven of heavens, with all their host; the earth, and all things that are therein; the sea, and all that is therein; and thou preservest them all, and the host of heaven worshippeth thee.—He divideth the sea by his power; by his Spirit he hath garnished the

heavens: Lo! these are only parts of his ways; but how little a portion is heard of him, and the thunder of his power who can understand?—The Lord hath prepared his throne in the heavens, and his kingdom ruleth over all.—O Lord our God! how excellent is thy name in all the earth! who hast set thy glory above the heavens. When I consider thy heavens, the work of thy fingers, the moon and the stars, which thou hast ordained; what is man, that thou art mindful of him!—His kingdom is an everlasting kingdom, honour and majesty are before him; *all the inhabitants of the earth are reputed as nothing in his sight*, and he doth according to his will in the army of heaven, and among the inhabitants of the earth.—He measures the waters in the hollow of his hand; he meteth out heaven with a span, and comprehendeth the dust of the earth in a measure.—He sitteth upon the circle of the earth, and the inhabitants thereof are as grasshoppers.—I have made the earth, and created man upon it; I, even my hands, have stretched out the heavens, and all their host have I commanded.—The Most High dwelleth not in temples made with hands; for the heaven is his throne, and the earth is his footstool.—With God is awful majesty.—Great things doth He, which we cannot comprehend; yea, the Lord sitteth King for ever.—Praise ye the Lord in the heavens; praise him in the heights; praise him, all his angels; praise ye him, all his hosts. Praise him, sun and moon; praise him, all ye stars of light; praise him, ye heaven of heavens. Praise him, ye kings of the earth, and all people, princes and judges of the earth; both young men and maidens; old men and children—let them praise the name of the Lord; for his name alone is excellent, his glory is above the earth and heaven."

These sublime descriptions of the supremacy of God, and of the grandeur of his kingdom, must convince every reflecting mind, of the inconceivable magnificence and extent of that dominion "which ruleth over all." It is quite evident, that we can never enter, with intelligence, into the full import and the grand references of such exalted language employed by inspired writers, unless we take into view all the discoveries which science has made, both in the earth and in the heavens, respecting the variety and extent of the dominions of the Creator. If the "kingdom of the most High" were as limited in its range as most Christians seem to conceive, such descriptions might be considered as mere hyperboles, or bombast, or extravagant declamation, which far exceeds the bounds of "truth and soberness." But we are certain, that the conceptions and the language of mortals can never go beyond the reality of what actually exists within the boundless precincts of Jehovah's empire. For "who can utter the mighty acts of the Lord?" or "who can show forth *all* his

praise?" The language and descriptions to which we have now adverted, seem to have had a prospective reference to later and more enlightened times, when more extensive prospects of God's dominions would be opened up by the exertions of human intellect. And were we to search the records of literature, in ancient or modern times, we should find no descriptions nor language of such dignified nature as to express the views and feelings of an enlightened Christian philosopher, when he contemplates the sublimity and extent of divine operations—except those which are to be found in the inspired volume—the strength, and majesty, and comprehension of which no human language can ever exceed.

Again, by familiarizing our minds to such extended prospects of God's universal kingdom, we shall be qualified and disposed to comply with the injunctions of Scripture, which represent it as an imperious duty, *to communicate to the minds of others such elevated conceptions*. This duty is enjoined in numerous passages of Sacred Scripture, particularly in the book of Psalms: "Declare his glory among the heathen, and his wonders among all people.—I will extol thee, my God, O King.—One generation shall praise thy works to another, and shall declare thy mighty acts.—I will speak of the glorious honour of thy majesty, and of thy wondrous works. And men shall speak of the might of thy terrible acts; and shall declare thy greatness. All thy works shall praise thee, O Lord; and thy saints shall bless thee. *They shall speak of the glory of thy kingdom, and talk of thy power; to make known to the sons of men thy mighty acts, and the glorious majesty of thy kingdom.*"\* When we look around us in the world, and in the visible church, and mark the conceptions and the conversation of the members of religious societies, we need scarcely say how little this ennobling duty is attended to by the mass of those who bear the Christian name. We hear abundance of idle chat about the fashions and the politics of the day—how Miss A. danced so gracefully at the ball, and how Miss B. sung so sweetly at the concert; how Mr. C. acted his part so well in the character of Rob Roy, and how Mr. D. made such a flaming speech at the corporation dinner. We listen to slanderous conversation, and hear abundance of mean, and base, and uncharitable insinuations against our neighbours; which indicate the operation of malice, hatred, envy, and other malevolent tempers. We spend whole hours in boisterous disputations about metaphysical subtleties in religion, and questions "which gender strife rather than godly edifying;" but "to speak of the glory of God's kingdom, and to talk of his power," with the view of "making known to the sons of men his mighty works," is a duty which remains yet to be learned by a ma-

jority of those who profess the religion of Jesus. And how can they be supposed to be qualified to enter into the spirit of this duty, and to proclaim to others "the glorious majesty of God's kingdom," unless such subjects be illustrated in *minute detail*, and proclaimed with becoming energy, both from the pulpit and from the press? These powerful engines, when conducted with judgment and discrimination, are capable of producing on the mass of mankind a tone of thinking, and an enlargement of conception, on such subjects, which no other means can easily effect; and it is to be hoped, that more precise and luminous details, and more vigour and animation, will soon be displayed, in this respect, than in the ages that are past.

There is a certain principle of *selfishness* which pervades the minds of many professed religionists, which leads them to conclude, that, if they can but secure their own *personal salvation*, they need give themselves no trouble about the glory and extent of the kingdom of the Most High. "What need we care," say they, "about nations in the far-distant parts of the world, and about the planets and the stars; our business is to attend to the spiritual interests of our souls." Such persons seem neither to understand in what salvation really consists, and what is conducive to their spiritual interests, nor to appreciate those tempers and habits which will qualify them for the enjoyment of eternal life. It forms but a very slender evidence of their possessing any spark of Christianity at all, if they wish to rest satisfied with the most vague and grovelling conceptions, and if they do not ardently aspire after a more enlarged view of the attributes of God, of the glory of his empire, and of whatever may tend to expand their conceptions of "the inheritance of the saints in light." We have often been astonished at the opinions of some of those who move in a higher sphere of intelligence, who seem to consider it as a matter of *pure indifference*, whether or not Christians should attain to the highest conception in their power of the God whom they worship, and of his boundless dominions; because they conceive that such views are not essentially connected with salvation? Though they may not have been essential to the salvation of men in the dark ages that are past, or to obscure tribes of people at present, who have no access to the proper sources of information, yet, since God, in the course of his providence, which guides all human inventions and discoveries, has disclosed to us a far more expansive view of the "glory of his kingdom," than former ages could obtain, for the purpose of illustrating the revelations of his word—who will dare to assert, that the man who has access, by his studious efforts, to contemplate this wondrous scene, and to display its grandeur to others, and yet wilfully shuts his eyes on the divine glory therein displayed, does not thereby hazard the

\* Psalm cxlv. and cxvi. 2, 4

divine displeasure? In this point of view, the following passage deserves a serious consideration: "Because they regard not the works of the Lord, nor the operations of his hands, he shall destroy them, and not build them up." We have no hesitation in admitting, that persons may have obtained salvation who never saw more of the sacred writings than what is contained in the gospel of Mark, or in one of Paul's epistles; but what would we say of the man who had access to all the revelations of heaven we now possess, and yet confined his attention solely to a chapter or two in the New Testament, and would not deign to look into any other part of the inspired volume? We should not hesitate at once to pronounce that such a person was grossly deficient in his duty, and devoid of that reverence and submission which are due to the oracles of God. And, if it be admitted, that the person who has access to the bible, and who refuses to peruse its important contents, is guilty of a criminal neglect, we do not see how the man, who has free access to the other volume of God's revelation, and views it as a matter of mere indifference whether he looks into it or not, can be deemed, in this respect, entirely innocent. If it be understood, that we shall be judged according to the light and privileges we enjoy, and the use we make of them, in our improvement in the knowledge of God—we would deem it a hazardous position for any one to support, that "inattention to the visible glories of the kingdom of God, and to the 'declaration of his wonders among the people,' is a matter either of indifference or of trivial importance."

For, let it be considered, further—that on the extent of our views respecting the universal kingdom of God depends our conceptions of the majesty and glory of the Creator himself. We become acquainted with the nature of God, only in so far as he has manifested himself to us by external operations,\* and in so far as we form just conceptions of these operations. If we conceive his empire as included within the bounds of eighty or ninety thousand miles, our conceptions of the Sovereign of that empire will be circumscribed within nearly the same limits. The mind of every reasonable man must, indeed, admit the abstract proposition, "That the Divine Being is infinite, and, consequently, fills all space with his presence." But this infinity, in our view, is nothing more than a vague conception of empty space, extending a little way beyond the sphere of his visible operations. The mind must have some material, visible, or tangible objects to rest upon, and to guide it in its excursions, when it would attempt to form the most definite and comprehensive conceptions of an infinite, eternal, and invisible existence. For however much we

may talk about purely spiritual ideas, it is quite evident, from the nature of things, and from the very constitution of man, that we can have no ideas at all without the intervention of sensible objects. And, therefore, if we would wish to form the most sublime conceptions of God himself, we must endeavour, in the first place, to take the most extensive views which science and revelation exhibit, of his vast dominions. We must endeavour to form some adequate idea of the wide extent of the globe on which we dwell, its diversified scenery, and the numerous tribes of human beings, and other animated existences, visible and invisible, which people its different provinces. We must explore the vast regions of the planetary system, and compare the bulk of the earth, large as it is, with some of those more magnificent globes, which would contain a thousand worlds as large as ours. We must next wing our way, in imagination, over a space which a cannon-ball, flying five hundred miles every hour, would not traverse in ten hundred thousand years, till we arrive at the nearest fixed stars, and find ourselves in the centre of thousands of systems and worlds, arranged at immeasurable distances from one another. We must pass from one nebula, or cluster of systems, to another; continuing our excursions as far as the eye or the telescope can direct our view; and, when the aid of artificial instruments begins to fail, our imagination must still take its flight far beyond the boundaries of mortal vision, and add system to system, and nebula to nebula, through the boundless regions of space, till we arrive at the grand centre of the universe, the throne of God, around which all worlds and beings revolve, where "thousands thousands" of bright intelligences "minister to Him, and ten thousand times ten thousand stand before him." We must consider all this magnificent assemblage of objects, not merely as so many masses of inert matter, or as a grand raree-show, to dazzle the eyes of a few hundreds of human spectators,—but as destined for purposes worthy of the plans and the intelligence of Him who is "the only wise God,"—as peopled with numerous orders of intelligent beings, whose physical and moral economy is superintended and directed by Him, who, at the same time, rules amidst the tumults of human revolutions, and governs the living myriads which people a drop of water.

In this way, then, do we come to acquire the most extensive views of the amplitude and glory of the kingdom of the Most High; and it is only by the same process of thought that we can ever attain the most exalted conceptions of the attributes of its almighty Sovereign. For our views of the Sovereign of the universe must always correspond with our views of the extent and magnificence of those dominions which sprung from his creating hand, and over which he every moment presides. His essence must for ever remain im-

\* Here I include the manifestations of Deity, as exhibited both in divine revelation, and in the system of nature.

perceptible to finite minds ; for he is " the King eternal, immortal, and invisible, dwelling in that light which no man can approach unto, whom no man hath seen, or can see." From his nature, as a spiritual uncompounded substance, and from his immensity, as filling infinite space with his presence, it appears impossible, in the very nature of things, that the glory of his perfections can be displayed in any other way than through the medium of the visible operations of his hands, or in the dispensations of his providence towards particular worlds or classes of intelligences. And if, in the future world, the souls of good men will enjoy a more glorious display than at present, of the attributes of Deity, it will be owing chiefly to their being placed in more favourable circumstances than they now are, for contemplating this display ; to their faculties being more invigorated ; and every physical and moral impediment to their exercise being completely removed ; so as to enable them to perceive more clearly than they now do, the unbounded displays he has given of his power, wisdom, and benevolence. And, if we expect to be introduced to this state of enlarged vision, when we pass from the scenes of mortality, it cannot be a matter of mere indifference, even now, whether or not our minds are prepared for such exalted employments, by endeavouring to form the most ample conceptions of the attributes of God which can be obtained through the medium of his word, and by a contemplation of the variety and magnificence of his works. In the prospect of that world where we hope to spend an interminable existence, it must also be interesting to ascertain, whether or not the dominions of the universal Sovereign present such an extent of empire, and such a variety of objects, that new scenes of wonder and glory may be expected to be displayed in continual succession, for the contemplation and entertainment of holy beings, while eternal ages are rolling on. And, on this point, the discoveries of science confirm and illustrate the notices of heavenly glory and felicity recorded in the inspired volume, and lead us to rest with full assurance on the prophetic declaration, that " eye hath not seen, nor ear heard, nor hath it entered into the heart of man to conceive, the things which God hath prepared for them that love him."

III.—*By connecting the discoveries of science with religion, the minds of Christians would be enabled to take a more minute and comprehensive survey of the OPERATIONS OF PROVIDENCE.*

Providence is that superintendence and care which God exercises over all creatures and events, in order to accomplish the eternal purposes of his will. In creation, God brought the universe out of nothing, and arranged all its provinces and inhabitants in due order. By his providence he supports and governs all the

movements of the material system, and the sensitive and rational beings with which it is peopled. It is evident, that, in proportion as our views of the Creator's dominions are extended, our views of his providence will, to a certain extent, be proportionably enlarged. For wherever worlds and beings exist, there will God be found, preserving, superintending, and governing the movements of all creatures and events. It is chiefly, however, in the world in which we reside, that the diversified dispensations of Providence can be distinctly traced. Now an acquaintance with the prominent parts of the different branches of knowledge to which I have already adverted, would enable us to take a particular and comprehensive view, not only of the ways of God to man, but also of his arrangements in reference to all subordinate creatures and events.

From the inspired history of the Old Testament, we can trace the prominent lines of the dispensations of God towards man, particularly in regard to the Israelites and the surrounding nations—from the creation to a period about 400 years before the coming of Christ. But in order to perceive the farther progress and bearings of these lines till the commencement of the New Testament economy, we must have recourse to the most authentic records of profane history. From the era of the birth of Christ to near the close of the first century, we can acquire, from the evangelists and the history of the apostles, a particular account of the life of Christ, of the events which preceded and accompanied the finishing of the work of redemption, and of the progress of the gospel through Judea and the adjacent countries. But after this period we have no inspired guide to direct us in tracing the divine dispensations towards the various nations of the earth ; and, therefore, we must have recourse to the annals, memoirs, chronicles, and other records of the history of nations, down to the period in which we live ; otherwise we could never contemplate the continued series of events in the divine economy towards the inhabitants of our world. Unless men of learning and of observation had recorded the prominent facts which have occurred in the history of nations, for 1700 years past, we must have remained almost as ignorant of the dispensations of God towards our race, during that period, as the inhabitants of the planet Saturn : and unless we study the events thus recorded in the writings of the historian, and contemplate their varied aspects and bearings in the light of divine revelation, we must still remain ignorant of the grand movements and tendencies of divine providence. This single circumstance shows, in the clearest light, that it is the intention of God, that we should learn the operations of his providence from the researches of science and history, as well as from the records of revelation ; and that the scriptures, though they contain every supernatural discovery requisite to

our happiness, are not of themselves sufficient to present us with a connected view of the prominent dispensations of heaven, from the creation to the period in which we live.

From the science of *geography* we acquire a knowledge of the extent of the surface of the earth—of the various tribes of human inhabitants with which it is peopled—of the physical aspect of the different climates they inhabit—of their arts, manners, customs, laws, religion, vices, wars, and political economy: and, consequently, we can, in these and similar respects, trace some of the aspects of Divine Providence towards them in relation to their present and future condition. From the same source, we learn the number of human beings which the Governor of the world has under his direction at one time, which is nearly a thousand millions, or five hundred times the number of the inhabitants of Scotland. From the data afforded by this science, we may also form an estimate of the number of disembodied spirits that have passed from this world since the creation, and are now under the superintendence of the Almighty in the invisible state, which cannot be much less than 145,000 millions; and on similar grounds we may also learn the number of rational beings that are coming forward into existence, and passing into the eternal world every day, which is at least 88,000, and, consequently, nearly 80 during each passing minute,—every individual of which, the Supreme Disposer of events superintends at his entrance into life; and, at his departure from it, directs to his respective and eternal state of destination. All which circumstances, and many others of a similar kind, must be taken into account, in order to our forming a comprehensive conception of the numerous bearings and the incessant agency of a Superintending Providence.

From *natural history* we learn the immense number and variety of the subordinate tribes of animated beings which inhabit the different regions of earth, air, and sea—their economy and instincts—their modes of existence, and the manner in which the Creator provides for their various necessities. From an acquaintance with the *history of the arts and mechanical inventions*, we learn the gradual manner in which God directs the movements of the human mind, in making those improvements and discoveries which have a bearing upon the accomplishment of his eternal plans of mercy, and which tend to enlarge our views of the amplitude and the glories of his kingdom. From *natural philosophy* and *chemistry*, we learn the secondary causes or subordinate laws by which the Almighty supports and directs the natural constitution of the world—the wonderful manner in which our lives are every moment supported—and the agencies by which fire, air, light, heat, and fertility are distributed through the globe, for promoting the comfort and happiness “of every thing that

lives.” From *anatomy* and *physiology*, we learn, how “fearfully and wonderfully we are made and preserved”—that our health and comfort depend upon the regular action of a thousand organical parts and functions, over which we have no control—and that our very existence every moment is dependent on the superintendence of a Superior Power, “in whose hand our breath is, and whose are all our ways.”

By an occasional study, then, of the subjects to which we have now alluded, we would gradually expand our conceptions of the range and operations of Divine Providence. Every geographical exploration of a new region of the globe—every scientific improvement and discovery—every useful invention—every eruption of a volcano—every shock of an earthquake—every hurricane, and storm, and tempest—every battle of the warrior—every revolution among the nations—and every detail in the newspapers we daily read, would lead us to form some conceptions of the providential purposes of Him who is the Supreme Disposer of all events.—Even the arrangements of Divine Wisdom, with regard to the economy of the lower animals, ought not to be overlooked in such a survey. When we consider the immense number and variety of animated beings—that there are 500 species of quadrupeds, every species containing, perhaps, many millions of individuals; 4000 species of birds; 2500 species of fishes; 700 species of reptiles; and 44,000 different kinds of insects, besides many thousands of species altogether invisible to the unassisted sight—when we consider that the structure and organization of all these different species are different from each other, and exactly adapted to their various situations and modes of existence, and that their multifarious wants, in regard to food and habitation, are all provided for, and amply supplied by Him, who, at the same time, arranges and governs the affairs of ten thousand worlds—we must be lost in astonishment at the greatness of that Intelligence which formed them, and at the exuberance of that Bounty which spreads so full a table for so immense an assemblage of living beings! And were we transported to other worlds, we should, doubtless, behold still more ample displays of Divine Beneficence.

We are here presented, with a striking commentary on such passages of the sacred volume as these: “The eyes of all look unto Thee, O Lord! and thou givest them their meat in due season. Thou openest thy hand liberally, and satisfiest the desire of every living thing. The earth is full of thy riches, O Lord! so is the great and wide sea, wherein are things creeping innumerable, both great and small beasts. These all wait upon thee, and thou givest them their meat in due season. That which thou givest them they gather: Thou openest thy hand, they are

filled with good."—"O Lord, thou preservest man and beast! How excellent is thy loving-kindness! Therefore the children of men shall put their trust under the shadow of thy wings: They shall be abundantly satisfied with the fatness of thy house,"\* (of the table thou hast spread in thy world for all thine offspring,) "and thou shalt make them drink of the river of thy pleasures." One excellent practical effect which might flow from such contemplations would be, to inspire us with feelings of humanity towards the inferior order of animals, and to prevent us from wantonly and unnecessarily torturing, or depriving them of existence. For since the Creator and Preserver of all has so curiously organized their bodies, and fitted them for the different regions in which they reside, and so carefully provided for all their wants, it must be His will that they should enjoy happiness according to the extent of their capacities; and, therefore, they ought to be considered as necessary parts of our sublunary system. Another practical lesson we may derive from such surveys, is, to place an unshaken dependence upon God for our temporal subsistence, while we, at the same time, exert all our faculties in the line of active duty. "Blessed is the man who trusteth in him; for there is no want to them that fear him. The young lions may suffer hunger, but they that fear the Lord shall not want any good thing." He who decks the lily of the vale, and spreads out a plentiful table to the fowls of heaven, to the beasts of the forests, to the creeping insects, and even to the microscopic animalcules, will never fail to supply the necessary wants of those who "do His will, and hearken to the voice of his commandments." And if, at any time, we be found destitute of daily food, and pining away in penury and squalid disease, we have too much reason to conclude, that in one way or another, either our deviation from the path of rectitude, or our distrust of divine providence, or our want of prudence and economy, has procured for us these things.

I have said, that it is chiefly in the world in which we dwell, that the dispensations of Providence can be distinctly traced. But we must nevertheless admit that the care and superintendence of God are as minutely exercised in the distant regions of the universe as in our terrestrial sphere; though we are not permitted, at present, to inspect the particular details of His

\* This, and several other similar passages, may be considered as more especially applicable to the bounty of providence which God has provided for all his creatures. The practice of *spiritualizing* such passages, as it is termed, has a tendency to caricature Scripture, and to twist it from its precise and sublime references, to accord with the vague fancies of injudicious minds. The literal meaning of Scripture is always the most appropriate, emphatic, and sublime; but it may, in some cases, be used by way of accommodation. In illustrating divine subjects, when it is applied with judgment and discrimination.

procedure in reference to other orders of intelligences. We are not, however, altogether ignorant of some prominent features of the physical and moral economy of other worlds, in consequence of the discoveries of modern astronomical science.

With respect to their *physical* economy, we behold a striking variety in the divine arrangements. We perceive one planetary world surrounded by two splendid and magnificent rings, one of them 204,000, and the other 184,000 miles in diameter, stretching across its celestial canopy from one end of the heavens to another—moving with majestic grandeur around its inhabitants every ten hours, and diffusing a light equal to several thousands of moons like ours—which may be considered as a visible and permanent emblem of the majesty and glory of their Creator. We perceive connected with the same globe, seven moons, all larger than ours, of different magnitudes, and placed at different distances, and revolving in different periods of time around that spacious world. The diversified aspects of these rings, as viewed from the different regions of the planet at different times, and the variety of appearances produced by the alternate rising and setting, culmination, and frequent eclipses, and other aspects of the moons, must present to the inhabitants a very grand and varied and magnificent scene of divine operation.\* On the other hand, we behold another planetary globe, destitute both of rings and moons, but which has the starry heavens presented to view nearly in the same aspect in which we behold them. We perceive a third globe much larger than them both, capable of containing 200 times the number of the inhabitants of our world—accompanied in its course with four moons to diffuse light in the absence of the sun, and to diversify the aspect of its sky. In some of these worlds, the succession of day and night is accomplished within the space of ten hours; in others, this revolution is not completed till after the lapse of twenty-four hours, or of as many days. In some, the days and nights are nearly equal on every part of their surface, and they have little variety of seasons; in others, the variety in the length of the days, and the vicissitudes of the seasons, are nearly the same as those we experience in our terrestrial world. Around some there appears a dense atmosphere, while others are environed with atmospheres more rare and transparent. Some move in the vicinity of the sun, and enjoy an abundant efflux of light and heat, while others are removed to the distance of eighteen hundred millions of miles from that central luminary. Some finish the revolution of their year in a few months; while others require twelve, thirty, or even eighty of our years to complete their annual round. Some appear

\* See the *plate*, Fig. 7

adorned with majestic mountain scenery, and others seem to have great changes occasionally taking place in their atmosphere, or on their surfaces. There are four planetary bodies lately discovered, which, there is every reason to believe, once formed the component parts of a large globe; but by some mighty catastrophe in the dispensations of heaven, it appears to have been burst asunder into the fragments we now behold. If the general proposition illustrated in section 2. of the preceding chapter be admitted, such a fact would seem to indicate that a moral revolution has taken place among the intelligent beings who had originally been placed in those regions; and that their fate was involved in the dreadful shock which burst asunder the globe they inhabited; just as the fate of the antediluvians was involved in the shock by which the solid crust of our globe was disrupted, at the period of the universal deluge.

These are some outlines in the economy of Providence which we can trace with regard to the arrangements of other worlds; but beyond such general aspects we are not permitted to penetrate, so long as we sojourn in tabernacles of clay. But even such general views afford some scope to the contemplative mind, for forming enlarged conceptions of the grandeur and diversity of the dispensations of God, in the worlds which roll in the distant regions of space.

With regard to their *moral economy*—we may rest assured that the prominent outlines of it are materially the same as of that economy which relates to the inhabitants of our world. The fundamental principles of the moral laws given to men, and which it is the great object of revelation to support and illustrate, are, “Thou shalt love the Lord thy God with all thy heart and understanding,” and, “Thou shalt love thy neighbour as thyself.” On these two commandments hang all the law and the prophets. Now, we must admit, from the nature of the Divine Being, and from the relations in which rational beings stand to Him and to one another, that the Creator has enacted these laws, as the great governing principles by which the actions of all intelligences in heaven, as well as upon earth, are to be directed. For the Governor of the world can never be supposed to issue a law to any order of rational creatures, which would permit them to hate their Creator, or to hate those whom he has formed after his own image. Such a supposition would be inconsistent with the eternal rules of rectitude, and with the perfections of Deity—and the fact supposed, (if it could exist,) would introduce confusion and misery throughout the whole intelligent universe. And, therefore, we must necessarily admit, that the laws to which I now advert, are binding upon all the rational inhabitants which exist throughout Jehovah’s dominions; and that it is by these that the moral order of all the principalities and powers of hea-

ven is preserved and directed. In those worlds where there is no change in the succession of their inhabitants—or, in other words, where there is no death, or where they are not produced by any process analogous to generation, but have a fixed and permanent residence, there will be no need for moral precepts corresponding to the fifth and the seventh commandments of our moral law; and in those worlds where property is common, and the bounties of the Creator are equally enjoyed by all, there will be no necessity for a law corresponding to the eighth commandment; but the general principles on which these laws are founded, will be applicable to all the other circumstances and relations which actually exist; so that the *principle*, and *spirit*, and *essence* of our religion must be common to all the holy inhabitants of the universe. And, therefore, it will follow, that every intelligent being that is animated and directed by such principles and affections, will be qualified for holding delightful intercourse with all holy beings throughout the universe of God, in whatever province of the Creator’s empire he may hereafter be placed; and, to qualify us for such harmonious and affectionate intercourse, is one great end of the salvation exhibited in the gospel. So that, although we cannot, in our present state, acquire a minute and comprehensive knowledge of the moral history of other worlds, of the special interpositions or manifestations of Deity in relation to them, or of the means by which they are carried forward in moral and intellectual improvement—yet we can trace the *general* principles or laws which form the basis of their moral and religious economy. For as the laws of optics, and the principle of gravitation, pervade the whole material system, as far as the universe is visible to our assisted vision, so the principle of supreme love to God, and sincere affection to fellow-intelligences, must pervade the *intellectual* universe, wherever it extends; and, if any intelligent agents besides men, have violated these laws, they must experience pain, and misery, and disorder, analogous to those which are felt by the inhabitants of our apostate world.

Thus I have endeavoured to show, that the combination of science with religion would tend to expand our views of divine providence—in the various arrangements of God, in relation to the human race, and to the subordinate tribes of sensitive beings—and in reference to some of the prominent features of his administration in distant worlds. And, therefore, though the Christian ought never to overlook the ways of Providence in relation to himself, and to his spiritual and domestic concerns, yet it would argue a selfishness and a sottishness altogether inconsistent with the noble and expansive spirit of Christianity, to overlook all the other parts of the theatre of divine dispensations, when a very slight degree of labour and research

might be instrumental in unfolding them to his view

**IV.—The connexion of science with religion would have a tendency to induce upon Christians A SPIRIT OF LIBERALITY, OF CANDOUR, and of ACCURACY IN JUDGING OF THE OPINIONS AND ACTIONS OF MEN, and of THE DIVINE PROCEDURE AND OPERATIONS.**

Who is the most candid and liberal Being in the Universe? God.—And why is God to be considered as the most liberal intelligence that exists? Because he embraces a minute, a full, and comprehensive view of all the circumstances, connexions, relations, habits, motives, temptations, modes of thinking, educational biases, physical affections, and other causes, that may influence the sentiments or the conduct of any of his creatures.—Who among created intelligences may be viewed as endowed with these qualities in the next degree? The loftiest seraph that God has created, who has winged his way to numerous worlds, and taken the most extensive survey of the dispensations of the Almighty, and of all creatures and events.—Who, among the sons of men, is the most illiberal and inaccurate in judging of opinions, of persons, and of things? The man who has lived all his days within the smoke of his father's chimney, or within the confines of his native village—who has never looked beyond the range of his own religious party—whose thoughts have always run in one narrow track—whose reading has been confined to two or three musty volumes, which have lain for ages on the same smoky shelf—who cares for nothing either in the heavens or the earth, but in so far as it ministers to his convenience, his avarice, or his sensual enjoyment—who will admit no sentiment to be true, but what he may have heard broached by his parson—and whose conversation seldom rises beyond mere gossiping chit-chat, and the slanderous remarks which are circulated among his neighbours.—Such characters are entirely unqualified for forming a correct judgment, either of the sentiments and the actions of men, or of the works and the ways of God; for they are completely destitute of the requisite *data* whereon to form a rational decision in relation to either of these subjects.

It may be admitted as a kind of axiom, in our estimate of human character, that in proportion to the ignorance and the narrow range of view which characterize any individual, in a similar proportion will be his want of candour and his unfitness for passing a sound judgment on any subject that is laid before him,—and that the man who has taken excursions through the widest range of thought, accompanied with a corresponding improvement of his moral powers, will always be the most liberal and candid in his de-

cisions on the moral and intellectual qualities of others. To these maxims few exceptions will generally be found.—In forming an enlightened judgment in regard to any action or object, it is essentially requisite, that we contemplate it in all its different features and aspects, and in all its minute circumstances, bearings, and relations. We would not hesitate for a moment to determine who is best qualified to give an accurate description of a city,—he who has only viewed its spires from a distance, while in rapid motion in his chariot—or he who has minutely surveyed all its streets, lanes, squares, public edifices, and surrounding scenery, in every variety of aspect; or, who appears most likely to form the most accurate and enlightened judgment in relation to any particular kingdom—he who has just skirted along a few miles on one of its coasts, or he who has traversed its length and breadth in all directions, and mingled with every class of its inhabitants. On the same principle, it must be admitted, that he who has viewed religion in all its aspects and bearings, who has taken the most extensive survey of the manifestations of God, and of the habits and relations of men, is the best qualified to pronounce a candid and accurate decision on all the intellectual and moral cases that may come before him.

If the spirit of the above stated sentiments be founded on reason and on fact, it will follow, that the more we resemble God in the amplitude of our intellectual views and benevolent affections, the more candid, and liberal, and accurate will our judgments be in reference to all the actions, objects, and relations we contemplate.—On the other hand, the man who is confined to a narrow range of thought and prospect is continually blundering in the estimates he forms, both in respect to physical facts, to general principles, and to moral actions. He forms a premature and uncharitable opinion on every slander and report against his neighbour. He condemns, without hesitation, and throws an unmerited odium on whole bodies of men, because one or two of their number may have displayed weakness or folly. He hates and despises men and their opinions, because they belong not to his political or religious party. He pronounces his decisions on the motives of men, with as much confidence as if he had surveyed their hearts with the eye of omniscience. He cannot bear an objection against his favourite opinions with patience, nor an apology for any set of opinions but his own. He is arrogant and dogmatical in his assertions, and will make no concessions to the superior wisdom of others. He sets himself, with violence, against every proposal for reformation in the church, because his forefathers never thought of it, and because such “innovations” do not suit his humour and preconceived opinions. He decides, in the most confident tone, on what God can and cannot do, as if he

and taken the gauge of infinite perfection ; and he frets at the divine dispensations when they do not exactly quadrate with his own humours and selfish views.

With regard to the operations of the Most High, he also forms the most foolish, and vague, and contradictory conceptions. Tell him of the vast dimensions of the planetary system, of the men and animals that live on the opposite side of the globe, of the annual and diurnal motion of the earth—that this world and its inhabitants are moving through the regions of space many thousands of miles every hour—that one of the planets is so large that it would contain 1400 worlds as spacious as ours—that another is flying through the tracts of immensity, at the rate of a hundred thousand miles in an hour—and that light is darted from the sun with a velocity of 195,000 miles in a moment of time—he will stare at you with astonishment at such extravagant assertions, and will sooner believe the stories of giants 100 feet high, and of fairies that can enter in crowds through the key-hole of his door. Instead of frankly acknowledging that “He is ignorant of such subjects, and of the grounds of such conclusions,—that those who have studied them with intelligence are best capable of judging,—that, if true, they must fill us with admiration of the glory of God,—but that, as he has hitherto had no opportunity of examining such matters, he must suspend his assent till he inquire into the reasons which can be given for such amazing deductions;”—instead of such concessions, which are the dictates of modesty and of common sense—he will tell you at once, without hesitation, and without a blush at his presumptuous decisions, that “it is all extravagance, and folly, and idle romance, contrary to Scripture, and reason, and common sense;” and will not hesitate to brand you as a heretic, for endeavouring to break loose his intellectual trammels!—thus tacitly declaring, that he is far better qualified to pronounce a decision on such topics, than all the philosophers and divines, and all the brightest geniuses who have appeared in the world for ages past; though he will at the same time admit, that he never gave himself the trouble to examine into such matters.

His views of the providential dispensations of God are equally partial and distorted. If disease, or poverty, or misfortune, happen to his neighbour, especially if he had withdrawn from the religious party to which he belongs, it is considered as a penal judgment for his error and apostacy. If prosperous circumstances attend his family or his religious party, it is viewed as a sign of divine approbation. He seldom views the hand of God, except in uncommon occurrences; and then, he imagines that a miracle is performed, and that the wheels of nature are stopped in order to accomplish the event. He

seldom looks beyond the precincts of his own church or nation, to observe the movements of the divine footsteps towards other tribes of his fallen race. He overlooks the traces of divine operation which are every moment to be seen above and around him—and yet, in the midst of all such partial and contracted views, he will sometimes decide on the wisdom and rectitude of the ways of God, with as much confidence, as if he had entered into the secret counsels of the Eternal, and surveyed the whole plan of his procedure.

Such are a few prominent outlines of the character of thousands whose names are enrolled as members of the visible church—whose illiberality and self-conceit are owing to the contracted notions they have formed of God and of religion. And, surely, it must appear desirable to every enlightened Christian, that all proper means should be used to prevent rational immortal beings from remaining enchained in such mental thralldom.

On the other hand, the man who takes an enlightened view of all the works and dispensations of God, and of all the circumstances and relations of subordinate beings, necessarily acquires a nobleness and liberality of mind, and an accuracy in judging of things human and divine, which no other person can possess. He does not hastily take up an evil report against his neighbour; for he considers how unfounded such reports often are, and how much they are owing to the insinuations of envy or of malice. And when he can no longer doubt of an evil action being substantiated against any one, he does not triumph over him in the language of execration; for he considers all the circumstances, relations, feelings, and temptations with which he may have been surrounded; he considers, that he himself is a frail sinful creature, and might possibly have fallen in a similar way, had he been placed in the same situation. He does not trumpet forth the praises of a man who has performed one brilliant benevolent deed, as if he were a character to be admired and eulogized—while the general course of his life is marked with vice, and an utter forgetfulness of God and religion; nor does he fix a stigma of immorality upon the person who may have acted foolishly or sinfully, in one or two instances, while the general tenor of his conduct has been marked by purity and rectitude: for, in both cases, he considers, that it is not an *insulated action*, but *general habits*, which determine the character of any individual. He esteems the wise and the good, and holds friendly intercourse with them, to whatever political or religious party they belong. He can bear, with affability and candour, to have his opinions contradicted, and can differ from his neighbour in many disputed points, while, at the same time, he values and esteems him. He will not brand a man as a heretic or a Deist.

because he takes a view of some dogmas in theology, in a different light from what he himself does; for he considers the difference of habits, studies, pursuits, and educational prejudices which must have influenced his opinions; and makes due allowance for the range of thought to which he may have been accustomed. He is always disposed to attribute the actions of others to good motives, when he has no proof of the contrary. He uses no threats nor physical force to support his opinions, or to convince gainsayers; for he knows that no external coercion can illuminate the mind, and that the strength of arguments, and the force of truth, can alone produce conviction. He is convinced how ignorant he is, notwithstanding all his study, observations, and researches; and presses forward, as long as he lives, to higher degrees of knowledge and of moral improvement.

He is an active promoter of every scheme that tends to enlighten and meliorate mankind, and to extend the knowledge of salvation to the ends of the earth; for he considers that it is not by *miracles*, but by the subordinate agency of intelligent beings, that God will effectuate the illumination and the moral renovation of our apostate race. He views the special agency of God in all the movements of the scientific, the religious, and the political world, and perceives Him accomplishing his purpose in the inventions of human genius, and in the economy of the minutest insect, as well as in the earthquake, the storm, and the convulsions of nations; for he considers the smallest atom, and the hosts of heaven, as equally directed by eternal wisdom, and equally necessary in the universal chain of creatures and events. He displays a becoming *modesty* in speaking of the ways and the works of God. When he meets with any dark and afflictive dispensation in the course of Providence, he does not fret and repine, but is calm and resigned, conscious that he perceives only a small portion of the chain of God's dispensations, and is, therefore, unable to form a just comparison of the connexion of any one part with the whole. When he contemplates the depraved and wretched condition of the greater part of the world, at present, and for thousands of years past, notwithstanding the salvation which has been achieved for sinners of mankind, he is far from arraigning the divine goodness and rectitude, in leaving so many nations "to walk in their own ways;" for he knows not what relation this dismal scene may bear, what influence it may have, or what important impressions it may produce, on worlds and beings with which we are at present unacquainted.

He is cautious in pronouncing decisively respecting the dispensations of God, in regard to the universe at large. He does not, for example, assert, with the utmost confidence, as some have done, "that there never was, and never will be,

to all the ages of eternity, such a bright display of the divine glory as in the cross of Christ." He admires and adores the condescension and the love of God, in the plan of salvation, which the gospel exhibits, and feels an interest in it far beyond that of any other special manifestation of Deity; but he dares not set limits to the divine attributes and operations. He considers himself at present, with regard to the grand system of the universe, in a situation similar to that of a small insect on one of the stones of a magnificent edifice, which sees only a few hair-breadths around it, and is altogether incapable of surveying the symmetry, the order, and beauty of the structure, and of forming an adequate conception of the whole. He considers that he has never yet surveyed the millionth part of Jehovah's empire, and therefore, cannot tell what the eternal Sovereign has been pleased to exhibit in its numerous provinces; and, least of all, can he ever presume to dive into the depths of interminable ages, and boldly declare what the Almighty will, or will not do, through eternity to come. He, therefore views it as presumption, while he has no dictate of revelation for his warrant, to pronounce decisively, either on the one side or the other, of such a deep and important question, which seems above the reach of the loftiest seraph to determine.\* In short, he endeavours to take a view of all the manifestations of Deity within his reach, from every source of information which lies before him, and as far as his limited faculties will permit. He does not call in question the discoveries of science, because they bring to his ears most astonishing reports of the wisdom and omnipotence of Jehovah, and of the boundless extent of his kingdom; but rejoices to learn, that the grandeur of his dominions is actually found to correspond with the lofty descriptions of divine majesty and glory recorded in the volume of inspiration, and is thereby inspired with nobler hopes of the glory and felicity of that heavenly world where he expects to spend an endless existence.

If, then, such be some of the features in the character of the enlightened Christian; if liberality and candour, and accurate investigation, mark the judgments he pronounces on the sentiments and the actions of men, and on the works and the ways of God; and if such views and feelings ought to be considered as more congenial to the noble and benevolent spirit of our religion, than the narrow and distorted notions of a contracted mind, it must be an object much to be desired, that the mass of the Christian world be led into such strains of thought, as might imbue their minds with a larger proportion of this spirit. And, if diversified and occasional discussions on the topics to which we have adverted would have a tendency to produce this desirable

\* See Appendix, No. X.

effect, it is obvious, that such branches of knowledge as are calculated to enlarge the capacity of the mind, and to throw a light over the revelations and the works of God, should no longer be overlooked in the range of our religious contemplations.

V.—*The extensive range of thought which the diversified objects in nature present, WOULD HAVE A TENDENCY TO INSPIRE US WITH A SPIRIT OF PIETY, AND OF PROFOUND HUMILITY.*

It is owing, in many instances, to want of attention to the impressive displays of wisdom and omnipotence in the material world, that our pious feelings and devotional exercises are so cold and languid. We stalk about on the surface of the earth, and pass from one day to another, without reflecting on the grand and complicated machinery around us, which is carrying us along through the regions of space, and from one portion of duration to another, as if the mighty energies of the Eternal Mind, exerted in our behalf, were unworthy of our acknowledgement or regard. How few, for example, reflect, when they open their eyes in the morning, and perceive the first beams of the rising sun, that since they lay down to sleep, the divine power has been exerted in carrying them more than four thousand miles round to the eastward, in order that they might again be cheered with the morning light; and that, during the same period, they, along with the earth and its vast population, have been carried forward 476,000 miles from that portion of space which they occupied seven hours before! Or, if they have no idea of the motion of the earth, and attach no belief to such an opinion, how is it they do not reflect, that after night has thrown its shades around them, the sun, and ten thousand other vast globes, must move several hundreds of millions of miles before their eyes can again behold the light of day? Either the one or the other of these cases *must be the fact*; and, in either case, there is presented to our view a display of the omnipotence and the superintendence of Him in whom we live and move, which demands our gratitude, our admiration, and praise. And can it ever be supposed, that such reflections, combined with all the other excitements to reverence and gratitude, will not tend to elevate our contemplations, and to raise our pious feelings to a higher pitch of devotion? Whether the psalmist entertained any views of this kind when he composed the ninety-second Psalm, we cannot certainly determine; but I presume, the pious and contemplative mind, when awaking from the slumbers of the night, under such impressions, might sing the first part of that song of praise with peculiar emphasis and delight—"It is a good thing to give thanks to Jehovah, and to sing praise to thy name, O thou Most High! to

show forth thy loving kindness in the morning. For thou, Lord, hast made me glad through thy work," (or thy powerful energy :) "I will triumph in the works of thy hands. O Lord! how great are thy works! and thy thoughts" (or contrivances) "are very deep! A brutish man knoweth not, neither doth a fool understand this."

An extensive acquaintance with nature and science, combined with Christian principle, would also induce *profound humility*. The man who has made excursions through the most diversified regions of thought, is deeply sensible of the little progress he has attained, and of the vast and unbounded field of divine science which still remains to be explored. When he considers the immense variety of sublime subjects which the volume of inspiration exhibits, and of which he has obtained but a very faint and imperfect glimpse—the comprehensive extent, and the intricate windings of the operations of Providence, and the infinite number of beings over which it extends—the amplitude and magnificence of that glorious universe over which Jehovah presides, and how small a portion of it lies open to his minute inspection—he is humbled in the dust at the view of his own insignificance; he sees himself to be a very babe in knowledge; and, as it were, just emerging from the gloom of ignorance into the first dawning of light and intelligence. He feels the full force and spirit of the poet's sentiments—

"Much learning shows how little mortals know."

When he considers the comprehensive extent of the divine law, and its numerous bearings on every part of his conduct, and on all the diversified relations in which he stands to his God, and to his fellow men; and when he reflects on his multiplied deviations from that eternal rule of rectitude, he is ashamed and confounded in the presence of the Holy One of Israel; and, on a review of his former pride and self-conceit, is constrained to adopt the language of Agur and of Asaph—"Surely I am more brutish than any man, and have not the understanding of a man. "So foolish was I, and ignorant, I was as a beast before thee." He views the meanest and the most ignorant of his species, as but a very few degrees below him in the scale of intelligence, and sees no reason why he should glory over his fellows.

This sentiment might be illustrated from the example of some of the most eminent men, in whose minds science and religion were combined. The Honourable Mr. *Boyle* was the most unwearied and successful explorer of the works of God, in the age in which he lived, and all his philosophical pursuits were consecrated to the service of religion. Among other excellent traits in his character, *humility* was the most conspicuous. "He had about him," says Bishop

Burnet, "all that unaffected neglect of pomp in clothes, lodging, furniture, and equipage, which agreed with his grave and serious course of life," and was courteous and condescending to the meanest of his fellow men. "He had," says the same author, "the profoundest veneration for the great God of heaven and earth, that I ever observed in any person. The very name of God was never mentioned by him without a pause, and a visible stop in his discourse;" and the tenor of his philosophical and theological writings is in complete unison with these traits of character. Sir *Isaac Newton*, too, whose genius seemed to know no limits but those of the visible universe, was distinguished by his *modesty, humility, and meekness of temper*. He had such an *humble* opinion of himself, that he had no relish of the applause which was so deservedly paid him. He would have let others run away with the glory of his inventions, if his friends and countrymen had not been more jealous of his honour than he was himself. He said, a little before his death, "I do not know what I may appear to the world, but to myself I seem to have been only like a boy playing on the sea-shore, and diverting myself in now and then finding a pebble or a prettier shell than ordinary, whilst the great ocean of truth lay all undiscovered before me."

The same sentiment might have been illustrated from the lives of Bacon, Locke, Dr. Boerhaave, Hervey, Nieuwentyt, Ray, Derham, the Abbe Pluche, Bonnet, and other eminent characters, who devoted their stores of knowledge to the illustration of the Christian system. For an extensive knowledge of the operations of God has a *natural tendency* to produce humility and veneration; and wherever it is combined with pride and arrogance, either among philosophers or divines, it indicates a lamentable deficiency, if not a complete destitution of Christian principle, and of all those tempers which form the bond of union among holy intelligences. After the attention of Job had been directed to the works of God, and when he had contemplated the inexplicable phenomena of the divine agency in the material world, he was ashamed and confounded at his former presumption; and, in deep humility, exclaimed, "I have heard of thee by the hearing of the ear; but now mine eye seeth thee; wherefore I abhor myself, and repent in dust and ashes." In accordance with what has been now stated, we find that the most exalted intelligences, who, of course, possess the most extensive views of the works and providential

arrangements of God, are represented as also the most humble in their deportment and as displaying the most profound reverence in their incessant adorations. They "*fall down before Him who sits upon the throne: and cast their crowns before the throne*, saying, Thou art worthy, O Lord, to receive glory, and honour, and power; for thou hast created all things, and for thy pleasure they are and were created." Their moral conduct evinces the same lowly temper of mind. They wait around the throne, in the attitude of motion, with wings outspread ready to fly, on the first signal of their Sovereign's will; they "*do his commandments, hearkening to the voice of his word*," and do not disdain to perform important services, in our wretched world, to the meanest human being who is numbered among "*the heirs of salvation*." In like manner, were we endued with the grasp of intellect, the capacious minds, the extensive knowledge, and the moral powers which they possess, we would also display the same humble and reverential spirit, and feel ashamed of those emotions of vanity and pride, which dispose so many of the human family to look down with contempt on their fellow mortals.

---

If the leading train of sentiment which pervades this volume be admitted, the following general conclusions may be adduced:—That, in conducting the religious instruction of the young, the works of God in the material world, and the most striking discoveries which have been made as to their magnitude, variety, and mechanism, should be frequently exhibited to their view in *minute detail*; as illustrations of the attributes of the Deity, and of those descriptions of his nature and operations contained in the volume of inspiration;—that the books put into their hands should contain, among other subjects, popular and striking descriptions of the facts and appearances of nature;—that seminaries should be established for the occasional instruction of young persons, from the age of 15 to the age of 20 or 30, or upwards, in all those popular branches of natural and moral science which have a tendency to enlarge the capacity of their minds, and to expand their conceptions of the incessant agency of God;—and that the ministers of religion, in their public instructions, should frequently blend their discussions of divine topics with illustrations derived from the scenes of creation and providence.

# APPENDIX,

CONTAINING

## NOTES AND ILLUSTRATIONS.

No. I. p. 23 — *Illustration of the Rate of Motion in the Heavenly Bodies, on the supposition that the earth is at rest.*

THE distance of the sun is about 95 millions of miles; consequently, the diameter of the circle he would describe around the earth would be 190 millions, and its circumference 597,142,857, which forms the extent of the circuit through which he would move in 24 hours, if the earth were at rest. This number divided by 24, gives 25,880,952, the number of miles he would move in an hour; and this last number, divided by 60, gives 414,682, the number of miles he would move in a minute. The nearest star is reckon-

ed to be at least 20,000,000,000,000, or twenty billions of miles distant from the earth; consequently, its daily circuit round our globe would measure more than 125,000,000,000,000 miles. This sum divided by 86,400, the number of seconds in a day, would give 1,454,861,111, or somewhat more than one thousand four hundred millions of miles, for its rate of motion in a second of time—a motion which, were it actually existing, would, in all probability, shatter the universe to atoms.

The unlearned reader may, perhaps, acquire a more distinct idea of this explanation from the following figure:

Let the small circle A, in the centre, represent the earth, and the circle B C D E the orbit of the sun, on the supposition that he moves

round the earth every 24 hours. The line A B will represent the distance of the sun from the earth, or 95 millions of miles; the line B D the

diameter of the orbit he would describe; and the circle B C D E the circumference along which he would move every day, or 597 millions of miles, which is somewhat more than three times the diameter. If the line A F represent the distance of the nearest star, the circle F G H I will represent the circuit through which it would move every 24 hours, if the earth were at rest. It is obvious, from the figure, that since the stars are at a greater distance from the earth than the sun, the circle they would describe around the earth would be larger in proportion, and, consequently, their velocities would be proportionably more rapid; since they would move through their larger circles in the same time in which the sun moved through his narrow sphere. But the supposition that the earth is the centre of all the celestial motions, and that the different stars are daily moving around it with different velocities, and the slowest of these motions is so inconceivably rapid—is so wild and extravagant, that it appears altogether inconsistent with the harmony of the universe, with the wisdom and intelligence of the Deity, and with all the other arrangements he has made in the system of nature.

No. II. p. 34.—*Experimental illustrations of the Pressure of the Atmosphere.*

The pressure of the atmosphere is most strikingly illustrated by means of the air-pump. But as few persons, comparatively, possess this instrument, the following experiments, which any person may perform at pleasure, are sufficiently convincing on this point. Take a common wine-glass, and fill it with water; apply a piece of paper over the mouth of the glass; press the paper to the rim of the glass with the palm of the hand; turn the glass upside down; withdraw the hand from the paper, and the water will be supported by the pressure of the atmosphere. That it is the atmospherical pressure, and not the paper, which supports the water, is evident; for the paper, instead of being pressed down by the weight of the water, is pressed upward by the pressure of the atmosphere, and appears concave, or hollow in the middle. If the flame of a candle be applied to the paper, it may be held, for an indefinite length of time, close to the paper, without setting fire to it. The same fact is proved by the following experiment:—Take a glass tube, of any length, and of a narrow bore; put one end of it in a basin of water; apply the mouth to the other end, and draw out the air by suction; the water will immediately rise toward the top of the tube; and if the finger or thumb be applied to the top of the tube, to prevent the admission of air, and the tube removed from the basin of water, the water in the tube will be supported by the pressure of the atmosphere on the lower end. Again:—Take a wine-glass, and burn a small bit of

paper in it; and when the paper is burning press the palm of the hand upon the mouth of the glass, and it will adhere to the hand with considerable force. In this case, the pressure of the atmosphere will be sensibly felt: for it will sometimes require considerable force to detach the glass from the hand.

The pressure of the atmosphere explains a variety of common phenomena. When we take a draught of water out of a basin, or a running stream, we immerse our mouths in the water, and make a vacuum by drawing in the air; the pressure of the atmosphere upon the external surface of the water then forces it into the mouth. The same cause explains the process of a child sucking its mother's breasts—the action of a boy's sucker, in lifting large stones—the rise of water in pumps—the effects produced by cements—the firm adhesion of snails and periwinkles to rocks and stones—the scarcity of water in the time of hard frosts—and the fact that a cask will not run by the cock, unless a hole be opened in some other part of the cask.

No. III. p. 118.—*On the means by which it may probably be ascertained whether the Moon be a Habitable World.*

About six years ago, the author published, in the Monthly Magazine, a few observations on the surface of the moon, in which a few remarks were offered on this subject. The following is an extract from that communication:—

“If we be ever to obtain an ocular demonstration of the habitability of any of the celestial orbs, the moon is the only one, where we can expect to trace, by our telescopes, indications of the agency of sentient or intelligent beings; and I am pretty much convinced, that a long continued series of observations on this planet, by a number of individuals in different places, might completely set at rest the question, ‘Whether the moon be a habitable world?’ Were a vast number of persons, in different parts of the world, to devote themselves to a particular survey of the moon—were different portions of her surface allotted to different individuals, as the object of their particular research—were every mountain, hill, cavern, cliff, and plain accurately inspected—and every change and modification in the appearance of particular spots carefully marked and represented in a series of delineations, it might lead to some certain conclusions, both as to her physical constitution, and her ultimate destination. It can be demonstrated, that a telescope which magnifies 100 times, will show a spot on the moon's surface, whose diameter is 1223 yards; and one which magnifies a thousand times, will, of course, enable us to perceive a portion of her surface, whose size is only 122 yards: and, consequently, an object, whether natural or artificial, of no greater extent

than one of our large edifices, (for example, St. Paul's church, London,) may, by such an instrument, be easily distinguished. Now, if every minute point on the lunar surface were accurately marked by numerous observers, it might be ascertained whether any changes are taking place, either from physical causes, or from the operations of intelligent agents. If a large forest were cutting down—if a city were building in an open plain, or extending its former boundaries—if a barren waste were changing into a scene of vegetation—or, if an immense concourse of animated beings were occasionally assembled on a particular spot, or shifting from one place to another—such changes would be indicated by certain modifications of shade, colour, or motion; and, consequently, would furnish a direct proof of the agency of intelligent beings analogous to man, and of the moon being a habitable globe. For although we may never be able to distinguish the inhabitants of the moon, (if any exist,) yet if we can trace those effects which can flow only from the operations of intelligent agents, it would form a complete demonstration of their existence, on the same ground on which a navigator concludes an unknown island to be inhabited, when he perceives human habitations, and cultivated fields.

"That changes occasionally happen on the lunar hemisphere next the earth, appears from the observations of Herschel and Schroeter, particularly from those of the latter. In the transactions of the 'Society of Natural Philosophy,' at Berlin, Schroeter relates, that on the 30th December, 1791, at five o'clock, P. M. with a seven feet reflector, magnifying 161 times, he perceived the commencement of a small crater on the south-west declivity of the volcanic mountain in the *Mare Crisium*, having a shadow of at least  $2''\ 5$ . On the 11th January, at twenty minutes past five, on looking at this place again, he could see neither the new crater nor its shadow. Again, on the 4th January, 1792, he perceived, in the eastern crater of Helicon, a central mountain, of a clear gray colour,  $3''$  in diameter, of which, during many years' observations, he had perceived no trace. 'This appearance,' he adds, 'is remarkable, as probably from the time of Hevelius, the western part of Helicon has been forming into its present shape, and nature seems, in that district, to be particularly active.'—In making such minute observations as those to which I allude, it would be proper, along with an inspection of the moon's luminous disk, to mark the appearances of different portions of her dark hemisphere, when it is partially enlightened by the reflected light from the earth, soon after the appearance of new moon. These researches would require a long-continued series of the most minute observations, by numerous observers in different regions of the globe, which could be effected only by

exciting, among the bulk of mankind, a general attention to such investigations. But were this object accomplished, and were numerous observations made from the tops of mountains, and in the serene sky of southern climes, where the powers of the telescope are not counteracted by dense vapours, there can be little doubt that direct proofs would be obtained that the moon is a habitable world; or, at least, that the question in relation to this point would be completely set at rest."

#### No. IV.—*Remarks on the late pretended discovery of a Lunar Fortification.*

The British public was lately amused by the announcement of a discovery said to have been made by Professor Fraunhofer, of Munich. This gentleman was said to have discovered a *fortification* in the moon, and to have distinguished several lines of road, supposed to be the work of the lunar inhabitants. It is scarcely necessary to say, that such announcements are obviously premature. To perceive distinctly the shape of an object in the moon, which resembles a fortification, it is requisite, that that object be of a much larger size than our terrestrial ramparts. Besides, although an object resembling one of our fortifications were perceived on the surface of the moon, there would be no reason to conclude, that it served the same purpose as fortifications do among us. We are so much accustomed to war in our terrestrial system, and reflect so little on its diabolical nature, that we are apt to imagine that it must form a necessary employment even in other worlds. To be assured that a fortification existed in the moon for the same purpose as with us, would indeed be dismal tidings from another world; for it would be a necessary conclusion, from such intelligence, that the inhabitants of that globe are actuated by the same principles of depravity, ambition, and revenge, which have infected the moral atmosphere of our sublunary world. With regard to the pretended discovery of the lunar roads, it may not be improper to remark, that such roads behooved to be at least 400 feet broad, or ten times the breadth of ours, in order to be perceived as faint lines through a telescope which magnifies a thousand times; which is a higher power, I presume, than Fraunhofer can apply with *distinctness* to any of his telescopes. It is not at all likely that the lunar inhabitants are of such a gigantic size, or employ carriages of such an enormous bulk, as to require roads of such dimensions, since the whole surface of the moon is only the thirteenth part of the area of our globe.

Schroeter conjectures the existence of a great city to the north of *Marius*, (a spot in the moon,) and of an extensive canal towards *Hygena*, (another spot,) and he represents part of the spot

named *Mare Imbrium*, to be as fertile as the Campania. See *Edin. Phil. Jour.* No. 21, for July, 1824. Similar remarks to those now stated will apply to these conjectures of Schroeter. We are too apt to imagine, that the objects we perceive in the moon must bear a certain resemblance to those with which we are acquainted on the earth; whereas, there is every reason to believe, from the variety we perceive in nature, that no one world resembles another, except in some of its more prominent and general arrangements. The moon bears a general resemblance to the earth, in its being diversified with mountains and valleys; but the positions and arrangement of these objects in the moon, and the scenery they exhibit, are materially different from what appears on the surface of the terraqueous globe.

No. V.—*On the ideas of Magnitude, Motion, and Duration, as expressed by numbers.* See pp. 44, 46.

In the pages referred to, and other parts of this volume, some very large numbers are expressed in *figures*. Some readers have insinuated, that it would have been better to have expressed such numbers in *words*. The author, however, is of a different opinion; because to some readers, not much acquainted with numeration, a thousand *trillions* would convey nearly the same idea as a thousand *nonillions*, though the one number contains 58 places of figures, and the other only 22. It is chiefly the number of figures, or ciphers, in such large sums, that leads us to form a comparative estimate of their value or extent. Our ideas of magnitude and extension, conveyed by such numbers, must, of course, be very vague and undefined. If we have been accustomed to travelling, we have a tolerable clear conception of a *hundred*, and even of a *thousand* miles; but we have no clear nor adequate conception of a body, or a portion of space, ten hundred thousand, ten hundred millions, or ten hundred billions of miles in extent. The mind, however, may be assisted in its conceptions, and in its comparative estimate of different numbers, by fixing on some particular number as a standard. If, according to the common reckoning, we suppose, that 5828 years have elapsed since the commencement of time, the number of seconds, or moments, in this period, will amount to 183,913,782,212, or one hundred and eighty-three thousand nine hundred and thirteen millions, seven hundred and eighty-two thousand, two hundred and twelve, which is less than the fifth part of a billion. If the distance of the nearest stars from the earth be at least 20 billions of miles, then this distance may be otherwise expressed, by saying, that the number of miles which intervene between us and these bodies is more than a *hundred times* greater than the number of moments which have elapsed since

the creation; and, by a similar comparison, it will be found that the number of cubical miles within the limits of the planetary system, is 130,000,000,000,000,000, or one hundred and thirty thousand billions of times greater than the number of moments in 5828 years.

It has been computed, that the earth, supposing it a solid globe, contains about 30,000,000,000,000,000,000,000,000, or thirty septillions of grains of sand, supposing a hundred grains of sand to be equal in length to an inch, and, consequently, a million of such grains for every cubical inch. If we use this number as a standard for estimating the number of cubical miles contained within the space which intervenes between us and the nearest stars, we shall find that the number of cubical miles comprehended within this space, is more than ten thousand millions of times greater than the number of the grains of sand contained in the globe on which we dwell.

Though the human mind can form no definite conceptions of such numbers and magnitudes, yet it may be useful, occasionally, to ruminate on such subjects; as it is the only, or, at least, the principal mode by which limited minds like ours can approximate to an idea of the infinity of the Creator. And if an image of infinity is presented to the mind in the spaces comprehended within the limits of our system, how overpowering the conception of innumerable systems, to which ours bears no more proportion than a drop of water to the mighty ocean! How ineffably glorious must be the attributes of that incomprehensible Being who pervades every part of this vast universe, and who continually superintends all its minute and diversified movements!

No. VI. p. 91.—*On a Plurality of Worlds.*

The doctrine of a plurality of worlds is now admitted as highly probable both by philosophers and by enlightened divines. But it has been admitted by many persons on grounds that are too general and vague, and consequently, a full conviction of its truth is seldom produced in the mind. In different parts of the preceding volume, I have all along taken it for granted, because I consider it as susceptible of a moral demonstration. The following heads of argument, were they fully illustrated, would go far to carry demonstration to the mind on this subject: namely, That there are numerous bodies in the universe of a bulk sufficient to contain myriads of intelligent beings, and to afford them enjoyment—that there appears, in the constitution of many of these bodies, a variety of arrangements evidently adapted to this end—that, in relation to the planets of our system, there are many circumstances which bear a striking resemblance to the constitution of our globe and its appendages. they have annual and diurnal motions,

moons, atmospheres, mountains, and vales—that light, and heat, and colour, appear to be distributed throughout the regions of immensity; and that these agents can have a relation only to the necessities and the happiness of organized intelligences—that every part of nature, so far as our observations on the surface of this globe extend, appears to exist solely for the sake of sentient beings—that this doctrine is more worthy of the Infinite Creator, and gives a more glorious and magnificent idea of his nature, than to suppose his benevolent regards confined to the globe on which we dwell. When these and a variety of other arguments are considered, in connexion with the wisdom and other attributes of the Deity, they amount not only to a high degree of probability, but to something approaching to a moral demonstration. But to illustrate these arguments in a minute detail, so as to make a convincing impression on the mind, would require a volume of a considerable size. The author flatters himself he has some original thoughts on this subject, which may probably see the light should the present work meet with public acceptance. There is no work in our language which takes an extensive view of this subject, in connexion with the attributes of the Deity, and the intimations contained in divine revelation. Fontenelle's "Plurality of Worlds" contains a number of ingenious reasonings; but he treats the subject in too light and flippant a manner, and without the least reference to a Supreme Intelligence. The celebrated Huygens, in his "*Cosmotheoros*," instead of attempting to prove the doctrine of a plurality of worlds, takes it for granted, and indulges chiefly in conjectures respecting the original structure and faculties of their inhabitants.

That the scriptures are silent on this head, has been assumed by some as a presumptive argument that this doctrine is without a solid foundation. I have already endeavoured to show that this assumption is unfounded; (see page 90.) A plurality of worlds is more than once asserted in scripture, and in numerous passages is evidently taken for granted. Celestial intelligences are represented as ascribing "glory, honour, wisdom, and power" to the king of heaven, "because he hath created all things," and because they perceive his works to be "great and marvellous." But if all the great globes in the firmament were only so many frightful deserts, destitute of inhabitants, such a universe could never inspire superior intelligences with admiration of the wisdom of the Creator. For wisdom consists in proportioning means to ends; but, in the case supposed, there would be no proportion between the means and the end. The means are indeed great and astonishing; but no end appears to justify such a display of creating

energy. The psalmist, when he contemplated the heavens, was so affected with the idea of the immense population of the universe, that he seems to have been almost afraid lest he should be overlooked amidst the immensity of beings that are under the superintendence of God. "When I consider thy heavens—what is man that thou art mindful of him!" There would be no propriety nor emphasis in this exclamation, if the heavenly orbs were devoid of inhabitants; for if no intelligent beings exist beside man, and a colony of angels, it would not appear wonderful that the Creator should exercise a particular care over the one-half of his intelligent offspring. But, if we conceive the universe as composed of ten thousand times ten thousand worlds, peopled with myriads of intellectual beings of various orders, the sentiment of admiration implied in the passage is extremely natural and emphatic, and conveys to us an impressive idea of the intelligence, the beneficence, and the condescension of the Founder and Governor of all worlds.

No. VII. pp. 114, 115.—*On the first Inventor of Printing.*

Mr. Ireland, in his "Picturesque Tour through Holland, Brabant, and part of France, in 1789," gives the following account of the inventor of printing, when describing the city of Haerlem.

"Haerlem claims the invention of the art of printing. It is attributed to Lawrence Koster, an alderman of this city, in 1440; whose house is yet standing in the market-place opposite the church. Amusing himself one day in the neighbouring wood, with cutting the bark of trees into the letters that formed the initials of his name, he is said to have laid them on paper, and falling asleep, when he awoke, observed, that from the dew, their form was impressed on the paper. This accident induced him to make further experiments: he next cut his letters in wood, and, dipping them in a glutinous liquid, impressed them on paper, which he found an improvement; and, soon after, substituting leaden and pewter letters, erected a press in his house; thus laying the foundation of this noble art, which has thence gradually risen to its present excellence. The art, it is said, was stolen from him by his servant, John Faustus, who conveyed it to Mentz, and, from the novelty of the discovery, soon acquired the title of doctor and conjuror. The original specimens are now shown at the library in the Town Hall. The first is on a leaf of parchment, and the second and third on paper, printed only on one side, and the corners left blank for capitals. At the top are wooden cuts, representing the creation, and, as it is called, Lucifer's Fall."—Pp. 109—1.

No. VIII. p. 118.—*On Telescopes; with a brief notice of a NEW REFLECTING TELESCOPE, constructed by the author.*

It is doubtful to what particular individual we owe the invention of the telescope. Some have supposed that Roger Bacon and Baptista Porta invented this instrument. Borelli ascribes the invention to Zacharias Jansen, a native of Middleburgh. Perhaps the account given in the article to which this note refers, and which is stated by a variety of authors, may be as probable as any other. It is certain that the telescope was not in general use until the beginning of the 17th century, and that no discoveries in the heavens were made with it, till the year 1609.

There are two kinds of telescopes, *refracting* and *reflecting*. In refracting telescopes, the rays of light pass through convex or concave glasses or lenses. The object-glass is always convex, and forms an image or picture of the object in an inverted position in its focus; which image is viewed by the eye-glass; and the magnifying power is in the proportion of the focal distance of the object-glass to that of the eye-glass. The focal distance of a convex glass may be ascertained by holding it in the rays of the sun, opposite to a piece of white paper, and measuring the distance between the glass and the white spot, or burning point, formed on the paper. An astronomical telescope for viewing celestial objects may be constructed with only two glasses. If an object-glass, 30 inches focal distance, be fixed in the end of a tube, and an eye-glass of one inch focus be placed at the other end, at the distance of 31 inches from the object-glass, a telescope will be formed, which will magnify in the proportion of one to thirty, or 30 times; that is, objects seen through such a telescope will appear thirty times larger in diameter, or thirty times nearer, than to the naked eye. By such an instrument, the inequalities on the moon's surface, and some of the satellites of Jupiter, may be perceived; but when directed to land objects they will appear inverted, or turned upside down. In order to reverse the appearance of the object, two other eye-glasses are required; or, if a concave eye-glass of a similar focus be placed at 29 inches from the object-glass, the object will appear in its natural position, and the magnifying power will be the same; but the field of view will be much smaller. Astronomical telescopes of this construction were formerly made of 120, and even of 200 feet in length, and were used without a tube; the object-glass being placed on the top of a long pole; but these are now entirely superseded by *achromatic* telescopes. In the achromatic telescope, the object-glass is compounded of two, and sometimes of three lenses, placed close to each other, one of which is a double concave of white flint glass, and the other a double convex

of crown glass. By this means an image is formed without being blended with the prismatic colours; and it will, therefore, bear a much greater magnifying power than a common refractor. An achromatic telescope four feet long will magnify objects as much as a common refractor 100 feet long.

In *reflecting* telescopes the images of objects are formed by speculums or mirrors, instead of lenses. They are of two kinds, the *Gregorian* and the *Newtonian*. The Gregorian reflector consists of a tube, in which a concave mirror, having a hole in its centre, is placed. The rays of light from distant objects falling upon this mirror, form an image before it, in its centre or focus. This image is intercepted by a smaller mirror, which reflects it back through the hole in the large mirror, to an eye-glass, through which the observer views the object. In the Newtonian reflector, a plane mirror, placed at an angle of 45 degrees, is substituted in place of the small mirror in the Gregorian construction, and the observer looks down upon the object through the side of the tube. Dr. Brewster has suggested an interesting improvement in the construction of this instrument, which is described in the *Edinburgh Ency. Art. Optics*, p. 644.

*New Reflector.*—About three years ago, the author commenced a series of experiments on reflecting telescopes; and has lately constructed several on a new plan and principle. In this construction, there is no small speculum, either plane, convex, or concave; there is no tube, except a short one of two or three inches in length, for holding the speculum. The observer sits with his back to the object, and views the image formed by the speculum through an eye-piece, which requires to be nicely directed and adjusted. Three or four instruments of this construction have been fitted up, with specula of 5, 8, 16, 26, 35, and 49 inches focal distance. One of them, having a speculum of eight inches focus, and two inches diameter, with a terrestrial eye-piece, magnifying about 25 times, forms an excellent parlour telescope for viewing land objects, and exhibits them in a brilliant and novel aspect. When compared with a Gregorian of the same size and magnifying power, the quantity of light upon the object appears nearly doubled, and the image is *equally distinct*. It represents objects in their natural colours, without that dingy and yellowish tinge which appears when looking through a Gregorian. Another of these instruments, having a speculum of 28 inches focal distance, and an eye-piece producing a magnifying power of about 100 times, serves as an excellent astronomical telescope. By this instrument the belts and satellites of Jupiter, the ring of Saturn, and the mountains and cavities of the moon, may be contemplated with great ease and distinctness. By placing the pedestal on the floor of the apart-

ment, when the object is at a high elevation, we can view celestial phenomena with the same ease as if we were sitting at a writing desk reading a book. With a magnifying power of about 40 or 50 times applied to this telescope, terrestrial objects appear extremely bright and well defined. A speculum of 49 inches focal distance, and 6½ inches diameter, has lately been fitted up on the same principle. With magnifying powers of from 100 to 160 times, it exhibits distinct and interesting views of the moon's surface, and of the ring of Saturn, and with a power of 56 times it affords a beautiful view of land objects. The specula used in these instruments are far from being good; being of a yellowish colour, and scarcely half polished, and having large holes in the centre; as they were originally intended for Gregorian reflectors; yet the brightness of vision approaches nearly to that of achromatic telescopes. The experiments which have been made on this subject demonstrate, that a tube is not necessary for a reflecting telescope, when viewing either celestial or terrestrial objects; and, therefore, this construction of the instrument may be denominated, *The Aerial Reflector*. The simplicity of the construction, and the excellence of the performance of these instruments, have been much admired by several scientific gentlemen to whom they have been exhibited. A caveat has lately been lodged at the Patent Office, in the view of taking out a patent for this construction of reflecting telescopes; and a more detailed account of it will probably soon appear in some of the scientific journals.

In the system of *Optics*, lately published in the Edinburgh Encyclopædia, (one of the most luminous and comprehensive treatises which has yet appeared on this subject,) the writer, in his introduction to the account of Dr. Brewster's improvement on the Newtonian telescope, remarks:—"If we could dispense with the use of the small specula in telescopes of moderate length, by inclining the great speculum, and using an oblique, and, consequently, a *distorted* reflection, as proposed first by La Maire, we should consider the Newtonian telescope as perfect; and on a large scale, or when the instrument exceeds 20 feet, it has undoubtedly this character, as nothing can be more simple than to magnify, by a single eyeglass, the image formed by a single speculum.—As the *front view* is quite *impracticable*, and, indeed, *has never been attempted* in instruments of a small size, it becomes of great practical consequence to remove as much as possible the evils which arise from the use of a small speculum," &c.—The instruments noticed above have effected the desirable object alluded to by this respectable writer; and the principle of the construction is neither that of Dr. Herschel's *front view*, nor does it coincide with that proposed by La Maire, which seems to have been a mere hint, which was never put into execution.

#### No. IX. p. 256.—On Steam Navigation.

The application of steam, as a mechanical power for impelling vessels along rivers and seas, is one of the most brilliant and useful achievements of art which distinguish the present age and seems destined to produce an important and interesting change in the general intercourse of nations. From the "Report of a Committee of Parliament," published in 1822, it appears, that the first application of steam to the impelling of vessels was made by an Englishman, of the name of Hull, who, in 1736, obtained a patent for the invention of a steam-boat, to be moved with a crank and paddles. But it was only in 1807, that the invention was fairly brought into practical use, by Mr. Fulton, an American, who had the assistance and advice of Mr. Bell, a Scots engineer. There are now, according to Mr. Perkins' statement, about 300 steam-boats on the rivers, bays, and coasts of the United States, varying in their size from 100 to 700 tons. In Britain, the first successful application of steam to vessels was made by the above-mentioned Mr. Bell,\* who built the *Comet* of 25 tons, and four horses' power, to ply on the Clyde. There are now reckoned about 150 steam-boats, from 40 to 500 tons, plying on the rivers and coasts of the British isles. Glasgow, which had the honour of introducing steam navigation on this side of the Atlantic, is still the seat of its greatest activity. According to a statement given in the "Edinburgh Philosophical Journal," published in July, 1822, there were then no less than 36 steam-boats, of various sizes, plying on the Clyde. Some of these, besides performing regular voyages to Inverary, Campbeltown, Belfast, Liverpool, and other places, are also performing tours, during the summer months, to the Giant's Causeway, Staffa, Skye, and other ports of the Western isles, and to Inverness by the Caledonian canal. Steam-boats are also plying between Aberdeen and Leith—between Newhaven and Aberdour, Bruntisland, Kinghorn, Kirkcaldy, and Dysart; and to Queensferry, Alloa, Grangemouth, and Sterling—between Leith and London—Dover and Calais. One has been plying for several years on Loch-Lomond, which enables the traveller, at a small expense, to take an interesting view of the diversified scenery of that beautiful lake. Five are just now plying on the Tay; two of which, with engines of 30 and 40 horse powers, and fitted up with elegant accommodations ply daily between Perth and Dundee; each of them, during

\* It is much to be regretted, and it is certainly not congenial to the liberal spirit of the age, that this gentleman, who was among the first inventors of steam navigation, and who has done so much to promote its success in the neighbourhood of Glasgow, has never received any public reward for his exertions, and has been left to sink into a state approaching to poverty.

most of the summer months, transporting nearly a hundred passengers at every trip.

Steam navigation, though less understood on the Continent than with us, is now beginning to make considerable progress. There are 8 steam-boats on the Garonne, and several on the Seine. There are two on the Lake of Geneva, and two are about to be established on the Lake Constance, and there are, besides, one or two on the Danube. It is likely, that in the course of a few years such conveyances will be established on all our friths and rivers, and the period is, no doubt, hastening on, when excursions will be taken, in such vehicles, between Europe and America. A steam-boat of 700 tons burden, and 100 horse power, has sailed regularly, summer and winter, for three or four years, between New-York and New-Orleans, a distance of 2000 miles, in an open sea, exposed to great storms; and, by many, she is preferred to the packets, not only for the certainty of making shorter voyages, but on account of greater safety. In America, steam vessels are fitted up with every accommodation and elegance which art can devise; so as to produce, if possible, as great a variety of enjoyment to passengers on sea as on land. Mr. Church, the American consul in France, has invented a paddle, which revolves on the paddle wheel, by very simple mechanism, which is found to save power. In the United States, a new mode of constructing cabins has been lately introduced, so as to place them beyond the reach of injury from explosions of the boiler. A steam vessel of a large size has lately been fitted up, which is intended to sail between London and Calcutta.

"Steam vessels have been built in this country of from 10 to 500 tons, and from 3 or 4 to 110 horse power. The length of the City of Edinburgh, on the upper deck, is 143 feet; and some have lately been constructed of still larger dimensions. The American steam-boats are larger than ours, and are much more used for the conveyance of merchandise. The Frontinac, which plies on the Canadian side of Lake Ontario, is 170 feet long on deck, and 32 feet broad; and the Chancellor Livingston, which plies on the Hudson, is of the same size. The velocity aimed at is generally 8 or 9 miles an hour. The proportion is, on an average, about one horse power for every four tons of burden, computed in the usual way. The velocity is found to be nearly as the square root of the power, so that an 80 horse power engine will produce only twice the velocity of one of 20 horse power. Something depends also on the make and size of the vessel. The "Sovereign," of 210 tons, and 80 horse power, goes 9½ miles an hour in still water; and the "James Watt," of 448 tons, and 100 horse power, is stated to go 10 miles. For the paddle-boards, the rule is, that 3-10ths of a square foot

of surface should be immersed in the water for each horse power. The paddle wheels vary from 10 to 15 feet in diameter, dip from 12 to 20 inches in the water, and have about one foot in breadth for each 10 horse power. Mr. Gladstone affirms, that so much power is wasted in displacing the water by the stroke of the board, that the velocity of the ship is only about one-half of that of the outer surface of the paddle-wheel.

"There are two sources of apprehension in steam-boats—fire, and the bursting of the boiler. With regard to the latter, when the boiler is of low pressure, it is satisfactorily established that not the smallest danger exists. And in the best constructed vessels, the danger from fire is completely obviated, by separating the furnace from the sides of the vessels by five inches of water."

The power of steam is now rendered subservient to the breaking of stones for the construction of roads. The stones are put into a kind of hopper above, and pushed down with a rake, and the machine is worked by a rotatory motion of one horse power; and will break a ton of hard pebbles completely, in from six to eight minutes. A steam machine has also been invented for the dressing of woollen cloth, which does as much work in 50 minutes as two men could do in two days. *Men. Mag. Aug. 1823, p. 71.*—A steam carriage, for conveying goods and passengers on land, was lately constructing by Mr. Griffiths. Its rate of motion, on common roads, is estimated at five miles an hour, at an average; about three miles when going up hill, and above seven when running down. But pecuniary embarrassments, or other impediments, have, hitherto, prevented the completion of his design.

Mr. Perkins has lately made improvements on the steam engine, which promise to carry its powers to a high degree of perfection. The engine he has lately constructed is calculated to a ten horse power, though the cylinder is no more than two inches in diameter, and 18 inches long, with a stroke of only 12 inches. Although the space occupied by the engine is not more than six feet by eight, yet Mr. P. considers the apparatus (with the exception of the working cylinder and piston) as perfectly sufficient for a thirty horse engine. When the engine performs full work, it consumes only two bushels of coal in the day. Mr. Perkins has also announced a discovery still more extraordinary, viz. that he has been able "to arrest the heat, after it has performed its mechanical functions, and actually pump it back to the generator, to unite with a fresh portion of water, and renew its useful labours." A particular account of Perkins's engine accompanied with an engraving, is given in the *Edin. Philos. Journal*, No. 17, for July 1823. The pretensions of Mr. Perkins, however, have not yet been so fully substantiated by experiment as to satisfy the anxious expectation of the public.

An interesting report has lately been published of a series of experiments, made with a new steam engine, invented by an American machinist, called the *capillary steam engine*. Three great objects are said to be accomplished by this invention, *lightness, safety, and economy of fuel*. In an engine calculated for a four horse power, the generator is formed of a copper tube  $\frac{1}{4}$  inch in diameter, and 100 feet long, which weighs about 16lbs. It is arranged in coils, one above another, in the form of a sugar loaf, 30 inches high; the bottom coil being 18 inches in diameter, and the top one considerably less. The wood is prepared as is usual for a stove, and put within the coils. The steam cylinder is formed of sheet copper, three inches in diameter, 27 inches in stroke, and, with all its appendages, weighs about 25lbs. It has been ascertained, that the generator and main cylinder, with their contents and appendages, exclusive of fuel, need not weigh more than 20lbs. to the horse power. *No harm can be done by the bursting of boilers*—even a safety-valve is considered as useless. In the course of the experiments, the experimenters several times burst the tube; but, so far from doing any injury, it could not always be perceived by the spectators. To ascertain what may be done towards aerial navigation, by steam, experiments were made on the power of wings in the air, and on the power necessary to work them. The result is, that it requires a horse power to carry 30lbs. in the air; so that a flying engine, to be worked by charcoal, would weigh about 30lbs. to the horse power, wings, condenser and fuel included. It was also ascertained by experiments and calculations, that a balloon could be made to carry a man with an engine, which would push it at the rate of 15 miles an hour in the air. A more particular detail of these experiments may be seen in the "London Mechanics' Magazine," No. 60, for 16th October, 1824.

No. X. p. 146.—*Strictures on a certain sentiment respecting the work of Human Redemption.*

The sentiment referred to in this paragraph, "That there never was, nor ever will be, through all the ages of eternity, so wonderful a display of the divine glory, as in the cross of Christ," has been reiterated a thousand times, in sermons and in systems of divinity, and is still repeated by certain preachers, as if it were an incontrovertible axiom, which ought never to be called in question; and is, no doubt, intended to magnify the divine attributes, and the work of redemption.\* But it is nothing more than a

\* It is not important to determine how often the sentiment here expressed has been "reiterated in sermons and systems of divinity." We cannot, however, believe that it has been repeated with the same frequency as the author's language seems to imply. That there are instances, in which it was designed

presumptuous assumption, which has a tendency to limit the perfections of Deity, and to present a partial and distorted view of the economy of human redemption. For, in the first place, it has no foundation in Scripture. There is not a single passage from which it can be legitimately deduced. The *onus probandi*, on this point, rests with those who make the assertion. A gentleman, when lately conversing on this subject, brought forward the following interrogation, as a demonstrative argument in proof of the position in question: "Is not redemption declared in Scripture to be the chief of all the works of God?" but he was not a little surprised, when he was informed that the passage, which he had partly misquoted, is applied to the behemoth or the elephant, as stated in Job xl. 19.—2dly, the assertion is as presumptuous as it is unfounded. It takes for granted, that we know all the events which have already happened, and which are now taking place throughout the whole range of God's universal empire. This empire appears unbounded; and that portion of it which we can minutely explore, is but as a point in comparison
